To Our Readers

Changes: Readers of this publication are encouraged to submit suggestions and changes that will improve it. Recommendations may be sent directly to Commanding General, Marine Corps Combat Development Command, Doctrine Division (C 42), 3300 Russell Road, Suite 318A, Quantico, VA 22134-5021 or by fax to 703-784-2917 (DSN 278-2917) or by E-mail to **nancy.morgan@usmc.mil**. Recommendations should include the following information:

- Location of change
  - Publication number and title
  - Current page number
  - Paragraph number (if applicable)
  - Line number
  - Figure or table number (if applicable)
- Nature of change
  - Add, delete
  - Proposed new text, preferably double-spaced and typewritten
- Justification and/or source of change

Additional copies: A printed copy of this publication may be obtained from Marine Corps Logistics Base, Albany, GA 31704-5001, by following the instructions in MCBul 5600, *Marine Corps Doctrinal Publications Status.* An electronic copy may be obtained from the Doctrine Division, MCCDC, world wide web home page which is found at the following universal reference locator: **https://www.doctrine.usmc.mil**.

Unless otherwise stated, whenever the masculine gender is used, both men and women are included.

Headquarters United States Marine Corps
Washington, DC 20380-1775

30 July 2004

FOREWORD

Marine Corps Warfighting Publication (MCWP) 2-2, *MAGTF Intelligence Collection*, builds on the doctrinal foundation established by Marine Corps Doctrinal Publication (MCDP) 2, *Intelligence,* and Marine Corps Warfighting Publication (MCWP) 2-1, *Intelligence Operations*, detailing specific doctrine and tactics, techniques, and procedures (TTP) to conduct intelligence collection to support the Marine air-ground task force (MAGTF).

MCWP 2-2 is primarily for intelligence personnel who plan and execute intelligence collection activities. Personnel who support intelligence collection activities or use their results may also find this publication useful.

Reviewed and approved this date.

BY DIRECTION OF THE COMMANDANT OF THE MARINE CORPS

EDWARD HANLON, JR.
Lieutenant General, U.S. Marine Corps
Deputy Commandant for Combat Development
Marine Corps Combat Development Command

Publication Control Number: 143 000148 00

CHAPTER 1
FUNDAMENTALS

Intelligence collection is the acquisition of information and the provision of this information to processing elements (Joint Publication [JP] 1-02, *Department of Defense Dictionary of Military and Associated Terms*). In Marine Corps usage, collection is the gathering of intelligence data and information to satisfy the identified requirements (MCRP 5-12C, *Marine Corps Supplement to the Department of Defense Dictionary of Military and Associated Terms*). Successful MAGTF intelligence collection seeks to help reduce uncertainty regarding the enemy, weather, terrain, and operational environment. MAGTF intelligence collection activities form detailed intelligence collection requirements (ICRs), task organic collection assets, and request external collection resources to satisfy the warfighting commander's priority intelligence requirements (PIRs) and other intelligence requirements (IRs).

Intelligence Staff (G-2/S-2) Responsibilities

The intelligence staff (G-2/S-2) has responsibility for intelligence and intelligence operations. The commander relies on the intelligence officer to provide information on weather, terrain, and enemy capabilities, status, and intentions. Through the intelligence annex and supporting appendices, the G-2/S-2 does the following:

- Validates and plans information requirements.
- Coordinates intelligence priorities.
- Integrates collection, production, and dissemination activities.
- Allocates resources.
- Assigns specific intelligence and reconnaissance missions to subordinate elements.
- Supervises the overall intelligence, counterintelligence (CI), and reconnaissance efforts.

See also MCWP 3-40.1, *Marine Air-Ground Task Force Command and Control*, and MCWP 2-1, *Intelligence Operations*.

Specific G-2/S-2 Responsibilities

- Develops and answers outstanding intelligence-related PIRs.
- Prioritizes PIRs and IRs by planning, directing, integrating, and supervising organic multidiscipline MAGTF and supporting intelligence operations.
- Prepares appropriate intelligence, CI, and reconnaissance plans and orders:
  - Reviews and coordinates the all-source intelligence, CI, and reconnaissance plans of joint task forces (JTFs), theaters, and other organizations.
  - Submits and coordinates all-source collection, production, and dissemination requirements beyond the capability of the MAGTF through higher headquarters for JTF, theater or national intelligence support.
- Ensures intelligence information is rapidly processed, analyzed, and incorporated where appropriate in all-source intelligence products, and rapidly disseminates to all MAGTF and external units requiring these.
- Evaluates JTF, theater, and national all-source intelligence support and adjusts stated IRs.
- Identifies deficiencies in intelligence, CI, and reconnaissance personnel and equipment resources.
- Incorporates exercise intelligence in training exercises to improve individual, collective, and unit readiness.
- Facilitates understanding and use of intelligence in support of the planning and execution of operations.

Special Staff Officers under Staff Cognizance of the G-2 Officer

G-2 Operations Officer

The G-2 operations officer has primary responsibility for intelligence support to current and future operations. Specific responsibilities include the following:

- Coordinates and provides intelligence support to the commander, the G-3 operations section, and the rest of the commander's battle staff.
- Serves as the G-2 representative to the MAGTF command element (CE) crisis action team.
- Coordinates, provides, and supervises intelligence support to the MAGTF CE, combat operations center, future operations center, and force fires.
- Plans, directs, and supervises the red cell.
- Provides recommendations on PIR and IR validation, prioritization, and tasking to the G-2 and the intelligence support coordinator (ISC).
- Coordinates and supervises the transition of intelligence planning and operations from G-2 plans to G-2 future operations, and from G-2 future operations to G-2 current operations to effectively support operations.
- Plans, directs, and supervises MAGTF liaison teams to external commands; e.g., the JTF and joint functional components headquarters and intelligence organizations.
- Coordinates with the ISC and MAGTF major subordinate commands' (MSCs') G-2 operations officers for unity of effort of MAGTF intelligence operations.
- Provides intelligence input and other support to MAGTF warning and fragmentary orders (FRAGOs) and to operations-related reporting; e.g., periodic situation reports.
- Coordinates intelligence training for the MAGTF G-2 section and provides G-2 oversight for and integration of the entire MAGTF intelligence training program.
- Performs other intelligence support and tasks as directed by the G-2.

G-2 Plans Officer

The G-2 plans officer has primary responsibility for intelligence support to the future plans cell. Specific responsibilities include the following:

- Plans the MAGTF concept of intelligence operations for approval by the G-2 and subsequent implementation by the integrated staff cell based on the mission, threat, commander's intent, guidance, and concept of operations.
- Leads, coordinates, and provides intelligence support to G-5 future plans section.
- Plans and coordinates intelligence support requirements for and the deployment of intelligence elements and resources into the area of operations (AO).
- Provides recommendations on PIR and IR validation, prioritization, and taskings to the G-2 and the ISC.
- With the ISC, coordinates G-2 development of Annex B (Intelligence) and Annex M (Geospatial Information and Services) to the operation plan/operation order (OPLAN/OPORD).
- Keeps the G-2 section, other CE staff sections, intelligence liaison personnel, augmentees, and others apprised of MAGTF intelligence planning actions and requirements.
- Identifies requirements and provides recommendations to the G-2 operations officer for MAGTF intelligence liaison teams to external commands; e.g., the JTF or other components' headquarters and intelligence agencies.
- Coordinates and develops policies for intelligence, CI, and reconnaissance operations.
- Plans, directs, and supervises the G-2's imagery and mapping, CI/human intelligence (HUMINT), signals intelligence (SIGINT), and weather sections.

- Performs other intelligence support and tasks as directed by the G-2.

Intelligence Battalion Commander/ISC

The intelligence battalion commander plans, directs, collects, processes, produces, and disseminates intelligence, and provides CI support to the Marine expeditionary force (MEF), MEF MSCs, subordinate MAGTFs, and other commands as directed.

In garrison, the principal task of the intelligence battalion commander is to organize, train, and equip detachments that support MAGTFs or other designated commands to execute integrated collection, intelligence analysis, production, and dissemination of intelligence products.

During operations, the intelligence battalion commander is dual-hatted as the ISC, serving under the direct staff cognizance of the G-2. The S-3 section and the operations center element of the G-2 form the core of the ISC support effort, with planning, direction, and command and control (C2) conducted within the intelligence operation center's (IOC's) support cell. As the ISC, the commander is responsible to the G-2 for the overall planning and execution of all-source intelligence operations. Specific ISC responsibilities during actual operations include the following:

- Implements the concept of intelligence operations developed by the G-2 plans officer and approved by the G-2.
- Establishes and supervises operation of the MAGTF IOC, which includes the support cell, the surveillance and reconnaissance cell (SARC), and the production and analysis (P&A) cell. Generally, the IOC will be collocated with the MAGTF CE's main command post.
- Develops, consolidates, validates, and prioritizes recommended PIRs and IRs to support MAGTF planning and operations. The ISC is tasked to perform PIR and IR validation and prioritization only during actual operations when the IOC is activated. During routine peacetime operations, PIR and IR validation and prioritization tasks are the responsibility of the G-2 operations officer.
- Plans, develops, integrates, and coordinates intelligence collection, production, and dissemination plans. This includes the effective organic and external integration and employment and staff cognizance of SIGINT; CI; HUMINT; geographic intelligence; imagery intelligence (IMINT); ground remote sensors; ground reconnaissance; and tactical air reconnaissance intelligence collections, production, and dissemination operations.
- Develops (with the G-2 plans officer and G-2 operations officer) and completes Annex B (Intelligence) and Annex M (Geospatial Information and Services) to the OPLAN/OPORD.
- Plans, develops, integrates, and coordinates intelligence and CI support to the commander's estimate; situation development; indications and warning; force protection; targeting; and combat assessment.
- Manages and fuses the threat (or red) common operational picture/common tactical picture (COP/CTP) inputs from subordinate units and external commands and intelligence agencies into the COP/CTP.
- Provides intelligence support to the MAGTF G-2 section and the MSCs.
- Prepares the intelligence and CI estimates to support G-2 plans.
- Plans, develops, and coordinates intelligence communications and information systems (CIS) architecture, including its integration with and support of IMINT and other intelligence and reconnaissance requirements.
- Coordinates and integrates all-source intelligence operations with other Service components; the JTF joint intelligence support element; the theater joint intelligence center or joint analysis center; and national intelligence agencies and operations to include all aspects of intelligence reachback support.
- Assists with the evaluation and improvement of all-source intelligence, CI, and reconnaissance operations.

- Provides other intelligence support and tasks as directed by the G-2.

Collection Management/Dissemination Officer

The collection management/dissemination officer (CM/DO) is sourced from the intelligence battalion's S-3 section and is a key subordinate to the intelligence battalion commander/ISC during operations. The CM/DO forms detailed ICRs and intelligence dissemination requirements (IDRs), and tasking and coordinating internal and external operations to satisfy these. The CM/DO receives validated PIRs and IRs and direction from the ISC, and then plans and manages the best methods to employ organic and supporting collection and dissemination resources through the intelligence collection and dissemination plans.

The CM/DO also validates and forwards national and theater intelligence collection requests from the MAGTF and MSCs typically using appropriate intelligence tools and TTP. He also coordinates intelligence CIS requirements and maintains awareness of available CIS connectivity throughout the MAGTF and with key external organizations. During operations, the CM/DO works within the support cell. In coordination with the P&A cell officer in charge (OIC), the SARC OIC, the G-2 operations officer, the intelligence/reconnaissance commanders, and the G-6, the CM/DO is responsible to the ISC for the following tasks:

- Determines and coordinates the collection effort of PIRs/IRs that may be collected via intelligence, CI, and reconnaissance resources.
- Determines PIRs/IRs and prepares requests for intelligence (RFIs) that are beyond organic capabilities; prepares submissions to higher headquarters and external agencies for support.
- Recommends dissemination priorities, develops intelligence reporting criteria, and advises on and selects dissemination means.
- Uses the Collection Management Board (if established) to develops and coordinates all-source intelligence collection plans, and coordinates and integrates these with MAGTF, other components, JTF, theater, and national intelligence production operations.
- Develops and coordinates all-source intelligence dissemination plans and supporting architectures for voice and data networked communications; coordinates and integrates these with MAGTF, other components, JTF, theater, and national intelligence CIS and dissemination operations.
- Monitors the flow of intelligence throughout the MAGTF; ensures that it is delivered to intended recipients in a timely fashion and satisfactorily meets their needs.
- Evaluates the effectiveness of MAGTF and supporting intelligence collection and dissemination operations.

SARC OIC

The SARC OIC is also an immediate subordinate of the ISC and is responsible for supervising the execution of the integrated organic, attached, and direct support (DS) intelligence collection and reconnaissance operations. The SARC OIC is responsible to the ISC for the following:

- Coordinates, monitors, and maintains the status of all ongoing intelligence, CI, and reconnaissance collection operations. This includes the following:
  - Missions, tasked ICRs, and reporting criteria for all collection missions.
  - Locations and times for all pertinent fire support control measures.
  - Primary and alternate CIS plans for routine and time-sensitive requirements (for collectors and between the collectors or the SARC and key MAGTF CE and MSC C2 nodes) to support ongoing C2 of collection operations and dissemination of acquired data and intelligence to those needing it by the most expeditious means.
- Conducts detailed intelligence collection planning and coordination with the MSCs and intelligence, CI, and reconnaissance organizations'

planners, with emphasis on ensuring understanding of the collection plan and specified intelligence reporting criteria.
- Ensures other MAGTF C2 nodes; e.g., the current operations center or force fires, are apprised of ongoing intelligence, CI, and reconnaissance operations.
- Receives routine and time-sensitive intelligence reports from deployed collection elements; cross-cueing among intelligence collectors, as appropriate; and the rapid dissemination of intelligence reports to MAGTF C2 nodes and others in accordance with IRs, intelligence reporting criteria and dissemination plans, and the current tactical situation.

P&A Cell OIC

The P&A cell OIC's primary responsibility is to manage and supervise the MAGTF's all-source intelligence processing and production efforts. Key responsibilities include the following:

- Plans, directs, and manages operations of the all-source fusion platoon to include the fusion, order of battle, intelligence preparation of the battlespace (IPB), and target intelligence/battle damage assessment (BDA) teams; the topographic platoon; the IMINT platoon; DS teams; and other P&A elements as directed.
- Coordinates and integrates P&A cell operations, estimates, and products with the G-2 section's G-2 operations branch and its red cell operations and estimates.
- Maintains all-source automated intelligence databases, files, workbooks, country studies, and other intelligence studies.
- Plans and maintains imagery, mapping, and topographic resources and other intelligence references.
- Administers, integrates, operates, and maintains intelligence processing and production systems and unclassified general service (message) and sensitive compartmented information systems; e.g., the intelligence analysis system or the image product library.
- Analyzes and fuses intelligence and other information into tailored all-source intelligence products to satisfy all supported commanders' stated or anticipated PIRs and IRs.
- Develops and maintains current and future intelligence situational, threat, and environmental assessments and target intelligence based on all-source analysis, interpretation, and integration.
- Manages and fuses the threat (or red) COP/CTP inputs from subordinate units and external commands and intelligence agencies into the COP/CTP.

For additional information on staff and unit intelligence responsibilities, see MCWP 3-40.1 and MCWP 2-1.

MEF MSC and Unit Responsibilities

Intelligence collection responsibilities also extend to MEF MSCs and units. Key tasks of the MEF MSC intelligence officers include the following:

- Consolidates, validates, and prioritizes MSC IRs and collection needs.
- Submits consolidated requests for external intelligence support.
- Coordinates intelligence activities within their unit.

The unit intelligence officer is generally responsible for the following tasks:

- Coordinates with unit production personnel to verify that the needed information or intelligence is not already available.
- Identifies requirements beyond the unit's capability to satisfy. The unit intelligence section identifies requirements it cannot satisfy internally and forwards these up the chain of command for satisfaction. Detailed justification and the latest time intelligence is of value (LTIOV) should be included so that ICRs can successfully compete with other ICRs for priority collection support.

- Develops unit intelligence collection plans, which must be thoroughly coordinated and integrated with the unit's intelligence production and dissemination plans. Ensures the intelligence plan is responsive to operational needs by analyzing incoming information, determining its value and relevance, and refining future collection needs.
- Integrates collection operations with unit maneuver, fires, communications, and logistics operations. To be effective, collection operations must be coordinated with other operations of the command.
- Plans and supervises operations of organic collection assets and coordinating internal support; e.g., communications, logistics, and security.

MAGTF Intelligence and Reconnaissance Collection Assets

Intelligence data and information are collected by a wide range of MAGTF intelligence and reconnaissance assets. These assets include, but may not be limited to, the following:

- Marine tactical electronic warfare (EW) squadron (VMAQ).
- Radio battalion.
- CI/HUMINT company.
- Ground sensor platoon (GSP).
- Force reconnaissance company.
- Light armored reconnaissance battalion.
- Unmanned aerial vehicle (UAV) squadron.
- Ground combat element reconnaissance battalion/company/platoon.
- Joint surveillance target attack radar system (JSTARS) common ground station.
- F/A-18D reconnaissance capable with advanced tactical airborne reconnaissance system (ATARS).

For additional information on unit capabilities, see the following MCWPs:

- 2-14, *Counterintelligence* (CI/HUMINT).
- 2-15.1, *Remote Sensor Operations* (GSP).
- 2-15.2, *Signals Intelligence* (radio battalion).
- 2-15.4, *Imagery Intelligence* (JSTARS).
- 3-26, *Air Reconnaissance* (F/A-18D ATARS).
- 3-40.5, *Electronic Warfare* (VMAQ and radio battalion).
- 3-42.1, *Unmanned Aerial Vehicle Operations* (UAV).

Intelligence Collection within the Marine Corps Intelligence Cycle

The process used to develop intelligence is called the intelligence cycle. See figure 1-1. The Marine Corps intelligence cycle consists of six sequential yet interdependent steps: planning and direction; collection; processing and exploitation; production; dissemination; and utilization. Collection is the second step, yet collection management is a continuing process and occurs concurrently throughout the cycle. Intelligence collection is a process that helps identify and validate IRs, prioritize them, determine effective means for acquiring information to help satisfy them, and develop, execute, and supervise intelligence and reconnaissance operations.

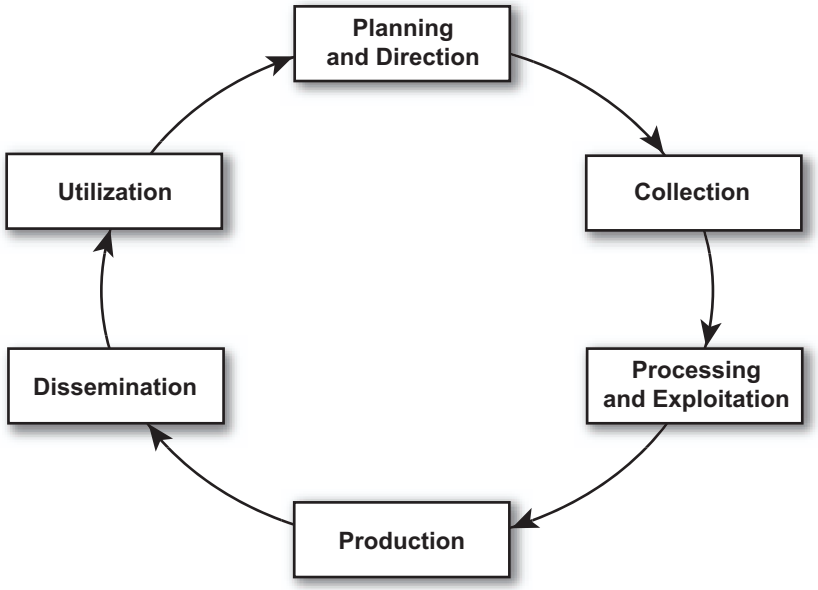

Figure 1-1. The Marine Corps Intelligence Cycle.

Collection Principles

Collection managers may use the following general principles when planning and executing intelligence collection activities. See also JP 2-01, *Joint Intelligence Support to Military Operations*.

Early Involvement

A collection manager must get involved with IRs identification and management early in planning. This ensures thorough consideration and increased flexibility in choosing intelligence collection assets and resources, enhancing the quality and timeliness of collected information.

Prioritization

Prioritization assigns a distinct ranking to each collection requirement. Prioritization must be based on the commander's guidance and the current situation to ensure that assets/resources are directed against the most critical requirements.

Multidiscipline Approach

Collection managers must avoid overreliance on a single collection system or intelligence discipline. Each intelligence collection asset/resource has unique strengths and weaknesses. However, each asset's limitations can be mitigated through the capabilities of other resources. Overreliance on a single asset may result in mission failure if that asset becomes unavailable or the adversary can ascertain its employment pattern and implement countermeasures. A fully integrated collection plan uses collection resources in a complementary manner, adding depth to collection activities.

Task Organic Assets First

Use of organic collection assets allows a timely and tailored response to collection requirements and lessens the burden on collection resources controlled by other units, agencies, and organizations. However, if the requirement cannot be satisfied with organic assets, the collection manager should not hesitate to request external collection

support. The collection manager should have an integrated collection plan, including national, theater, and organic collection assets, to ensure ICRs are collected in a timely, accurate manner.

Collection Management Process

Collection management is, in intelligence usage, the process of converting intelligence requirements into collection requirements, establishing priorities, tasking or coordinating with appropriate collection sources or agencies, monitoring results and retasking, as required (JP 1-02). Its purpose is to effectively collect all required intelligence while ensuring the best use of limited and valuable collection assets.

There are two distinct phases of collection management: *collection requirements management (CRM)*, defining what information collections disciplines must collect; and *collection operations management (COM)*, specifying how the collection disciplines will collect. CRM focuses on the IR, is all-source oriented, and generally interacts with intelligence production elements. COM focuses on selecting the specific intelligence disciplines and specific assets to be used to collect information that satisfies IRs. COM establishes a collection strategy and determines how to collect against requirements.

In the MAGTF, CRM and COM are planned, directed, and coordinated by the MAGTF G-2/S-2. However, each MAGTF element has an intelligence staff officer and performs collection management functions. Each unit interacts with levels above and below, and among units, organizations, and agencies on the same level. The further up the chain, the broader the perspective and scope of responsibility and the more organic collection assets and access to collection resources; the lower down the chain, the more specific the function and narrow the scope of collection activities.

CHAPTER 2
COLLECTION REQUIREMENTS MANAGEMENT

Properly articulated, mission-oriented requirements focus the intelligence effort and provide the foundation for successful MAGTF intelligence collection operations.

CRM is the authoritative development and control of collection, processing, exploitation, and/or reporting requirements that normally result in either direct tasking of assets over which the collection manager has authority, or the generation of tasking requests to collection management authorities at a higher, lower, or lateral echelon to accomplish the collection mission (JP 1-02).

CRM focuses on the requirements of the commander, planner or supported units, is oriented at providing all-source intelligence, and generally interacts with intelligence production elements.

CRM organizes, prioritizes, validates, and manages the ICRs that the collection effort must fulfill. CRM is designed to ensure the high priority ICRs get the attention they deserve and determine what specific collection operations and characteristics must be planned and executed to answer these. CRM begins with initial efforts to determine and answer the commander's PIRs established during the planning and direction phase of the intelligence cycle. The compilation of ICRs is the basis for the collection plan. CRM works in cooperation with COM. During CRM a plan is developed to satisfy the requirements, which then transitions to COM for execution. During execution, CRM continues by checking with those supported to determine whether collection operations are actually satisfying their IRs. The CRM process is used to derive, organize, state, and manage IRs.

Requirements Analysis Criteria

IRs are developed as the commanders and staffs work through the Marine Corps Planning Process. Even in the early stages of mission analysis, the collection manager has compiled a number of questions submitted by the staffs and subordinate commanders. In his initial attempts to organize the collection effort, the collection manager analyzes all ICRs he has received. The collection manager helps identify ICRs that can be answered by currently available intelligence and those that will be incorporated in the collection plan. Criteria used to determine the questions that will be converted into collection tasks will be situation-dependent.

Pertinence

Pertinence demands that only ICRs that are relevant to current operations or operations being planned should be planned and executed. Often a proactive commander or staff may submit an ICR in support of an anticipated but not actually assigned follow-on mission or other nonmission-essential task. The collection manager ensures that only relevant ICRs are acted on.

Feasibility

Feasibility demands that only those ICRs that actually can be collected on should be planned and executed. This refers to MAGTF or supporting assets/resources' ability to perform the collection mission, and also to the existence of collectible or "observable" data that the collector will be able to observe, update, and report.

Completeness

Completeness demands that a proposed ICR is complete; i.e., does it ask only one question? The IR should focus on a specific fact, activity or event. The collection manager should identify those questions that are incomplete and coordinate with the originating commander or staff section for refinement. Collection managers must make all efforts to assist commanders and staffs in drafting questions and refining them if returned.

Validation

Validation checks if the proposed ICR has already been answered and/or if it duplicates existing IRs and ICRs. Questions that pass this criterion are said to be "validated." For those not passing this test, collection personnel will initiate coordination with the production element.

Priority

Priority demands that difficult decisions be made regarding the relative importance of some IRs and PIRs compared to others. PIRs must be rank-ordered by the commander in terms of their relative importance to his decisionmaking. There are no "ties" in PIR priorities. If everything is top priority, then effectively nothing is a priority. All IRs that are not designated PIRs but pass all other criteria likewise must be prioritized. The collection manager must prioritize these also, rank-ordering requirements against each other. The collection manager should do the following:

- Always reprioritize dynamically. The collection manager must have a system in place that allows easy reprioritization based on the commander's guidance and tactical needs.
- Keep the commander informed. It is important that the commander knows when a PIR from a subordinate commander will receive lower priority.
- Be prepared to justify priorities. The collection manager must be prepared to explain what factors influenced the prioritization decisions. Commanders and intelligence officers on other staffs should understand the rationale for the prioritization.
- Continuously communicate current priorities and justifications. Using a database or spreadsheet, subordinate units should be able to monitor the status of their requirements and assess priorities and planned operations. The MAGTF CE should publish and disseminate an updated list as part of an intelligence summary or other periodic product in message format to help lower-echelon commanders and units maintain awareness of higher headquarters' plans and operations. This will also provide an opportunity to adjust for changes in critical situations.

Intelligence Requirements

Intelligence gaps or information needs are formally labeled intelligence requirements. An intelligence requirement is any subject, general or specific, upon which there is a need for the collection of information, or the production of intelligence (JP 1-02). In Marine Corps usage, questions about the enemy and the environment, the answers to which a commander requires to make sound decisions (MCRP 5-12C). IRs drive the collections process and the overall intelligence cycle. IRs are initially developed during the planning process. These are the relevant IRs, related to the enemy, threat or battlespace environment, that commanders deem essential for the successful accomplishment of the mission. IRs are categorized as PIRs and IRs.

PIRs are those intelligence requirements for which a commander has an anticipated and stated priority in the task of planning and decisionmaking (JP 1-02). In Marine Corps usage, an intelligence requirement associated with a decision that will critically affect the overall success of the command's mission (MCRP 5-12C). PIRs are prioritized among themselves and may change in priority over the course of an evolution. Only the commander designates PIRs.

Generally, the difference between a PIR and an IR is that a commander must have the answer to the PIR to make a decision. At any one time there are not many PIRs in effect.

The lowest priority PIR takes precedence over the highest priority IR. IRs are questions typically generated by the staff but not ones that the commander feels he needs answered before making decisions. While there are ideally a few PIRs, there may be many IRs. Like PIRs, IRs should be prioritized against each other to support effective intelligence planning and operations.

PIRs and IRs have the following characteristics. Each PIR or IR—

- Asks only one question.
- Focuses on specific facts, events or activities concerning the enemy or the battlespace.
- Is tied to mission planning, decisionmaking, and execution.
- Provides a clear, concise statement of what intelligence is required.
- Contains geographic and time elements to limit the scope of the requirement.

See also MCWP 2-1.

Requirements Management

Management of IRs is a dynamic process that encompasses the continuous evaluation of the following:

- The importance of each requirement to mission success.
- Continued relevance based upon the current situation and plans.
- Information and assets needed to satisfy each requirement.
- Resources that are presently committed toward fulfilling that requirement.
- The degree to which the requirement has been satisfied by intelligence activities.

Processing IRs

Development of IRs and designation of PIRs is continuous. There is a dynamic flow of new IRs—existing requirements are satisfied or are no longer relevant—and the relative importance of each requirement changes as planning, decisionmaking, execution, and assessment progress. As IRs are developed, the collection manager validates, refines, and enters them into the collection management system.

Validating IRs

Validation ensures that the IR is relevant to the mission, has not already been satisfied, and does not duplicate any other requirements.

Refining IRs

Refining the IR entails placing it in the proper format, identifying all related information components, and adding appropriate qualifiers such as geographic limitations or time constraints. During refinement, similar or related IRs may be combined into a single, comprehensive IR.

Managing IRs System

A requirements management system is an essential tool that provides a means to monitor the effort to satisfy each IR. Each intelligence section must develop a system appropriate to its mission and echelon. Minimal components of any IR management system follow:

- A numbering system.
- Identifying who submitted the requirement.
- Designating collection and production assets committed to satisfying the IR or noting when the IR was submitted to higher headquarters or supporting agencies, if organic assets are not available.
- Timeliness requirements.
- Dissemination instructions and information.
- A mechanism to track user satisfaction.

Reviewing Priorities

The collection manager must continually reassess the emphasis given to each IR and realign the priorities according to the commander's intent, current situation, and the planning cycle phase. The intelligence officer must also periodically confirm the assignment of priorities with the commander to ensure that the intelligence effort is focused in accordance with the commander's desires. In addition to IRs of his own command, the collection manager usually receives requests for information from outside agencies (subordinate, adjacent, and senior). Given that MAGTF intelligence operations are centrally managed by the MAGTF CE, the collection manager must continually solicit, assess, and integrate the IR needs of subordinate commanders.

Satisfying IRs

Once an IR has been identified, validated, refined, and prioritized, the collection manager must determine how to satisfy it and allocate the appropriate intelligence and reconnaissance assets to obtain the desired information and intelligence. If the IR cannot be satisfied by organic assets, it must be submitted to higher headquarters or supporting forces/agencies for satisfaction. In determining how to satisfy an IR, the collection manager must consider each step in the intelligence cycle to ensure that the plan encompasses the entire process from collection through utilization. In conjunction with the P&A cell OIC and the CM/DO, the collection team must identify the information needed, where and how to get it, how to package the intelligence into an appropriate product, and how to deliver that product.

Normally, an IR will generate tasks to collect data or information; process/produce tactical intelligence to answer the question; and disseminate the intelligence to all users needing it by a specific time.

Organizing the Collection Effort Around Requirements

Each IR will generally have an associated ICR, intelligence production requirement (IPR), and IDR. See figure 2-1. However, in practice, an intelligence development effort is rarely concentrated on a single IR. Normally, related IRs are grouped together and synchronized to ensure that intelligence operations are focused on the PIRs and satisfy as many IRs as possible. This grouping also helps with the need to employ intelligence resources in the most effective and efficient manner.

Assets/resources to requirements must be matched. Once the ICRs, IPRs, and IDRs have been identified, the intelligence officer allocates the necessary collection, processing and exploitation, production, and dissemination assets to carry out the task.

Collection agencies and production requirements must be assigned. The remainder of the planning and direction effort entails managing the intelligence effort to ensure that intelligence assets stay focused on the PIRs and that the results are being delivered and used to effect tactical decisions. Principles of assigning collection agencies and analytical production to requirements include the following:

- Requirement research: to ensure previously acquired/developed intelligence does not answer current requirements, to include exploiting ongoing/planned collection operations of other friendly forces.

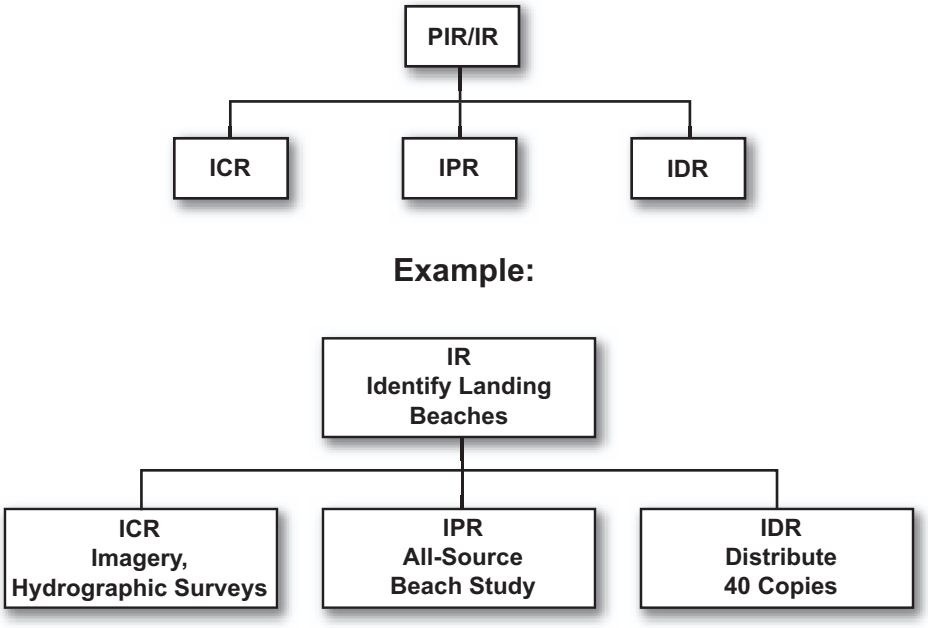

Figure 2-1. Requirements Satisfaction.

- Assessing collectability of the target versus available sensors and other collectors. This identifies the capability of the asset/resource to collect and suitability of the asset/resource to collect. Often what is marginally capable is not necessarily the most suitable to collect, but might be tasked if necessary.
- Conceptualizing multiplicity of collection: to ensure redundancy and as a hedge in case of single asset/resource or single collections discipline failure.

ICR Development Process

The ICR development process uses a building block approach of four steps that translates broad questions into concrete questions, tasks, and orders for collection agencies to perform. See figure 2-2.

Step 1, Identify, Validate, and Prioritize PIRs and IRs

This is the foundation of the ICR development process. It is the basis for collection planning and execution. A common mistake in regard to PIRs

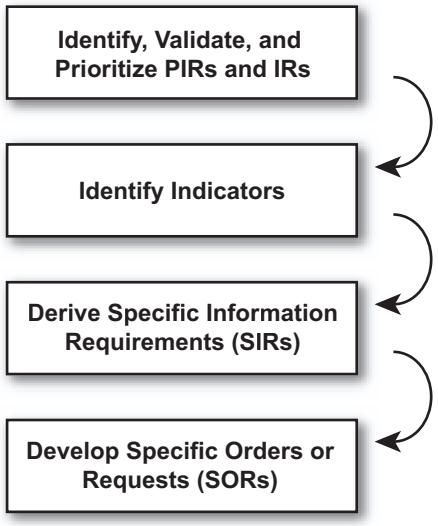

Figure 2-2. ICR Development Process.

and IRs in general is that they lack adequate specificity. Poorly developed PIRs increase the potential of failure regarding timely, pertinent collection, and follow-on intelligence operations. Focused, specific requirements are needed to make informed, effective plans and decisions. Below are examples of common PIRs, with an evaluation of each one's effectiveness.

PIR 1: "Where is the enemy going to attack?" This PIR is too broad, leaving too much open to interpretation in terms of critical considerations, such as specific—

- Threat unit.
- Threat equipment.
- Threat activity.
- Place and time.

PIR 2: "Will the enemy tank division attack our Obj A along Highway 66 prior to D-2?" This PIR provides enough specificity to enable effective collection of the required information and shows how to write a good IR.

Step 2, Identify Indicators

Once the critical IR question has been determined, the next step is to identify the activities that will confirm (or help deny if missing) the event specified in each PIR and IR. These activities, called indicators, are usually stated in general terms, such as "forward deployment of artillery." Indicators provide positive or negative evidence of threat activity or a characteristic of the environment that may influence the commander's selection of a particular course of action (COA). An indicator will often be associated with a named area of interest (NAI), which is a geographical area where activity is expected to occur that will confirm or deny an enemy COA. Guiding principles for indicator development follow:

- Collect on environment conditions or indicators. Developing an indicator related to a characteristic of the environment may be difficult because often there is no activity that describes a characteristic of the AO. It may be useful to evaluate these kinds of indicators in terms of a condition rather than an activity.
- Indicators must be focused and specific. Good requirements, whether PIRs or IRs, ask only one question, focusing on a specific fact, event or activity. The intelligence analyst uses indicators to correlate particular events or activities that occur—or fail to occur—to determine probable enemy COAs.
- Don't overlook the value of negative results. Negative information can be as important as positive information. Negative or disconfirming evidence can provide the intelligence analyst insight about the enemy's rejection of a COA. Negative information could lead to further investigation of a possible branch COA.

Step 3, Derive Specific Information Requirements

Each PIR/IR generates sets of associated specific information requirements (SIRs). SIRs are the observable or "collectible" bits of information that describe the information required to answer all or part of an ICR. A completed SIR describes the information required, the location where the required information can be collected, and the timeframe when it can be collected.

Drafting SIRs is an analytical, time-consuming process requiring a thorough understanding of the particular PIR or IR.

Marine Corps Intelligence Activity (MCIA) 1540-002-95, *Generic Intelligence Requirements Handbook (GIRH),* facilitates rapid, time-sensitive, crisis intelligence planning for MAGTFs. The GIRH is a compendium of frequently asked IRs, organized by mission profile, orders of battle, and terrain. The GIRH is used primarily as a checklist to rapidly organize planning and to determine gaps in information. It may be used as a sort of brevity code to efficiently request information. It may also be used as a baseline intelligence support tool for intelligence centers providing operational intelligence to forward

deployed forces. The GIRH is not a stand-alone substitute for SIR development. Collection managers should not "cut and paste" lists of requirements from the GIRH into their collection requirements list without going through the IR development criteria.

Having linked IRs to an indicator, that indicator must be broken down into very specific questions. This process consists of identifying the specific sets of information that will provide an answer—partial or complete—to each IR. Steps for developing SIRs include the following:

- Further narrow the focus of each indicator to identify "where to collect" (tying it to a specific point on the battlefield). We may use a specific NAI to replace the general idea of "forward" in the indicator, "forward deployment of artillery" and rewrite it as "artillery deployed in NAI 12."
- Refine the time to be observed. Starting from the LTIOV, collections personnel plan backward to determine collection times, taking into account time requirements to sort through collected data, report it, process it, analyze it, and further disseminate it to those needing it. If no LTIOV is specified, it must be requested from the originator of the requirement.
- Determine the specific observables. Next consider the "what to collect," building more detail by identifying the specific information that supports the indicator. For example, the specific information that supports the indicator, "artillery deployed in NAI 12," might include the presence of the following:
  - Artillery weapons.
  - Fire direction control equipment or vehicles.
  - Artillery-associated communications equipment.
  - Artillery ammunition carriers.
- Complete the SIR. A complete SIR describes the information required, the location where the required information can be collected, the time when it can be collected, reporting criteria, and principal and secondary recipients. Generally, each IR generates sets of SIRs.
- Refine the SIR. Develop each indicator further by identifying the specific types of equipment or other collectible/observable characteristic associated with each SIR. For example, replace—
  - "Artillery weapons" with specifics such as "120mm mortars" or "107mm multiple rocket launcher battery," if that is what should be present within the NAI and enemy force composition.
  - "Artillery-associated communications" with "the ABC data signal," if that is the type used by the enemy unit in question. This specificity will aid the collection or asset managers to optimize their collection capabilities against the target in question.

These SIRs have been properly developed. The collection manager has taken a focused PIR, matched indicators to it, i.e., activities that will confirm an event specified in the intelligence requirement, and developed SIR sets to support focused collection. A well-developed IR will contain all information needed to develop supporting SIRs. In this case, the IR often states the "where" and "when" to collect; the requirements manager needs only to refine the "what to collect" into specific items of information. A poorly developed SIR often results in requirements that do not contain the information needed to identify "where" and "when" to collect. Further coordination with the requester of information is then needed to obtain the "where and when." The following scenario is an example of identifying the previous steps of developing SIRs.

During wargaming, a regimental commander tells the S-2 "In order to commit our reserve I need to know if that tank regiment will turn east or west at Tonbak." The collection manager refines this into the PIR "Will the 3d Tank Division enter NAI 8 or NAI 9 on the evening of 5 May?" (triggers regimental reserve)

Note how the PIR is tied to a decision. The results of collection, i.e., the friendly responses, are stated as a *decision trigger.* The IR, as received and worded, is a good one for beginning focused requirements development. It already contains a reasonably detailed description of *what* the commander needs to know, *where* to find the intelligence, and *when* the event is expected to occur. However, the CRM needs to supply the COM and collection mission planners with more detail to support their planning and the subsequent development of SORs. Thus, the CRM concentrates on identifying good indicators to confirm or deny the information desired. One indicator is "movement south of the enemy's 3d Tank Division." The collection manager then develops the following sets of SIRs designed to support the *same* PIR:

- **"Will more than 220 combat vehicles of the 3d Tank Division pass through NAI 8 or NAI 9 between 051400 and 060400 March?"**
- **"Will more than 17 reconnaissance vehicles subordinate to the 3d Tank Division or its regiments pass through NAI 8 or NAI 9 between 041800 and 052000 March?"**
- **"Will more than 38 artillery weapons subordinate to the 3d Tank Division enter NAI 8 or NAI 9 between 015200 and 060200 March?"**
- **"Are more than 2 R-XYZ radios active in NAI 8 or NAI 9 before 060200 March?"**

Step 4, Develop SORs

Each indicator generates a number (sets) of SIRs. Each SIR will, in turn, generate a SOR that can be used to task collection assets or request collection resource support from external assets in the COM process. A well-written SIR is easily translated into an effective SOR by making a directive vice inquisitive statement. In other words, if a SIR is a question, the SOR directs a collection asset or resource to find an answer.

A SOR is the order or request that generates planning and execution of a collection mission or analysis of database information and intelligence. SORs sent to subordinate commands, to include collection assets, are orders. SORs sent to other commands, usually collection resources, are requests. After SORs have been developed, the collection manager is ready to develop the collection plan. The collection plan will reflect the SORs assigned to selected collectors for each IR.

Avoid overly restrictive reporting criteria and guidelines. Allowing collectors appropriate latitude will enable them to provide not only the requested information, but possibly other valuable information not specifically requested. A sample SIR follows.

SIR: "Will more than 17 reconnaissance vehicles subordinate to the 3d Tank Division or its regiments pass through NAI 8 or NAI 9 between 041800 and 052000 May? LTIOV: 052000 May."

SOR 1A: "Report the presence of reconnaissance vehicles in NAI 8 or NAI 9 between 041800 and 052000 May. Specify direction of movement and numbers and types of vehicles. LTIOV: 052000 May."

SOR 1B: "Report the presence of communications nodes associated with reconnaissance elements of the 3d Tank Division or its subordinate regiments in NAI 8 or NAI 9 between 041800 and 52000 May. LTIOV: 052000 May."

Collection Assets/Resource Selection Factors

After defining ICRs and supporting SIRs/SORs, the collection manager must determine the availability and capability of collection assets and resources that may contribute to ICR satisfaction. The collection manager compares the characteristics of the target with the specific aspects of the requirement and the characteristics of available assets or resources to determine the collectors to select. This step involves a cooperative and coordinated effort for both the CRM and COM processes.

The four basic factors that influence selection are capability, suitability (or feasibility), redundancy/multiplicity, and balance. Other factors to consider are target key elements, collection capabilities, correlation, and the environment.

Capability

Is the asset/resource physically and technically capable of collecting the required information on the particular target of interest within the limitations imposed by the requirement? To decide if an asset or resource can collect the data, the collection manager considers a range of operational and technical factors that include key element sets of the target, geography, weather conditions, and threat activity. These factors are then correlated or compared to asset and/or resource availability and capability factors; e.g., platform and sensor range, preparation and system timeliness or characteristics of sensor.

Suitability (or Feasibility)

Is the asset/resource actually suitable to perform the mission, whether alone or in combination with other collectors? The collection manager determines if the different collection/intelligence disciplines have a high confidence level of successfully executing assigned missions given their unique capabilities and limitations. These capabilities and limitations are generally focused on technical or performance characteristics, range, dwell time, and timeliness.

Redundancy/Multiplicity

Should another collector be tasked to collect against the same requirement to provide redundancy or to pose a detection dilemma for the enemy? In some cases a collection asset or resource may not be able to fully satisfy a requirement. To achieve a greater degree of satisfaction, the collection manager employs redundancy of tasking to other collectors. Redundancy employs a collection strategy that involves the use of several same-discipline assets to cover the same target. Redundancy is used on high priority targets when the probability of any one system adequately collecting is low. The collection manager also mixes different sensors in different intelligence disciplines to achieve combined arms effects on an enemy target.

Balance

Are any collection assets/resources overtasked and others underutilized? Proper balance ensures the efficient tasking and employment of all organic and supporting intelligence and reconnaissance assets without overburdening/overcommiting any or underusing others.

Target Key Elements

Key element sets are the parameters of the target's characteristics that can be compared with characteristics of the available collection assets and/or resources to serve as discriminators in discipline or sensor selection. The key elements commonly considered are target characteristics, range to the target, and timeliness.

Target characteristics are the discernible physical, operational, and technical features of a unit, object, event or other intelligence target. These characteristics may be observable and collectible. Observables are the unique descriptive features associated with the visible description (or

signature) of the target, whether it is specific units, equipment or facilities. Collectibles are unique descriptive features associated with emanations from the target. Observables are associated with emanations via IMINT, HUMINT, CI and ground/air reconnaissance; collectibles with SIGINT and CI; both associated with measurement and SIGINT.

Range is measured as distance from a predetermined reference point to the target location. The range to the target can be used to quickly eliminate from consideration those standoff sensors that cannot cover the target area and those sensors on penetration platforms that cannot reach the target area.

Timeliness refers to a comparison of the demonstrated system timeliness of a collection asset or system with the time the ICR must be satisfied by the published LTIOV.

Collection Capabilities

The collection manager translates the capabilities and limitations of available collectors into a set of collection capability factors that can be directly compared to the key target element sets. The capabilities and limitations of the various collectors are considered, together with their availability, to determine if they should be tasked. Sensor capability factors are technical or performance characteristics, range, dwell time, and timeliness.

Performance characteristics are concerned with the system's ability to collect the needed information, output quality, and geolocational accuracy. A collector within a particular discipline may or may not be able to collect information on a particular target. The data quality relates to the level of detail derived from the collected information; e.g., different imagery systems provide varying degrees of imagery resolution. The importance of geolocational accuracy depends on the planned use of the information collected; e.g., targeting demands greater locational accuracy than information collected for threat unit identification and order of battle updates.

Range deals with the collector's ability to provide target coverage. For airborne systems, range is determined by considering the actual range capabilities of the aircraft and its collection system to provide detailed information sufficient to satisfy the requirement and any operational or fire support restrictions placed on it. The CRM process assesses combinations of these range factors to determine the collector's potential to meet the tactical ICR.

Dwell time is the length of time a given collector can maintain access to the target, an important consideration during collection monitoring, particularly during high tempo operations.

Timeliness considers the time required to complete each collection event and is calculated or estimated for each available sensor based on the tactical situation. Times vary depending on mission priority assigned, specific system availability, time required to plan the mission, and related information processing and dissemination means. These times are added to find an overall elapsed time, then compared with the latest timeliness information stated by the requirement originator.

Correlation

Correlation is the process that associates and combines independent data on a single subject to improve collection reliability or credibility. Key target element sets are compared with collection capability factors to provide a preliminary list of units and sensors that are technically able to collect the desired data within range to the target and time required.

Environment

After correlation, candidate sensors are compared with environmental factors to support final sensor selection. Environmental factors include collector vulnerability to the threat, weather and light conditions, and terrain that might influence the collector's ability to acquire the necessary information. Depending on the environment, a technically capable sensor may be dropped from consideration.

Sensor vulnerability is the degree to which adversary fires countermeasures (deception, camouflage, and operations security) will affect sensor selection and depends on the vulnerability of the sensor platform. In general, the platforms of penetrating sensors are the most vulnerable, stand-off sensors less so, and satellite sensors the least vulnerable. Threat assessment is an evaluation of risk versus potential intelligence gain.

Weather and light conditions are considerations, particularly with imagery and visual collection sensors. Weather conditions in and around the target area affect the sensor capability to collect and exploit data.

Terrain is also a consideration. It may mask a target, thereby dictating the direction a sensor must point or locate, which will influence ingress/egress route planning for penetration sensors, flight paths, loiter tracks for standoff sensors and/or satellites, SIGINT collection/direction finding site selection or additional radio communications relay needs.

Intelligence Collection Planning

Compilation of ICRs and SIRs is the basis of the collection plan. Collection planning is defined as a continuous process that coordinates and integrates the efforts of all collection assets and resources. The CRM cycle begins with initial efforts to answer the IRs, particularly the commander's PIRs, established during the planning and direction phase of the intelligence cycle. Based on these requirements, intelligence analysts prepare RFIs. In the context of collection management, RFIs are queries to see if the information and intelligence already exists. If not, they form the basis for the ICRs and IPRs. When the RFI manager positively determines that the information is neither available nor extractable from archived information or from other intelligence sources, an intelligence gap is identified. It then becomes the responsibility of the collection manager to obtain the information.

The collection plan includes the supported IRs, SIRs, when the information is needed, reporting criteria, who is to receive the finished intelligence, and how it is to be used. The information collected to satisfy these ICRs will answer the IR or be used in intelligence analysis and production. The collection plan forms the basis for further collection actions. The collection plan is integrated and coordinated, selecting the best collectors to satisfy each requirement. It will be a text, graphic or combined representation of the collection strategy. The collection plan may be a simple hardcopy or automated worksheet used solely by the intelligence section, or a more formal, comprehensive document, depending on the complexity of the requirements to be satisfied. Regardless of whether automated or manual tools are used, the basic content of the collection plan includes the following:

- IRs.
- Indicators.
- SIRs.
- Collection assets and resources to be employed.
- Reporting criteria and instructions.
- Remarks.

IRs Worksheet

The IRs worksheet is a useful tool for tracking the status of IRs. The format is established by unit procedures or may be established within the OPLAN/OPORD. See figure 2-3 on page 2-12 and appendix A for a detailed description.

MEF IR Number	Requester Number	DTG Received	Subject	Action	Status
04-1012	1st Marine Division Number 04-001	090830 Jan	Recon Activity in NAI 32	SOR Numbers 04-1462 (UAV) 04-1463 (GSP) 04-1464 (Force Reconnaissance)	Closed 091630 Jan
04-1014	MEF G-2/P&A Cell	101100 Jan	Imagery of landing beaches	Forwarded to JTF J-2 or national collection	Pending

Figure 2-3. Sample Intelligence Requirements Worksheet.

Intelligence Collection Worksheet

The intelligence collection worksheet is a useful tool for linking IRs to collection assets. The format is established by unit procedures or may be established within the OPLAN/OPORD. See appendix B for a sample intelligence collection worksheet.

Reporting

Specific reporting criteria instructions are included. Normally, the place where information is reported is the unit that submitted the requirement.

Collection and Related Planning Tools

Although the collection management process has been formalized for quite some time, it remains dynamic and continually evolving. Technological advances have increased the timeliness of collections planning, direction, and execution. Many collection planning tools have emerged that provide significant improvements to the process. The most important of these follow:

- Standard collection plan format. The collection plan establishes guidance for intelligence collection activities and tasks collection assets. See appendix C for a sample intelligence collection plan. It contains specific orders for subordinate elements to collect and report information.
- Collection tasking worksheet. This management tool assists the collection manager in identifying a specific collector, system or discipline best suited to collect against a particular information requirement. See figure 2-4.

COLLECTION TASKING WORKSHEET

OSINT								

Assets/Resource Selected: **HUMINT:** **COMINT:** **MASINT:** **CI:**

IMINT: **ELINT:** **OSINT:**

Figure 2-4. Intelligence Collection Tasking Worksheet.

- IPB collection techniques. When properly conducted, the results of IPB are an exceptional aid in identifying critical gaps of information and focusing collection requirements. The event template and event matrix together describe the indicators and activity expected to occur in NAIs, targeted areas of interest, and decision points. Using the decision support template and a graphical or written record of COA wargaming, the collection manager can determine where collection is required, what is to be collected, and when the information is required.
- Collection status update paragraph. The use of collection status update paragraphs as part of an intelligence summary is an effective technique to ensure all within the MAGTF are aware of planned collection missions. In it the collection manager provides a summary of the unit's collection priorities and planned operations for a specified period. The collection status paragraph can update a unit's active and cancelled requirements, and is a good way to inform subordinate, adjacent, and higher headquarters units of the a MAGTF's planned collection requirements and operations. Appendix D provides an example of a collection status update paragraph to a MEF intelligence summary. Items that may be included are intelligence collection priorities, cancelled requirements, and planned intelligence collection missions.

Intelligence and Reconnaissance Assets Tasking

The tasking mechanism for MAGTF intelligence and reconnaissance assets is situation-dependent and shaped by a number of variables. The collection manager issues orders to those assets that are in DS or attached to his unit. Certain external collection resources are tasked only through structured and rigorously enforced standards for collection requests; e.g., national IMINT and SIGINT systems. The intent of these collections tasking guidelines is to standardize the process to improve the quality and timeliness of collection operations.

Standard Formats for Asset Tasking

Tasking request formats or messages depend on the tactical situation, type of sensor, and type of asset or resource; i.e., organic, supporting, theater, national or multinational. Many specific data elements in these requests and the transmission procedures are classified. In the case of MAGTF organic and DS, requesters follow combatant command instructions provided in the unit standing operating procedures (SOPs), theater procedures, and OPLAN/OPORD intelligence annexes. The Joint Tactical Exploitation of National Systems manual and the 58-series of the Defense Intelligence Agency Manuals (DIAMs) provide guidance for requesting collection support from national resources.

Guidelines for Requesting National/ Theater Collection Support

Formats to request national and theater collection are in various DIAMs (58-series), Joint Tactical Exploitation of National Systems manual, and combatant and theater command TTP. Regardless of the formats used or the mechanisms for tasking those national/theater resources, CRM should be guided by the following principles:

- Areas of interest. National systems are best employed against high-priority targets outside the range of organic or theater sensors, beyond standoff collection range, and/or in high areas.
- Exploitation and/or analysis timeliness. Targets must be chosen such that, under applicable timeliness constraints, exploitation reports will reach the commander in time to react or influence decisionmaking.

- Justifications. Request justifications must fully explain the need for information and support the priority assigned by the requester.
- Sensor capabilities. Target descriptions must place minimum restrictions on the employment of collection systems.
- Sensor accessibility. The targets' accessibility must be determined when possible before a collection request is forwarded.
- Exploitation and/or analysis requirements clarity (concise, explicit statements of actual information needed).
- Exploitation and/or analysis requirement purpose (state the purpose of the information desired when it will benefit the interpreter and/or analyst).
- Preplanned collection. Preplanned target sets submitted in advance of an operation can relieve the workload and must be considered where the tactical situation permits.

Production Requests

Once the unit intelligence officer determines that the requirement cannot be met with local resources, the requirement is forwarded up the chain of command for satisfaction. The intelligence officer determines whether to submit the requirement as RFI, ICR, IPR or production request (PR).

Generally, an RFI is submitted if the requirement is a fairly straightforward question. In a noncombatant evacuation operation, an RFI may be, "How many personnel require evacuation?" In this case, no extensive collection or production is required because the intelligence is generally available.

A PR is more appropriate when the IR is complex or substantial; e.g., "What is the capability of country X to defend its coastline against an amphibious assault?" This requirement may result in an IPR for the MEF CE or a PR to the JTF headquarters because the answer will require the collection and analysis of a large amount of information ranging from hydrographic conditions to available threat weapon systems. Such analysis may be beyond the capabilities of a small unit intelligence section and more appropriately performed at the theater or Service level where access to information and ability to task collection resources are greater.

A PR is also appropriate to satisfy a requirement that may be recurring in nature or in a denied area; e.g., "How many aircraft are maintained on alert status at airfield Y?" If organic assets are not available, the unit intelligence officer will submit a request for theater and national production assets to monitor the airfield to determine the answer. As an RFI travels up the chain of command, it is satisfied (from available information or intelligence or by collecting new data), converted into a PR or forwarded to the next higher level for satisfaction. Each unit in the chain of command validates the PR and satisfies it from within or passes the requirement to the next higher authority for action.

Most IPRs are levied on the intelligence battalion, P&A company's P&A cell, which is the MAGTF's principal deliberate production asset. Based on the commander's guidance and the G-2/S-2's direction, the intelligence battalion commander or ISC does the following:

- Plans, manages, and conducts MAGTF IPR management.
- Exercises staff cognizance over MEF collection and production elements to fulfill PRs.
- Determines PRs that are produced locally and PRs that are forwarded to the appropriate theater, Service or national Department of Defense Intelligence Production Program (DODIPP) production center validation officer (VO).

The VO reviews the PR, determines if to accept and satisfy it, forward to another production center or invalidate the PR. The combatant commander, the joint force commander or the MAGTF commander directs PR and RFI procedures, which vary from theater to theater; e.g., a

MAGTF preparing to deploy submits PRs through the normal Service chain of command to the MCIA VO. However, a MAGTF operationally assigned to a combatant commander submits PRs through the established operational chain of command to the VO supporting that theater. A theater intelligence directorate (J-2) may delegate validation authority to a JTF J-2 during a crisis, providing the JTF J-2 a streamlined path for joint intelligence center production support and priority over other noncrisis production requirements. For most crises and contingencies, annex B to the joint force commander's OPLAN/OPORD specifies policies and procedures for requesting intelligence production support.

Production Request Format

The same basic format is generally used for RFIs and PRs. This facilitates conversion of an RFI into a PR at a later time. A basic level PR must include the following:

- Organizations and specific offices or individuals requesting the product.
- A statement describing the required information and intelligence and sources consulted by the requester and source shortcomings relative to the request.
- LTIOV.
- Product form; e.g., hardcopy text, electronic file on disk, and total quantity of each.
- Requirements prioritization for multiple elements.

The basic format is sufficient at lower tactical levels. At higher levels the format becomes more structured. Defense Intelligence Management Document 0000-151C-95, *Department of Defense Intelligence Production Program (DODIPP): Production Procedures*, stipulates the format for PRs, which ultimately will be forwarded to a DODIPP VO and production center. Each combatant command defines formats and procedures in their applicable intelligence procedure documents. The MEF CE and MSC headquarters SOP define formats for their headquarters and subordinate elements. See also MCWP 2-12, *MAGTF Intelligence Production and Analysis*.

CHAPTER 3
INTELLIGENCE COLLECTION OPERATIONS MANAGEMENT

Collection operations management is the authoritative direction, scheduling, and control of specific collection operations and associated processing, exploitation, and reporting resources. (JP 1-02)

The COM process organizes, directs, and monitors the units, equipment, and personnel that actually collect the data to satisfy the ICRs. Strategies and plans are developed for collection to accomplish the following:

- Estimate how well a collection asset or resource can satisfy requirements.
- Evaluate the performance of collection assets and resources.
- Allocate and task assets or request resources.
- Monitor and report the results and status of collection efforts, organizations, and systems.

Actions taken by units explicitly to satisfy IRs are collection operations. Considerations are similar to any other kind of operation. Intelligence COM is concerned with the mission management (how to employ collection resources) and asset management (execution of collection missions) functions of the collection cycle and includes the following:

- Mission planning and collection plan development.
- Collection asset tasking.
- Exploitation and reporting.
- Supervision of the collection effort.
- Updating the collection plan during execution.

Mission Planning and Collection Plan Development

Mission planning is based on the requirements generated by the CRM process. It plans and executes operations to satisfy those requirements. It supports the entire intelligence cycle, focusing on the processing and exploitation, production, and dissemination steps of the intelligence cycle and the collection process. As an integral step in the CRM/COM process, the collection manager must be informed of the requirement originator's guidance for production and dissemination. Any specific constraints or restraints should be identified during the CRM process and factored into COM mission planning.

COM mission planning is concerned with identifying, scheduling, and controlling collection assets and/or resources. The COM planner reviews the mission requirements for system responsiveness, weather, threat data, and intelligence reporting requirements. These elements are considered with the detailed technical, CIS, administrative, and logistical data of each tasked asset or collection system to determine asset availability and capability. Requirements are then translated into specific mission tasking orders.

CRM and COM processes use similar intelligence collection planning and management tools including the following:

- Intelligence collection worksheet.
- Intelligence collection plan.
- Collection reports.
- Collection status update paragraph.
- Collection emphasis message.

In simple terms, COM allocates and tasks assets and resources and monitors and reports the status of collection operations.

Collection Asset Tasking

Key considerations that affect the planning and scheduling of intelligence collection operations follow:

- Clear communication of mission, intent, concept of operations, and tasks to those units that must execute them.
- Ensuring suitability of intelligence collection resources to accomplish missions and achieve objectives, to include that of the unit and all subordinate and supported commands.
- Ensuring sustainability of intelligence collection operations to support current and anticipated future operations.
- Monitoring progress of intelligence collection operations and adjusting plans to achieve collection objectives.

While much of the responsibility for most of overall planning and direction effort rests with the G-2/S-2's intelligence operations officer, the collection manager must maintain concurrent awareness of these factors and their impact on collection planning and operations.

After a thorough study of availability, capability, and performance history, the collection manager selects the resource most capable to satisfy the requirement. Various approaches to collection exist. They center around three strategies or a combination of them:

- Tasking organic or supporting intelligence and reconnaissance resources.
- Requesting intelligence and reconnaissance collection support from external MAGTF forces.
- Recommending other collection tasking to subordinate elements.

Tasking Organic Collections and Production Assets or Supporting Collection and Production Resources

Although the strategy adopted by the collection manager will always vary based on the mission and the IRs to be satisfied, tasking organic assets should be considered first. The advantage to this is that the collection manager has the most control over these assets and they are generally more responsive. The collection manager usually understands their capabilities, limitations, and performance history well. Generally, reconnaissance assets should not be held in reserve. A possible exception to the policy of employing all reconnaissance assets without a reserve is when the collection manager is aware of a future requirement that will need to be addressed.

Requesting Support from External MAGTF Collection and Production Resources

The IRs generated in the planning cycle often mandate employment of external resources. When selected, requests for support from higher headquarters, e.g., JTF, theater or national assets, should be prepared and submitted up the chain of command. Although external collection resources may be more capable than some organic assets, the collection manager runs the risk that those external assets may already be tasked to other competing IRs and his needs will go unmet. Various tasking documents levy IRs on collection resources. Some tasking mechanisms are theater- or intelligence systems-unique. The Joint Tactical Exploitation of National Systems and various DIAMs specify procedures and formats for requesting support from national systems or agencies. Combatant commands will also modify, clarify or add to these procedures in their local intelligence SOPs or TTP.

Tasking Subordinate Elements

Recommending collection tasking to subordinate elements can be a lucrative source for satisfying IRs. Even Marines not assigned to an intelligence collection unit can provide valuable information, especially when in contact.

Often times at units below the MEF CE level-particularly at the battalion or squadron level-these taskings take the form of reconnaissance and surveillance (R&S) plans.

A mission tasking order goes to the unit selected to accomplish a particular collection mission. The selected unit makes the final determination of specific platforms, schedules, equipment, and personnel to be employed.

MAGTF Collection Tasking

There are many ways to task collection assets. The primary means to task MAGTF collection assets include the following:

- OPLAN/OPORD Intelligence Annex. Annex B, Intelligence, of the OPLAN/OPORD is the most commonly used vehicle for initial collection taskings. Appendix 10, Intelligence Operation Plan, contains the intelligence collection plan (appendix 10, Tab A).
- OPORD/FRAGO Execution Paragraph. Another tool for disseminating collection taskings is to include those taskings in paragraph 3 of the unit's warning, fragmentary or OPORD or in a standalone collection unit FRAGO. Detailed coordination must be conducted with the G-3/S-3 for this technique to succeed. Amplifying or supporting details can be included in annex B or its appendices as required.
- RFI. RFIs are any specific, time-sensitive IRs to support ongoing operations. It is not necessarily related to standing collection requirements or scheduled intelligence production. An RFI is initiated to respond to tactical requirements (critical information gaps and is validated in accordance with the unit's SOPs); e.g., a regimental S-2 may submit a time-sensitive RFI requesting confirmation of the size and composition of an enemy formation (no further information) reported by one of its battalions at a specific location. This would then be researched by higher headquarters G-2 staff and answered immediately if the information or intelligence exists. If the information or intelligence does not exist, the RFI would form the basis for an ICR that may result in a request for UAV support.
- Collection Emphasis Message. A collection emphasis message is another tool to broadly disseminate the MAGTF's collection focus. It is disseminated to higher, lower, and adjacent units; intelligence collectors; and intelligence exploitation and processing centers. It details the unit's PIR's and associated SIRs and SORs. The primary benefit of communicating collection intent is the operational perspective it provides organizations that may otherwise be isolated from the planning process. An informed collector can often amplify reporting to provide an answer that goes beyond immediate questions. See appendix E for a sample message.
- Statement of Intelligence Interest. A statement of intelligence interest (SII) is a comprehensive listing of a unit's IRs for a specified time period. The SII usually addresses long periods of time (2 to 3 years) and identifies broad areas of interest rather than specific information requirements addressed by SORs. All commands larger than battalions/squadrons should submit an SII and update it periodically. These SIIs are used to develop dissemination requirements for the DODIPP. The dissemination scheme may result in hardcopy or softcopy dissemination to units.

Exploitation and Reporting

Exploitation of collected information and reporting is closely associated with the management of collection assets and resources. Generally, the staff allocated a collection capability also controls the

supporting processing, exploitation, analysis, and production response. The collection manager shares a responsibility for evaluating the collected information. The consumer—the supported commander or his users of intelligence—ultimately determines how well the IRs have been satisfied.

Techniques that assist in effective exploitations include cueing, redundancy, mix, integration, and coordination.

Cueing

Cueing uses one or more intelligence or reconnaissance asset to provide data directing collection by other intelligence or reconnaissance elements. Cueing maximizes the efficient use of finite collection assets in support of multiple, often competing, intelligence collection priorities.

Collection managers should plan to create opportunities for cued collection as part of the collection strategy; e.g., a HUMINT source may be employed 24 hours before a UAV mission to confirm or deny activity along a key corridor. If the HUMINT source reports the absence of activity, the UAV mission can be redirected to another area or used to confirm the absence of activity, depending on the relative priority of IRs. If the HUMINT source reports significant activity earlier than anticipated, the UAV mission may be accelerated to collect supporting detail, or instead retasked to another mission.

Cueing may occur dynamically (outside the collection strategy) as one intelligence or reconnaissance collector tips off another collector to a collection opportunity. Intelligence collection systems can drive operational tasking. This is most common when collection on a particular NAI triggers a decision corresponding to a decision point or fires at a target area of interest. Examples follow:

- An aviation ground attack mission is "tipped off" to specific threat air defense activity and flies a different ingress-egress profile.
- Indirect artillery fires are "cued" to more precise target areas.
- Ground maneuver elements are "tipped off" to changes in an expected enemy COA.

These examples illustrate the need for coordinating intelligence with other operations and demand the collection manager's active participation in the wargaming process when requirements are initially developed, and for close coordination with current operational intelligence, operations, and fires elements.

Redundancy

Redundancy planning is part of a collection strategy using several same-discipline assets to cover the same target. Redundancy is often used on high priority targets when the probability of any one intelligence or reconnaissance element adequately collecting is low. The probability of detection increases as a function of the number of collectors; e.g., if several SIGINT collectors focus on a designated emitter at different times, the probability of intercept improves, even if the emitter operates intermittently. The chance of acquiring accurate geolocational information using direction finding equipment is also improved through redundant collection tasking.

Mix

Mix means planning for complementary coverage by a combination of assets from multiple disciplines. Intelligence and reconnaissance mix techniques increase the probability of collection, reduce the risk of successful enemy deception, can facilitate cueing, and provide more complete intelligence reporting. The best mix of collectors puts the enemy in a dilemma. No matter what the enemy does (stays still or moves out), he is detected, identified, and possibly located; e.g., reconnaissance reports resupply activity within a known assembly area; SIGINT intercept of the associated logistics net provides unit identity, subordination, and indications of future activity.

Integration

Integration is the resource management aspect of collection strategy development. It involves integrating new requirements into planned or ongoing missions. Barring a decision to use redundant coverage for a critical target, collection managers must integrate new missions with previous planned or ongoing missions. Integration helps to avoid undertasking capable collectors. Resource integration examples are:

- Adding ICRs to a light armored reconnaissance battalion performing a zone reconnaissance mission.
- Inserting a new ICR during a preplanned UAV mission or replacing an existing requirement with one of higher priority.

Coordination

The collection manager must ensure the plan is coordinated. The collection manager develops SIR sets from the consolidated, validated, and prioritized list of PIRs and IRs. SIRs complete the collection strategy by associating each requirement with the corresponding decisions and time lines. Starting at the point that the commander requires intelligence to support a decision, the collection manager backward plans the collection mission to account for mission preparation, collection, reporting, processing, analysis, production, and dissemination.

One tool to coordinate the collection strategy with the planned friendly and estimated enemy operations is the intelligence synchronization matrix. In addition to the LTIOV determined by the prioritized IRs and associated decision and reporting criteria, the matrix records NAIs from the event template and reflects timelines of expected enemy activity from the IPB event template and the event matrix. The intelligence synchronization matrix provides the basic structure for the more detailed collection plan. See figure 3-1.

Report Formats

Standardized report formats support common understanding, interoperability, and efficient dissemination of collection results and other intelligence products. Standardized formats simplify and speed along the accurate, timely flow of reports from information collectors to intelligence analysts and allow their rapid incorporation via information systems into databases. Some of the more common reports used in collection reporting follow.

SIGINT

Most SIGINT reports are formatted and classified. Common reports include:

- SIGINT spot.
- SIGINT summary.
- Tactical.
- Tactical electronic intelligence.
- Critical intelligence.

These reports disseminate time-sensitive SIGINT information from collectors to requesters or intelligence consumers. However, information may also be disseminated using noncodeword reports. Unlike standard SIGINT product reports, noncodeword reports may be passed directly to commanders to allow immediate tactical use. Specific procedures for noncodeword reporting during operations should be in the SIGINT appendix to annex B of the OPORD. See MCWP 2-15.2.

Ground Reconnaissance

Reconnaissance teams report to their higher echelon of command. These reports are received in the SARC. The SARC also establishes priority reporting criteria for each committed team based on that team's information requirements. Normally, teams do not maintain constant radio communication while moving and sometimes while in observation posts, but they do monitor and transmit messages during the established windows.

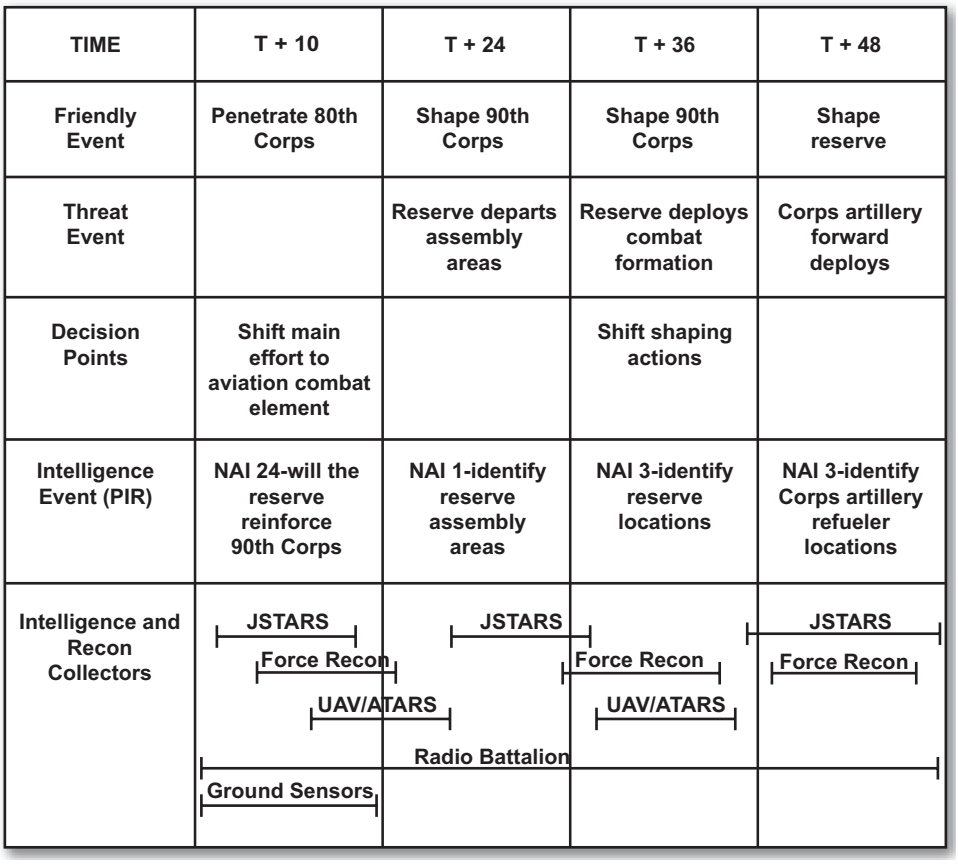

Figure 3-1. Notional Intelligence Synchronization Matrix.

The SARC, however, establishes around-the-clock radio watches over primary and alternate nets so that teams can communicate immediately if necessary. Reporting windows may be established for the transmission of routine traffic or routine reports, such as situation reports. Other primary reconnaissance reports include:

- Size.
- Activity.
- Location.
- Unit.
- Time.
- Equipment.
- Hydrographic.
- Beach survey.
- Confirmatory beach.
- Surf.
- Landing zone.
- Road and route.
- Bridge.
- River/estuary.

See also MCRP 2-15.3B, *Reconnaissance Reports Guide*.

Measurement and SIGINT

Sensor information is like any intelligence information. It is analyzed and combined with other intelligence information to build a complete picture of the AO and the threat. The sensor report is the standard format used to report sensor data. This format is used for voice, data, and hardcopy reports. The general state of the sensor network, changes in the status of specific strings and

relays, and planned sensor operations can be reported using the sensor status report. See MCWP 2-15.1.

Interrogator/Translator Operations

Results of interrogation of enemy prisoners of war and detainees provide a valuable source of intelligence information. The tactical interrogation report may provide a written summary of initial or subsequent interrogations. The document translation report may disseminate information resulting from captured enemy document exploitation. The intelligence information report format may also disseminate information derived from interrogation or translation. A HUMINT appendix may be included within Annex B, Intelligence, of the OPLAN/OPORD to establish standardized reporting procedures.

CI

CI assists in accomplishing three major objectives:

- Screening out refugees whose very presence threatens overall security of the force.
- Detecting enemy agents' intent on espionage, sabotage, terrorist or subversive missions against the force.
- Collecting information of value to other intelligence and security agencies.

The principal reports are the CI spot report, CI information report, and CI interrogation report. The CI spot report is a quick response report to get information into the all-source correlated database. The CI information report is a standard report used to report tactical CI information. The interrogation report is used to report interrogation information. MCWP 2-14 contains formats and specific instructions for completing these reports.

IMINT

IMINT mission results are reported in various reports. The specific type of report used is driven by the requirement originator's timeliness/currency concerns; i.e., LTIOV, and the type of mission being reported. All imagery reports are submitted via data or hardcopy format from the processing or exploitation center to the supported unit. IMINT reports are disseminated to adjacent and higher units. The reconnaissance exploitation report expeditiously reports results of an aerial imagery mission. Results should be disseminated within 1 hour of receipt of the imagery at the processing facility and focus exclusively on immediate information requirements. The initial photo interpretation report provides information on imagery collection missions not previously reported and can follow up any issued reconnaissance exploitation report with amplifying details. The supplemental photo interpretation report provides information not previously included in a reconnaissance exploitation report or initial photo interpretation report. See DIAM 57-05, *DOD Exploitation of Multi-Sensor Imagery*, and MCWP 2-15.4.

Miscellaneous Reports

- Response to RFI.
- Patrol.
- Mission.
- Ground reconnaissance or aircrew debriefing.
- Spot.
- Bombing, shelling, and mortaring location report.

The response to RFI report is generally submitted via data or hardcopy formats. The ground reconnaissance and aircrew debriefs are usually submitted via voice, however, aircrew debriefs are often submitted via message as mission

reports. The bombing, shelling, and mortaring location report contains observance of enemy indirect fire weapons. This report is submitted via voice communications.

Supervision of the Collection Effort

Direction of the collection effort does not end with issuing SORs. The collection effort is continually supervised by the collection manager and coordinated with the C2 elements of the collection asset or resources. The focus is to ensure that collection agencies have received SORs and that they are clearly understood. Coordination is conducted with processing and exploitation centers and among MAGTF collection operations officers and those of higher, adjacent, and subordinate units.

Functions

Monitoring

Monitoring of ongoing collection operations is conducted to ensure that PIRs and other IRs are being satisfied and that they are done so in a timely manner. Intelligence reports received are reconciled with the requested LTIOV of requirements to assess the timeliness and responsiveness of the collection operations. Monitoring is conducted by the requester, the collection manager, and the production and exploitation centers.

Evaluating

The evaluation process tracks the status of collection requirements and provides feedback to the requesters. When collection results are provided, the collection manager evaluates the reports for the following:

- Completeness.
- Clarity.
- Adherence to specified reporting criteria.
- Responsiveness to users' intelligence and timeliness satisfaction.
- Identification of opportunities to cue other intelligence and reconnaissance collection resources.

Requester feedback establishes customer satisfaction, permits tasker deletion, and frees collection assets and resources to be redirected to satisfy other active requirements.

Updating

Based on the requester's assessment of requirement satisfaction, the collection manager reviews priorities for currency. The collection plan is updated to include retasking (if the requirement is not satisfied), adding new requirements based on the impact of changes in planned friendly operations, changes in known or assessed enemy operations or canceling satisfied requirements. It is imperative that the collection plan be continually updated and those changes communicated to higher, lower, and adjacent units to maximize collection operations efficiencies.

Duties

Collection Manager

The collection manager should prioritize IRs, convert them into collection requirements, and coordinate actions with appropriate collections agencies. The collection manager must continually seek to maximize the effectiveness of limited collection resources within operational time constraints.

P&A Cell OIC

Primary responsibility is to manage and supervise the MAGTFs all-source intelligence processing and production efforts.

SARC OIC

As one of the focal points for intelligence reporting from organic assets, the SARC OIC must screen the intelligence reporting and interface with intelligence analysts to see if reporting is satisfying stated requirements.

Subordinate Unit Intelligence Officers

Supervisory responsibilities at the tactical level include ensuring that IRs are correctly prioritized and submitted and that feedback in the form of an evaluation is provided to the collection manager and/or collectors. This two-way communication enables requestors to clarify issues that may not be understood by collectors.

Updating the Collection Plan During Execution

As information is reported from collectors and new IRs are generated throughout the MAGTF, IRs and the collection plan require updating. If the data is insufficient, additional collection may be coordinated with the collection manager. At this point, the processed requirement transitions out of the COM cycle. The collection manager and the P&A cell OIC, in coordination with the SARC OIC and requesters, continually assess the effectiveness of collection operations and how quality and timeliness may be improved. As the collection plan is updated, all subordinate commanders and their intelligence officers must be informed so they may be apprised of ongoing MAGTF intelligence collection operations. Direct communication with those directly affected is critical. Broad dissemination of intelligence collection plan updates may be accomplished by web-based or other automated means.

CHAPTER 4
PLANNING AND EXECUTION

The intelligence collection effort must support and adapt to the MAGTF commander's intent, concepts of intelligence and operations, and the supporting scheme of maneuver. Key questions for operational integration include the following:

- What is the MAGTF AO and the area of interest?
- What is the MAGTF concept of operations, task organization, and main and supporting efforts?
- What are the standing PIRs and IRs? Which have been tasked to supporting units? What specific information is the commander most interested in; i.e., enemy ground operations, enemy air operations, target BDA, friendly force protection or enemy future intentions?
- What is the concept of MAGTF fires support? How will MAGTF target development and target intelligence be conducted? What are the specific collection needs to support these?
- What are the concepts of intelligence and operations of other JTF, component, and theater resources? What are the task organization and command/support relationships for all MAGTF intelligence and reconnaissance units?
- How can naval collection assets and other Services, JTF, theater, and national collection assets be employed and integrated to support MAGTF operations?

Terrain

Terrain factors have a significant impact on intelligence collection operations, particularly on the ability of certain sensors to "see" through vegetation; requirements for line of sight communications; and employment considerations in intelligence collection operations and for the time-sensitive dissemination of collected intelligence products by MAGTF CIS. Many intelligence collection systems require line of sight with the target area to be effective. Accordingly, collection planners must assess the effects of mountains, defilade, vegetation, and other potential terrain obstacles on planned collection operations.

Weather

Weather is a key limiting factor in some collection operations. Bad weather may degrade identifying and locating targets. Weather can also limit the type of collection capabilities that may be employed. Low ceilings and poor visibility can decrease visual reconnaissance effectiveness and the resolution of photographic systems.

Threat

Detailed threat analysis must be conducted to determine the intelligence collection sensors and platforms that can be employed effectively against a given enemy and how to employ limited MAGTF and external resources to obtain the best possible intelligence. Collection operations can be hampered by the enemy's air defense capability and his camouflage, cover, concealment, and deception activities. Threat EW capabilities must be determined to assess their effects on UAVs, manned platforms radio uplink, and various downlinks.

Coordination with Maneuver and Fires

Maneuver and fires considerations include many issues requiring precoordination and several organizations and command echelons needed for the coordination. The detailed procedures needed to

execute maneuver and fires to collection and integration of collection operations into the MAGTF maneuver and fires scheme should be included in unit SOPs. Main operational issues follow:

- Requests and coordination of air support and integration within the air tasking order.
- Fires planning and necessary fire control measures (restricted fire areas and no fire areas).
- Necessary maneuver control measures (insertion and extraction requirements and plans to include short-notice emergency extractions).
- Collectors operating within subordinate unit AO under a wide range of command relationships.
- Collection missions being tasked to nonprimary intelligence collectors; i.e., infantry battalions, combat engineers, and pilots.
- Emergency action planning, to include escape and evasion planning.
- Other tasks to be performed or supported by other MAGTF units; e.g., sensor inserts.
- Integrating collectors within landing and other movement plans.
- Coordination, deconfliction, and management of UAV operations with other MAGTF air operations.

Communications and Information Systems

Whether communications are analog or digital, voice or data, secure or nonsecure, there are hosts of technical details to be addressed in the planning stages to ensure collection activities succeed. Key CIS requirements and planning considerations to support MAGTF collection operations follow:

- Ensure that the MAGTF CE G-2/S-2, intelligence battalion, intelligence collection elements, and other MAGTF units are included in the distribution of intelligence-related address indicator groups to receive pertinent JTF, theater, and national intelligence and CI products.
- Determine and coordinate radio nets requirements, supporting frequencies, and operational procedures; e.g., external to MAGTF, internal MAGTF, intelligence broadcasts, retransmission sites, routine and time-sensitive operations.
- Coordination of CIS activation and restoration priorities and supporting procedures.
- Communications security material system requirements for unique collection-related communications and related security material.
- Determine and coordinate wire communications, including telephones.
- Establish, operate, and manage unique collection communications.
- Determine and coordinate local and wide area networks and unique intelligence networks information systems requirements; e.g., hardware, software, Internet protocol addresses.
- Integrate collection element CIS operations with those of other MAGTF and pertinent JTF and other components intelligence and reconnaissance units; e.g., mutual support, cueing.
- Communications integration of collection elements employed in general support (GS) with other MAGTF elements; e.g., to provide time-sensitive reporting, coordination of maneuver.
- Coordination of collection CIS and dissemination operations and procedures with allied and coalition forces.
- Manual dissemination procedures; e.g., courier must be established and practiced.

Combat Service Support Availability

Logistical considerations affecting collection operations include the following:

- Batteries and other power requirements.
- Transportation.
- Water.
- Food.
- Ammunition.
- Integration of collector's embarkation and load plans into those of the supported unit.

Employment of MAGTF Intelligence Units

MAGTF intelligence units are employed to meet the requirements of the entire force. The MAGTF G-2/S-2 develops a concept of intelligence support, which employs these units on the basis of the MAGTF mission, PIRs, concept of operations, and commander's intent. This concept must integrate intelligence activities with operations to provide key intelligence to commanders to enable rapid and effective decisionmaking. Based on the results of IPB analysis and the concept of operations, assets are positioned to—

- Satisfy PIRs.
- Expose enemy vulnerabilities.
- Monitor key locations.
- Detect and assist in the engagement of targets.
- Identify opportunities as they arise in the battlespace.

Intelligence units are employed in GS or DS. Under GS, units are tasked by the MAGTF commander through his G-2/S-2 to satisfy the requirements of the entire force. Because of the limited number of specialized intelligence assets and their ability to develop intelligence that is relevant to current and future operations in all areas of the battlespace (deep, close, and rear), GS is the preferred support relationship. Under DS, the requirements of a supported commander are given priority. DS is used to focus intelligence support for particular phases of an operation or create enhanced intelligence nodes to support MAGTF subordinate elements. When MAGTFs smaller than a full MEF are deployed, they will normally be supported by attached, task-organized detachments from the intelligence battalion, the force reconnaissance company, and the radio battalion.

Focused Intelligence Support

Intelligence must be integrated with the mission, commander's intent, and concept of operations and should normally be weighted to support the main effort. The MAGTF intelligence structure has the flexibility to tailor its capabilities to meet the requirements of various types of expeditionary operations, and adapt to changing operational needs during execution. For each operation, the MAGTF G-2/S-2 will assess IRs and develop a concept of intelligence support that positions assets where they can best satisfy those requirements. Intelligence nodes will focus support within the MAGTF. Split-basing will build intelligence nodes within and outside the AO to deliver comprehensive and reliable intelligence support while reducing the size of the deployed force. Intelligence units and DS teams are employed to tailor and enhance the capabilities of organic intelligence sections or to create task-organized intelligence nodes in response to specific requirements.

Task Organization of Intelligence Support Units

Task organization of intelligence support units is one of the principal means for the MAGTF commander to shape the intelligence effort. Collection, exploitation, and unique production capabilities of specialized intelligence units significantly enhance the ability of supported G-2/S-2 sections to develop timely, mission-focused intelligence. Intelligence battalion, force reconnaissance company, and radio battalion elements task-organize to provide tailored intelligence capabilities. Specific capabilities

provided are based on the threat, the supported unit's anticipated requirements (as determined through IPB), and the concept of operations.

Elements from some or all of the intelligence battalion's subordinate companies combine into intelligence battalion detachments. The CI/HUMINT company provides HUMINT exploitation teams (HETs). The radio battalion forms task-organized SIGINT support units (SSUs), which provide a mix of SIGINT and EW capabilities. When MAGTFs smaller than a full MEF deploy, an intelligence battalion detachment, a HET, force reconnaissance platoons, and a radio battalion SSU will normally be attached to the MAGTF CE. In MEF operations, when the entire radio battalion, intelligence battalion, and force reconnaissance company are employed, detachments, HETs, SSUs, and platoons may be placed in DS as required. Those subordinate units provide tailored intelligence capabilities to create an enhanced intelligence node to support an MSC or other MAGTF element.

Intelligence Direct Support Teams

Intelligence DS teams are organic to the intelligence battalion and each of the division, Marine aircraft wing (MAW), and force service support group G-2/S-2 sections. Teams are made up of one officer and several enlisted personnel who have a mix of intelligence specialty skills. DS teams provide an enhanced analytical and dissemination capability to a unit intelligence section and link the intelligence structure to the supported units. As assigned by the G-2/S-2, they augment the supported unit's intelligence section to carry out the following tasks:

- Perform analysis and production to support future operations.
- Tailor all-source fusion center and other external source intelligence products to the needs of the supported commander.
- Assist in the management of external intelligence support requirements.
- Facilitate dissemination of intelligence received from external sources.

The MEF and MSC G-2/S-2s use their DS teams to tailor and focus intelligence support to units designated as the main effort or to create enhanced intelligence nodes at key times and places in the battlespace. See MCWP 2-1.

Precrisis (Garrison/Peacetime) Intelligence Collection

The predominant collection focus during precrisis phases is obtaining basic or encyclopedic intelligence on the AO and current intelligence on the threat. In researching current or basic intelligence, intelligence analysts will consult various databases or online sources. National and theater resources are relied on heavily.

The Planning Phase

The planning phase is a critical phase where the foundation of intelligence preparation is set for the duration of the operation. There is an enormous demand for intelligence information and pressure to produce a high volume of intelligence in a very short time. The paradox is that although requirements will be very high, intelligence personnel are constrained by a lack of physical ability to collect before actual contact and a short time span to produce results. The lack of time is complicated by a need to prepare the intelligence collection section and units to conduct predeployment activities. Reliance on national and theater intelligence resources is still the predominant theme. The primary focus of collection is on basic or encyclopedic intelligence if this was not adequately done during the precrisis phase; otherwise the collection effort is

concentrated more on supporting current and estimative intelligence in support of operational planning. During planning, intelligence focuses on describing the battlespace through IPB and satisfying the commander's critical IRs and related PIRs. See MCWP 5-1, *Marine Corps Planning Process*.

Intelligence Collection During Execution

Intelligence collection during execution differs significantly from intelligence collection during planning.

Intelligence collection support during the precrisis or warning phases requires developing a large volume of basic intelligence and preparation of broad-scope estimates needed to develop and analyze COAs. However, *intelligence collection support during the execution phase must try to satisfy a much larger body of IRs in a significantly greater degree of detail*. For example, the nature of the intelligence required by a MAGTF commander to decide if a noncombatant evacuation operation is feasible differs radically from the type and detail of intelligence required by the mission commander who will execute the operation.

Another major difference is the time available to satisfy IRs. In the *execution phase there is a significant increase of time-sensitive IRs. Intelligence must often be developed in hours, minutes or even seconds*. Success often depends on the ability to provide immediate answers to critical questions regarding threat force dispositions and intentions.

Once the execution phase begins, the clash of opposing forces normally causes significant changes in the situation. *The changing nature of requirements accelerates*. Predicting enemy capabilities and intentions becomes increasingly difficult once the execution phase begins, but it is specifically during this period that the commander requires detailed and accurate intelligence to reduce uncertainty.

National and theater resources continue to be employed but a greater reliance may be placed on organic assets, particularly those in support of forward-deployed forces. Collection planning remains centralized but may be decentralized once a main effort is established and assets are attached to or placed to support the main effort.

The combined factors of the wide-ranging nature of IRs, the degree of detail required, the limited time available, and the uncertainty inherent during execution combine to make collection support to execution the most significant intelligence challenge. Collection managers must be prepared to meet this challenge and provide the flexibility required to deliver continuous situational awareness, identify opportunities, and facilitate rapid decisionmaking during execution.

Current Operations

The collection support effort during current operations consists primarily of answering previously developed intelligence reporting criteria and emerging requirements that arise as opposing forces clash. Coordination of ongoing and planned collection operations with other intelligence collectors and all current operation centers or battlefield agencies is emphasized. Factors critical to ensuring timely and effective dissemination are established and intelligence reporting criteria are widely disseminated. Each intelligence collector or the reporting unit; i.e., SARC or reconnaissance operations center, must be able to evaluate and assess the relevance of information to the ongoing operations. Each piece of collected data must undergo an immediate tactical processing and assessment before dissemination. A keen situational awareness and understanding of the unit's OPLAN/OPORD is required by all intelligence personnel, including collection managers and SARC personnel. Support must include intelligence collection to support deep and rear operations, resisting the natural tendency to focus on the close battle. Support to current operations

must be balanced against the requirement to support future operations. All assets cannot be devoted to current operations at the expense of supporting planning for future operations.

Future Operations

Intelligence collection support to future operations represents only a small portion of the collection effort, but merits discussion. Support is influenced by the timeframe and scope of the operation, level of command, identification of PIRs, and availability of collectors. One collection strategy discussed earlier endorsed "fencing of collection assets." One of the primary contributions of intelligence collection support to future operations is support to BDA that inputs to combat assessment, which in turn helps determine the nature of future operations. The collection operations officer's role is crucial. Continuous interaction by the collection operations officer and the intelligence plans officer in the future operations cell and the MAGTF P&A cell OIC is key to focusing intelligence collection efforts to support future operations. As decisions are made, ICRs and priorities for specific collection missions and tasks are generated and assessed against previously identified requirements.

APPENDIX A
SAMPLE INTELLIGENCE REQUIREMENTS WORKSHEET

MEF IR Number (1)	Requester IR Number (2)	DTG Received (3)	Subject (4)	Action (5)	Status (6)
04-1012	1st Marine Division Number 04-001	090830 Jan	Reconnaissance activity in NAI 32	SOR Numbers 04-1462 (UAV) 04-1463 (GSP) 04-1464 (Force Reconnaissance)	
04-1013	MEF Engineer	090900 Jan	Obstacle system at Objective SCHMIDT	For situation template	Closed 091630 Jan
04-1014	MEF G-2/P&A Cell	101100 Jan	Imagery of landing beaches	Forwarded to JTF J-2 for national collection	Pending

Column 1: The MEF IR number for ease of tracking.

Column 2: The originating requester IR number is posted to correlate subordinate requirements with the MAGTF. If the requirement is generated by the MAGTF CE, list that office. *Note: for requirements that are forwarded to higher headquarters, no notation is made.*

Column 3: When the information requirement is received.

Column 4: A succinct description indicating the information requirement subject.

Column 5: What SORs are germane to this requirement. *Note: one example identifies the collection system tasked to satisfy each SOR.*

Column 6: The information requirement is still active, pending or closed.

APPENDIX B
SAMPLE INTELLIGENCE COLLECTION WORKSHEET DESCRIPTION

Period Covered (From 21 Jan ____ to Seizure of Objective Schmidt)

Collection planning for a particular operation commences with the receipt or deduction of a mission by the commander and continues until the mission is accomplished. The collection worksheet covers the period from initiation of planning until accomplishment of the mission. However, in an amphibious operation, certain IRs may be directly related to various phases of the operation or must be satisfied as a prerequisite to other planning; e.g., IRs about location of suitable beaches or helicopter landing zones must be satisfied long before the actual assault. Therefore, the period entered at the top of the form may be less than that of the plan as a whole. The worksheet must be revised as IRs develop or no longer apply, as available collection agencies change in number and type, and as specific collection missions become obsolete. To accommodate the revisions, a collection worksheet should be maintained in loose leaf form.

Column 1, PIRs

Lists the IRs that must be satisfied. These include the PIRs and other IRs.

Column 2, Indicators

For each PIR and IR, the intelligence officer lists the indicators derived from an analysis of the enemy and the characteristics of the objective area or target indicator for each PIR/IR. Indications are positive or negative evidence. There usually is more than one indicator for each PIR/IR. When available, they will satisfy the particular requirement. Indications form the basis for developing SIRs and SORs for the collection of information.

Column 3, SIRs

Contains the specific information required; i.e., "the collectible info" that will substantiate or refute each indication listed in column 2.

Having determined what indications point to the solution of a particular IR, the intelligence officer next determines what information is needed to substantiate or refute each indication. For example, if removal of mines and obstacles is an indication of an enemy attack, then the SIR is if the enemy is actually removing mines and obstacles.

Reluctance of prisoners to remain in forward areas may be an indication of enemy preparations to employ nuclear weapons. The SIR is whether or not prisoners demonstrate any marked eagerness to be evacuated from the combat area.

Improvement of enemy positions may be an indication of defense. The SIR is if the enemy is actually improving his positions.

Information to be sought then becomes the basis for SORs for collection of information. A collection agency in most cases is not assigned full responsibility for establishing that any particular indication exists.

For example, increased patrolling may be an indication that an enemy is preparing to attack. A rifle company would not be asked if there was an increase in enemy patrol activity in its sector. Instead, the specific information to be sought that forms the basis for an order to the company would be to report the frequency of enemy patrols encountered in its sector.

Another indication of attack might be forward echeloning of artillery. The specific information to be sought by a collection agency is not if artillery is being echeloned forward but to report the location of artillery in certain forward areas.

In the above two examples, the intelligence officer is the one in the best position to make proper deductions. From the information he receives and after comparison with information already available, the intelligence officer can deduce if there has been an increase in enemy patrolling, and if the enemy artillery is being echeloned forward to support the attack.

The intelligence officer carefully studies the AO and the known enemy situation to focus the collection effort on a specific area; e.g., in developing specific information to be sought on possible enemy reinforcement, the intelligence officer studies the road nets and suitable avenues of approach to determine logical routes that enemy reinforcements would move. The specific information to be sought then becomes the volume and type of traffic along a particular road or in a particular area. The intelligence officer then has a basis for developing plans for aerial reconnaissance or establishing observation posts.

Column 4, Agencies to be Employed

List all currently available agencies. The list includes not only subordinate units but also higher and adjacent commands that gather information of value. In addition to troop units, the list of agencies includes intelligence specialists such as CI, imagery interpretation, and interrogation-translator personnel. The listing of troop units is not restricted to combat elements.

Following his determination of the specific information to be sought, the intelligence officer selects the collection agencies that will be tasked to furnish information. In making his selections, he is guided by considerations of capability, suitability, multiplicity, and balance.

Orders and RFIs are issued only to those agencies that are physically capable of providing it in time of use. The intelligence officer must be cognizant of the location, status, and current and projected missions of all available agencies.

Agencies selected to gather information are those best suited for the task; e.g., a trained force reconnaissance unit is normally better suited for amphibious reconnaissance than a patrol from a rifle company. An information collection mission is consistent with the tactical or logistics officer. Suitability also includes consideration of economy of force. Before an agency is selected for a particular task, the intelligence officer considers what other collection tasks the agency might accomplish simultaneously.

Information is evaluated and interpreted to derive intelligence. Accurate evaluation requires comparison of information obtained from several sources and agencies. Whenever possible, the intelligence officer selects more than one agency to collect information (redundancy).

Finally, the intelligence officer endeavors to balance the collection workload among available agencies. Although desirable, balance is the least important consideration in the selection of agencies, and more often, careful consideration of capabilities and suitability results in adequate distribution of the workload.

Column 5, Place and Time to Report

Reflects the place and time that information is to be reported. Information that arrives too late is of no value. The intelligence officer must effectively meet the needs of the commander, other staff officers, and higher, adjacent, and subordinate units.

- Be specific, especially for electronic reporting. When reporting via automated information and communications systems, a requester should be very specific; e.g., if an actual image

is requested, how should it be disseminated? Posted on a classified web page? Posted on an imagery dissemination server? If so, which one? If an electronic file transfer is desired, what is the Internet protocol address and circuit the requester uses? Any special report formatting requirements should be included if a nonstandard product is requested.

- One-time versus periodic reporting. For reconnaissance missions, one-time reporting may be sufficient. For surveillance missions, periodic reporting is usually required. Requirements supporting target or area surveillance should have details on how frequently reports are to be generated.
- Include LTIOV. The LTIOV is an appropriate entry in the reporting column. Entries may specify an exact time for reporting and/or not-later-than times for periodic reports (or at such times that information is obtained). Negative reports, if desired, are also indicated.
- Routine vs time-sensitive. Clearly identify criteria and reporting channels for routine and time-sensitive reports.

Column 6, Remarks

Miscellaneous remarks on the progress of the collection are recorded in column 6 of the worksheet. The intelligence officer develops a simple code to indicate PIRs/IRs that require revision or cancellation. Prompt cancellation of orders and requests for collection of information, including PIRs, is mandatory if the efforts of collection agencies are to be focused properly. A unit SOP for intelligence functioning normally provides for routine reporting of certain types of information. A note is made in the collection worksheet when certain information requirements are covered by the SOPs; e.g., the reporting of minefields may be prescribed by the unit SOP. A requirement for information on the enemy's use of mines can be handled by placing "SOP" in column 6, and responsibility need not be indicated under agencies. However, a requirement for reporting the location of minefields in the vicinity of a specific area is not treated as an SOP item. Finally, the intelligence officer notes those specific information requirements that can be combined into a single order of request to an agency.

PIRs	Indicators	SIRs	Agencies to be Employed									Place and Time to Report	Remarks
			DIV	MAW	FSSG	CI/HUMINT	VMU	RadBn	VMAQ	ForceRecon	GSP		
Will the 3d Tank Division enter NAI 8 or 9 on the evening of 22 January?	Dispersal of tanks and self-propelled artillery to forward positions.	Will more than 220 combat vehicles of 3d Tank Division pass through NAI 8 or 9 between 221600 and 230400 January? Will more than 38 artillery weapons subordinate to 3d Tank Division enter NAI 8 or 9 between 221600 and 230400 January?	X	X	X	X	X			X	X	Report by fastest means to MEF G-2 LTIOV: 230400 January	
	Increased communications by 3d Tank Division elements.	Are enemy tactical radios active in NAI 8 or 9 before 230400 January?	X	X	X			X	X			Report by fastest means to MEF G-2 LTIOV: 230400 January

TAB A (Intelligence Collection Plan) TO APPENDIX 10 (Intelligence OPLAN) TO ANNEX B (Intelligence) TO OPLAN

(U) REFERENCES:

(a) Theater TTP
(b) MEF Tactical SOP
(c) MCWP 2-1

1. (U) Situation. Remaining Orange Force is defending against the Blue Force's advance to prevent the destruction of the ruling regime in the capital city of Orangeville. They intend to delay and attrite Blue Force to such an extent that US resolve to continue the war will fail, allowing the Orange regime to survive through diplomatic means.

(a) (U) See FRAGO.
(b) (U) Enemy situation.
(c) (U) Most dangerous COA.
(d) (U) Most likely COA.

2. (U) Mission. To provide R&S of MEF battlespace to support Blue Force attacks in zone, confirm conditions for amphibious landing, and determine status of Orange Force's location.

3. (U) Execution

a. (U) National and theater collection will be requested to support MEF deep IRs (beyond forward boundary/deep battle synchronization line), threats to MEF flanks and logistic support bases, and against threats within MEF's boundaries beyond organic collection capabilities. Of particular in-

CLASSIFICATION

terest are enemy strategic and operational reserve forces that could influence MEF advance, and indications of Orange Force use of weapons of mass destruction.

(1) (U) In accordance with references (a) and (b), and as the Blue Force supporting effort during this operation, MEF battlespace R&S will rely heavily on organic aviation and battlefield surveillance/collection assets to satisfy IRs to support the close and deep fight.

(2) (U) Due to the location of the ground component commander to the flank and rear, and the commander, amphibious task force (CATF)/commander, landing force (CLF) relationship to execute an amphibious landing, MEF will request lateral intelligence reporting from the ground and naval component commanders. Lateral ground component commander intelligence reporting to MEF will facilitate cross-boundry operations and rear area operations/support requirements. Lateral naval component commanders intelligence reporting will support the movement of MEF's operating in littoral areas, and assist in determining enemy activity within the battlespace.

(3) (U) Upon chop of the CLF to MEF, selected R&S assets DS of CATF will become operational control to the MEF G-2.

(4) (U) Organic Focus. All organic R&S assets will focus on satisfying MEF PIRs/IRs. Ground-based SIGINT collection will focus on indications and warning force protection reporting to the supported commander. Forward CI and HUMINT assets will provide the supported commander with tactical interrogations and refugee debriefs; rear area CI assets will provide CI force protection source operations. MEF ground R&S operations will provide continuous observation and operate in vicinity of MEF NAIs and targeted areas of interest as directed. Visual aerial reconnaissance will provide timely battlespace awareness within the MEF AO, and support time-sensitive and ad hoc emerging IRs utilizing in-flight and post mission reporting. Ground sensor operations will be focused along major lines of communications (LOCs) and boundaries within and along the MEF area of responsibility. Organic MEF UAVs will be flown in GS of MEF operating forces. All collection disciplines will support personnel recovery operations as required.

b. (U) Concept Of Operations

(1) (U) The MEF R&S Plan will be divided in the following three stages:

- Stage A: Prechop of landing force.
- Stage B: Postchop of landing force.
- Stage C: Seizure of Orangeville.

CLASSIFICATION

(2) (U) Stage A: Prechop of Landing Force. During Stage A, R&S focus will be—

- Protection of our MEF units.
- Intentions of enemy forces able to influence MEF flanks, the amphibious landing zone or moving into adjacent units.
- Determining if conditions are met for MEF to assume operational control of landing force.
- Disposition of Orange Force's operational reserve forces that could move to impede MEF's movement.
- Status of LOCs.
- Disposition of enemy forces in the vicinity of Orangeville.

(3) (U) Stage B: Postchop of Landing Force. During Stage B, R&S focus will be—

- Disposition of Orange Force's operational reserves that could impede the MEF's movement or move into an adjacent unit's zone.
- Orange Force's operational reserves that could attack MEF's flanks.
- Status of LOCs from Badguyburg to Orangeville.
- Threats to MEF's rear area.
- Potential areas for interdiction west of Orangeville.

(4) (U) Stage C: Seizure of Orangeville. During Stage C, R&S focus will be—

- Disposition of enemy forces in the vicinity Orangeville.
- Enemy forces that can influence LOCs.
- Identification of enemy units able to attack Blue Force's flanks.
- Threats to Blue Force rear area.
- Potential areas for interdiction west of Orangeville.
- Suspected movement of Orange Force.

(5) (U) Concept for SIGINT Collection. MEF organic ground-based SIGINT collection assets are in GS of MEF and DS of the supported commander. Theater and national SIGINT collection will be requested as required.

(a) (U) Communications Intelligence. MEF organic ground-based communications intelligence collection will focus on indications, warning reporting, and force protection to the supported commander. Collection emphasis will be—

- Range Force's corps and C2 divisions.
- Artillery fire direction nets.
- Success of Blue Force's deception plan as to actual location of amphibious landing site.

CLASSIFICATION

(b) (U) Electronic Intelligence. Blue Force electronic intelligence surveillance support will focus on indications and warning reporting and force protection of Blue Force. Collection emphasis will be—

- PIR support.
- Locating remaining radar guided air defense weapons.
- Indications of possible air attacks within MEF AO.
- Indications of possible employment of weapons of mass destruction.

(6) (U) Concept for CI/HUMINT Collection. Forward CI/HUMINT assets will focus on—

- Force protection.
- Assisting in Blue Force deception plan as to actual location of amphibious landing site.
- Assisting in Blue Force deception plan to convince Orange Force national-level commanders that MEF is the Blue Force main effort.
- Conducting tactical interrogations to support the commander's PIRs/IRs. Rear area CI assets will provide CI force protection source operations. Postchop, selected CATF assets will become operational control to MEF and report and receive tasking from the MEF G-2.

(7) (U) Concept for Ground R&S Collection. MEF ground R&S operations will be conducted with—

- MSC ground reconnaissance assets having collection responsibility from forward line of troops to other phase lines in effect.
- MEF force reconnaissance assets (force reconnaissance companies and radio battalion radio reconnaissance teams) having collection responsibility from fire support coordination line to forward boundary/deep battle synchronization line.
- DS unconventional warfare forces having collection responsibility beyond the forward boundary/deep battle synchronization line. Cross-boundary ground R&S operations will be conducted by MEF vice MSC ground R&S assets. Postchop, selected CATF ground R&S assets will become operational control to MEF, and report and receive tasking from the Blue Force G-2.

(8) (U) Concept for Aerial Visual R&S Collection. MEF aerial visual R&S collection will center on the aviation assets of the MAW. Because of the dynamic reporting capability of aircraft operating within the Blue Force battlespace, aerial visual R&S will provide timely battlespace awareness, and support time-sensitive

CLASSIFICATION

and adhoc emerging IRs utilizing in-flight and post mission reporting. Time-critical ad hoc IRs will be forwarded to the tactical aircraft command center via the MEF air officer. When directed, positive and negative reporting is required in specific collection requirements or emphasis.

(9) (U) Concept for Ground Sensor Collection. MEF will provide GSP squads to ground maneuver commands in DS to facilitate close battle operations. GSP assets retained by the MEF collection management and dissemination officer will be focused along major LOCs and command boundaries within and along the MEF area of responsibility. Postchop, selected CATF ground sensor assets will become operational control to MEF, and report and receive tasking from the MEF G-2.

(10) (U) Concept for UAV Collection. Organic MEF UAV will be flown in DS and GS of MEF maneuver forces. Remote receive stations will be collocated with maneuver forces to allow rapid transfer of time-critical information. The aviation combat element commander will recommend possible forward base locations for future operations.

(11) (U) Concept for Aerial Imagery Collection. Requests for national and theater imagery collection will be forwarded to higher headquarters for satisfaction. Aerial imagery collection will support recurring IRs along LOCs or against point targets.

c. (U) Tasks

(1) (U) GCEs

(a) (U) 1st Marine Division (MARDIV)

1 (U) Conduct organic R&S operations in zone to the intelligence handover line in effect.

2 (U) Debrief all organic R&S teams providing intelligence reports to MEF G-2 operations within 6 hours.

3 (U) Receive and incorporate one squad from the GSP in DS for R&S operations. Implanting of sensors is the responsibility of supported unit.

4 (U) Assist in recovery of MEF and unconventional warfare R&S assets in zone.

5 (U) Evacuate captured personnel and materiel from the forward collection point to the central collection point by most expeditious means possible. Enforce tagging procedures in accordance with reference (b). Interrogations will only be conducted by MEF HUMINT personnel.

CLASSIFICATION

6 (U) Receive and incorporate one company (1st/2d) Radio Battalion (-) (Reinforced) in DS.

7 (U) Receive remote receive station team from Marine unmanned aerial vehicle squadron (VMU)-1.

8 (U) Receive CI/HUMINT elements in GS.

(b) (U) 2d MARDIV

1 (U) Conduct organic R&S operations in zone to the intelligence handover line in effect.

2 (U) Debrief all organic R&S teams providing summary reports to MEF G-2 operations within 6 hours.

3 (U) Assist in recovery of MEF and unconventional warfare R&S assets in zone.

4 (U) Evacuate captured personnel and materiel from the forward collection point to the central collection point by most expeditious means possible. Enforce tagging procedures in accordance with reference (b). Interrogations will only be conducted by Blue Force HUMINT personnel.

5 (U) Receive remote receive station team from VMU-1.

6 (U) Receive and incorporate one squad from the ground sensor platoon in GS for R&S operations. Implanting of sensors is the responsibility of supported unit.

(c) (U) 3d MARDIV (Stages B and C)

1 (U) Maintain DS R&S units until notified otherwise by this HQ.

2 (U) Conduct organic R&S operations in zone as directed.

3 (U) Debrief all organic R&S teams providing intelligence reports to the MEF G-2 operations within 6 hours.

4 (U) Assist in recovery of MEF and unconventional warfare R&S assets in zone.

5 (U) Evacuate captured personnel and materiel from the forward collection point to the central collection point by most expeditious means possible. Enforce tagging procedures in accordance with reference (b). Interrogations will only be conducted by MEF HUMINT personnel.

6 (U) Receive remote receive station team from VMU-1.

CLASSIFICATION

(d) (U) 4th MARDIV (Stages B and C)

1 (U) Conduct organic R&S operations in zone to established phase lines in effect.

2 (U) Debrief all organic R&S teams providing summary reports to MEF G-2 operations within 6 hours.

3 (U) Assist in recovery of MEF and unconventional warfare forces R&S assets in zone.

4 (U) Evacuate captured personnel and materiel from the forward collection point to the central collection point most expeditious means possible. Enforce tagging procedures in accordance with reference (b). Interrogations will only be conducted by MEF HUMINT personnel.

5 (U) Receive remote receive station team from VMU-1.

(2) (U) MAW

(a) (U) Provide timely intelligence reports as required to MEF G-2 operations officer.

(b) (U) Use strike camera to greatest extent possible to support first phase BDA.

(c) (U) Conduct UAV operations from Texaco forward arming and refueling point until a forward site for control can safely be established and maintained.

(d) (U) Provide two man operation planning/liaison team (UAV detachment) to MEF SARC.

(e) (U) Provide emergency extract package of ground R&S units as required.

(f) (U) Receive a CI element in GS.

(g) (U) Conduct preplanned and ad hoc visual aerial reconnaissance.

(h) (U) Provide remote receive station team to MEF CE.

(i) (U) Provide remote receive station team to 1st MARDIV.

(j) (U) Provide remote receive station team to 2d MARDIV.

(k) (U) Provide remote receive station team to 3d MARDIV.

(l) (U) Provide remote receive station team to 4th MARDIV.

CLASSIFICATION

(m) (U) Provide two-man UAV liaison teams to MEF SARC.

(n) (U) Conduct UAV displacement operations with minimal reduction of battlespace surveillance.

(o) (U) Receive ground sensor platoon liaison team to support airborne sensor implant planning.

(p) (U) Conduct airborne sensor implant when directed.

(3) (U) FSSG (-)(Reinforced)

(a) (U) Provide intelligence reporting of any enemy activity within AO to MEF G-2 operations officer.

(b) (U) Provide bridge, route, ford, and other mobility reports in accordance with reference (c) for all main/critical routes to MEF G-2 P&A cell.

(c) (U) Receive a CI element in GS.

(d) (U) Conduct ground sensor recovery operations when directed.

(4) (U) Rear Area Operations Group

(a) (U) Provide R&S reporting from adjacent headquarters/units to MEF G-2 operations officer as soon as feasible.

(b) (U) Evacuate captured personnel and materiel from the forward collection point to the central collection point by most expeditious means possible. Enforce tagging procedures in accordance with reference (b). Interrogations will only be conducted by MEF HUMINT personnel.

(c) (U) Receive a CI element in GS.

(d) (U) Conduct ground sensor recovery operations when directed.

(5) (U) Marine Engineer Group

(a) (U) Provide bridge, route, ford, and other mobility reports in accordance with reference (c) for all main/critical routes to MEF G-2 P&A cell.

(b) (U) Evacuate captured personnel and materiel from the forward collection point to the central collection point by most expeditious means possible. Enforce tagging procedures in accordance with reference (b). Interrogations will only be conducted by MEF HUMINT.

CLASSIFICATION

(6) (U) Force Artillery Headquarters

(a) (U) Provide counterfire battery radar reports to MEF SARC OIC as soon as possible.

(b) (U) Evacuate captured personnel and materiel from the forward collection point to the central collection point by most expeditious means possible. Enforce tagging procedures in accordance with reference (b). Interrogations will only be conducted by MEF HUMINT personnel.

(7) (U) MEF Organic Collection Elements

(a) (U) Force Reconnaissance Company (-) (Reinforced)

1 (U) Implant ground sensor strings and relays as directed.

2 (U) Provide two-man operational planning liaison team (force reconnaissance detachment) to MEF SARC.

3 (U) Conduct simultaneous operations to support MEF Alpha and Bravo command post displacement.

4 (U) Provide restricted fire area coordination and deconfliction of all ground R&S assets within MEF AO.

5 (U) Provide strategic and theater ground reconnaissance planning support as required.

6 (U) Assume operational control of selected CATF ground R&S assets postchop.

7 (U) Engage targets of opportunity with MEF force fires authorization.

8 (U) Provide targeting for fire support systems.

(b) (U) Intelligence Battalion. Provide the following R&S support:

1 (U) GSP (-) (Reinforced)

a (U) Provide one GSP squad in DS of 1st MARDIV.

b (U) Provide one GSP squad in GS of 2d MARDIV.

c (U) Provide two-man operational planning liaison team (GSP detachment) to the MEF SARC.

d (U) (U) Be prepared to conduct simultaneous operations to support MEF Alpha and Bravo command post displacement.

CLASSIFICATION

e (U) Provide GSP liaison team to MAW for airborne sensor implant planning.

f (U) Assume operational control of selected CATF ground sensor assets postchop.

2 (U) CI/HUMINT Unit

a (U) Conduct CI/force protection operations in MEF AO.

b (U) Conduct HUMINT operations supporting R&S plan.

c (U) Conduct tactical interrogations to support MEF PIRs/IRs.

(c) (U) Radio Battalion (-)(Reinforced)

1 (U) Provide one company (1st/2d) Radio Battalion (-)(Reinforced) in DS of 1stMARDIV.

2 (U) Provide a SIGINT support platoon in GS to 2dMARDIV.

3 (U) Radio reconnaissance teams will be in DS of MEF.

4 (U) Coordinate operational planning for insertion/extraction of radio reconnaissance teams with force reconnaissance company.

5 (U) Provide two-man operational planning liaison team (radio battalion detachment) to the MEF SARC.

6 (U) Conduct simultaneous operations to support MEF Alpha and Bravo command post displacement.

7 (U) Provide electronic intelligence support for battlespace surveillance in accordance with internal SOPs.

d. (U) Coordinating Instructions

(1) (U) Assignment of Responsibility for Drafting of Tabs to this appendix. The MEF CM/DO will conduct a working group comprised of MSC collection requirement managers and MEF collection operation managers to discuss this appendix and to identify and assign initial responsibilities to execute this R&S plan. On completion of the working group, each command or unit responsible for the development of a supporting tab that addresses the operations management of the specific collector will draft and forward this tab to the MEF CM/DO for review and dissemination. When applicable, tabs should address the tasking, processing, exploitation, and dissemination of collected information from the collector to the MEF G-2. Command/unit responsibility for specific tabs are:

CLASSIFICATION

(a) (U) Tab A: SIGINT Employment Plan. MEF SIGINT officer coordinated with radio battalion.

(b) (U) Tab B: CI/HUMINT Employment Plan. MEF CI/HUMINT coordinated with intelligence battalion.

(c) (U) Tab C: Ground R&S Plan. Force Reconnaissance Company coordinated with MEF SIGINT officer.

(d) (U) Tab D: Visual Aerial Reconnaissance and Surveillance Plan. MAW.

(e) (U) Tab E: Ground Sensor Surveillance Plan. Intelligence battalion.

(f) (U) Tab F: UAV Employment Plan. MAW.

(2) (U) PIRs

(a) (U) Determine if the 7th Division will attack the MEF flank from H-Hour to H+24.

(b) (U) Determine if the 1st Armored Brigade will displace to counter amphibious landing from H-Hour To H+36.

(c) (U) Determine if the 1st Provincial Guard Corps will defend in the vicinity of Badguyburg in regiment or larger strength from H+36 To H+96.

(d) (U) As soon as practical, MSCs will identify PIRs and submit requests for collection support in accordance with this appendix.

(3) (U) IRs

(a) (U) Determine the movement of major Orange Force's units in MEF's area of responsibility.

(b) (U) Location of Orange Force's long-range artillery that can range MEF forces.

(c) (U) Projected weather conditions.

(d) (U) Any other changes to the assessed enemy COAs.

(4) (U) NAIs. (Read across Number/Location/Description/Activity)

(a) (U) 1/Grid location/southwest movement from Nashville by 1st Armored Brigade.

CLASSIFICATION

(b) (U) 2/Grid location/road junction Route 20/movement west of 1st Armored Brigade.

(c) (U) 3/Grid location/road junction I-95 and north/south Country Road/ movement west of 7th Division.

(d) (U) 4/Grid location/road/movement south of 1st Armored Brigade.

(e) (U) 5/Grid Location/Intersection Route 1 and Bangor Road/enemy movement southwest or southeast from Badguyburg.

(f) (U) 6/Grid location/Intersection Route 1 and Highway 101/east movement of 1st Provincial Guard Corps.

(g) (U) 7/Grid location /road junction Route 66 and unidentified road/southeast movement of 1st Provincial Guard Corps.

(5) (U) MEF CM/DO will coordinate and deconflict with higher headquarters MEF NAIs that correspond to or have been identified as a combatant commander's NAI. The MEF CM/DO will also coordinate and deconflict MEF NAIs.

(6) (U) MEF subordinate commands will prepare organic R&S plans to satisfy organic PIRs/IRs. MEF MSCs will submit organic R&S plans to the MEF CM/DO as directed.

4. (U) Logistics

5. (U) Command And Communications

a. (U) Command

(1) (U) Command Relationships

(a) (U) J-2 has staff responsibility for employment of theater and national intelligence collection assets.

(b) (U) MEF G-2 CM/DO is responsible for coordinating the employment of MEF organic R&S assets and requesting R&S support through appropriate channels to cover gaps in organic collection capability to support combatant commander and MEF PIRs.

(c) (U) The MEF SARC is responsible for:

1 (U) Initial planning and coordination for the operational employment of MEF organic collection assets to support this operations plan.

CLASSIFICATION

2 (U) Monitoring and reporting the status and location of MEF organic collection assets

3 (U) Collecting and reporting combat intelligence/information to the MEF P&A cell.

(d) (U) The MEF SARC OIC will assist the MEF CM/DO in developing, publishing, and revising this appendix as required.

b. (U) Communications. MSC R&S assets will establish communications connectivity between tasked organic units and the MEF SARC via G-2 unclassified or secret networks.

c. (U) Reporting. Timely reporting from organic collection operation centers via established communications paths and procedures will support reactive targeting opportunities and analysis of perishable tactical information.

d. (U) Requesting Procedures. Requests for intelligence support beyond the capabilities of MSCs will be submitted as a production requirement/collection requirement via the chain of command to MEF using the procedures outlined in reference (b).

APPENDIX D
SAMPLE COLLECTION STATUS UPDATE PARAGRAPH FORMAT

Collection Status Update Paragraph. A collection status update paragraph may be included as part of a unit's daily intelligence summary (INTSUM) in order to notify higher, adjacent, and critically, lower units of the MAGTF's current ICRs and planned collection operations over some specified future period. As a snapshot of the near term requirements, it can be used to review active and cancelled requirements and update a unit's collection priorities and collection plan daily. Using the basic format, units can tailor the INTSUM to fit the situation. With new automated information systems, INTSUMs are increasingly produced in graphic form and posted on networks for wide dissemination, with links to detailed supporting intelligence products, reports, and databases. An example of a written collection status update paragraph follows:

COLLECTION STATUS UPDATE

A. DURING THE PERIOD 040800T TO 050759T MAR 2004, THE MEF COLLECTION PRIORITIES ARE AS FOLLOWS:

PRIORITY	PIR/IR NO.	ITEM
1	1	SIGINT SUPPORT TEAM (SST) A TO EXECUTE MISSION BRAVO VIC NAI 003.
2	1	AVIATION SST UNIT TO EXECUTE MISSION CHARLIE VIC NAI 003.
3	1	AERIAL RECON MISSIONS TO PROVIDE COVERAGE OF I MEF AO ACCORDING TO AERIAL SURV PLAN (TRACKS NASHVILLE AND DAYTONA) IN MOBILITY CORRIDOR CHARLIE.
4	2	SST TEAM C TO EXECUTE MISSION ECHO VIC NAI 005.

B. CANCELLED REQUIREMENTS. THE FOLLOWING PRIORITY INTELLIGENCE REQUIREMENTS HAVE BEEN SATISFIED OR CANCELLED.

PIR NO.	DESCRIPTION
5	IMAGERY AND TEXT STUDIES OF POINT OF ENTRY VIC PORT HIDALGO. SPECIAL ATTENTION TO COASTAL LANDING BEACHES AND HELICOPTER LANDING ZONES.

C. PLANNED INTELLIGENCE COLLECTION MISSIONS. THE FOLLOWING MEF INTELLIGENCE COLLECTION MISSIONS ARE PLANNED FOR EXECUTION DURING THE PERIOD 050800T TO 060759T MAR 2004.

PRIORITY	PIR/IR NO.	ITEM
1	2	EA-6B/PROWLER UNIT A TO COLLECT IAW TASKING PER AIR TASKING ORDER.
2	3	HELO INSERTION OF GROUND RECON TEAM 111 INTO RESTRICTED AREA OF OPERATIONS 111 VIC NAI 006.
3	3	3RD GSP TO CONDUCT SENSOR EMPLACEMENT OPERATIONS IN MOBILITY CORRIDOR MESA.

VO . . . . . validation officer

SECTION II
DEFINITIONS

area of operations—An operational area defined by the joint force commander for land and naval forces. Areas of operation do not typically encompass the entire operational area of the joint force commander, but should be large enough for component commanders to accomplish their missions and protect their forces. Also called **AO**. (JP 1-02)

battle damage assessment—The timely and accurate estimate of damage resulting from the application of military force, either lethal or non-lethal, against a predetermined objective. Battle damage assessment can be applied to the employment of all types of weapon systems (air, ground, naval, and special forces weapon systems) throughout the range of military operations. Battle damage assessment is primarily an intelligence responsibility with required inputs and coordination from the operators. Battle damage assessment is composed of physical damage assessment, functional damage assessment, and target system assessment. (JP 1-02) In Marine Corps usage, the timely and accurate estimate of the damage resulting from the application of military force. BDA estimates physical damage to a particular target, functional damage to that target, and the capability of the entire target system to continue its operations. Also called **BDA**. (MCRP 5-12C)

collection—Acquisition of information and the provision of this information to processing (JP 1-02) In Marine Corps usage, the gathering of intelligence data and information to satisfy the identified requirements. (MCRP 5-12C)

collection management—In intelligence usage, the process of converting intelligence requirements into collection requirements, establishing priorities, tasking or coordinating with appropriate collection sources or agencies, monitoring results and retasking, as required. (JP 1-02)

collection operations management—The authoritative direction, scheduling, and control of specific collection operations and associated

processing, exploitation, and reporting resources. Also called **COM**. (JP 1-02)

collection plan—A plan for collecting information from all available sources to meet intelligence requirements and for transforming those requirements into orders and requests to appropriate agencies. (JP 1-02)

collection requirement—An established intelligence need considered in the allocation of intelligence resources to fulfill the priority intelligence requirements and other intelligence needs of a commander. (This definition modifies the JP 1-02 entry and will be included in the next edition of MCRP 5-12C.)

collection requirements management—The authoritative development and control of collection, processing, exploitation, and/or reporting requirements that normally result in either direct tasking of assets over which the collection manager has authority, or the generation of tasking requests to collection management authorities at a higher, lower, or lateral echelon to accomplish the collection mission. Also called **CRM**. (JP 1-02)

combatant command—A unified or specified command with a broad continuing mission under a single commander established and so designated by the President, through the Secretary of Defense and with the advice and assistance of the Chairman of the Joint Chiefs of Staff. Combatant commands typically have geographic or functional responsibilities. (JP 1-02)

command and control—The exercise of authority and direction by a properly designated commander over assigned and attached forces in the accomplishment of the mission. Command and control functions are performed through an arrangement of personnel, equipment, communications, facilities, and procedures employed by a commander in planning, directing, coordinating, and controlling forces and operations in the accomplishment of the mission. (JP 1-02) Also in Marine Corps usage, the means by which a commander recognizes what needs to be done and sees to it that appropriate actions are taken. Also called **C2**. (MCRP 5-12C)

command element—The core element of a Marine air-ground task force (MAGTF) that is the headquarters. The command element (CE) is composed of the commander, general or executive and special staff sections, headquarters section, and requisite communications support, intelligence and reconnaissance forces, necessary to accomplish the MAGTF's mission. The CE provides command and control, intelligence, and other support essential for effective planning and execution of operations by the other elements of the MAGTF. The CE varies in size and composition and may contain other Service or foreign military forces assigned or attached to the MAGTF. Also called **CE.** (This definition modifies the JP 1-02 entry and will be included in the next edition of MCRP 5-12C.)

counterintelligence—1. Information gathered and activities conducted to protect against espionage, other intelligence activities, sabotage, or assassinations conducted by or on behalf of foreign governments or elements thereof, foreign organizations, or foreign persons, or international terrorist activities. (JP 1-02) 2. Within the Marine Corps, counterintelligence constitutes active and passive measures intended to deny a threat force valuable information about the friendly situation, to detect and neutralize hostile intelligence collection, and to deceive the enemy as to friendly capabilities and intentions. Also called **CI**. (MCRP 5-12C)

dissemination—Conveyance of intelligence to users in a suitable form. (JP 1-02)

dissemination management—Involves establishing dissemination priorities, selection of dissemination means, and monitoring the flow of intelligence throughout the command. The objective of dissemination management is to deliver the required intelligence to the appropriate user in proper form at the right time while ensuring that individual consumers and the dissemination

system are not overloaded attempting to move unneeded or irrelevant information. Dissemination management also provides for use of security controls which do not impede the timely delivery or subsequent use of intelligence while protecting intelligence sources and methods. (MCRP 5-12C)

force protection—Actions taken to prevent or mitigate hostile actions against Department of Defense personnel (to include family members), resources, facilities, and critical information. These actions conserve the force's fighting potential so it can be applied at the decisive time and place and incorporate the coordinated and synchronized offensive and defensive measures to enable the effective employment of the joint force while degrading opportunities for the enemy. Force protection does not include actions to defeat the enemy or protect against accidents, weather, or disease. (JP 1-02)

geographic intelligence—The process of collecting, organizing, analyzing, synthesizing, disseminating, and using all-source geospatial and other intelligence information with regard to the military aspects of the terrain in support of MAGTF operations. (MCWP 2-12.1)

human intelligence—A category of intelligence derived from information collected and provided by human sources. (JP1-02) In Marine Corps usage, human intelligence operations cover a wide range of activities encompassing reconnaissance patrols, aircrew reports and debriefs, debriefing of refugees, interrogations of prisoners of war, and the conduct of counterintelligence force protection source operations. Also called **HUMINT.** (MCRP 5-12C)

imagery intelligence—Intelligence derived from the exploitation of collection by visual photography, infrared sensors, lasers, electro-optics, and radar sensors such as synthetic aperture radar wherein images of objects are reproduced optically or electronically on film, electronic display devices, or other media. Also called **IMINT**. (JP 1-02)

indications and warning—Those intelligence activities intended to detect and report time-sensitive intelligence information on foreign developments that could involve a threat to the United States or allied and/or coalition military, political, or economic interests or to US citizens abroad. It includes forewarning of enemy actions or intentions; the imminence of hostilities; insurgency; nuclear or non-nuclear attack on the United States, its overseas forces, or allied and/or coalition nations; hostile reactions to US reconnaissance activities; terrorists' attacks; and other similar events. Also called **I&W**. (JP 1-02)

indications (intelligence)—Information in various degrees of evaluation, all of which bear on the intention of a potential enemy to adopt or reject a course of action. (JP 1-02)

indicator—In intelligence usage, an item of information which reflects the intention or capability of a potential enemy to adopt or reject a course of action. (JP 1-02)

intelligence—1. The product resulting from the collection, processing, integration, analysis, evaluation, and interpretation of available information concerning foreign countries or areas. 2. Information and knowledge about an adversary obtained through observation, investigation, analysis, or understanding. (JP 1-02) Also in Marine Corps usage, intelligence is knowledge about the enemy or the surrounding environment needed to support decisionmaking. This knowledge is the result of the collection, processing, exploitation, evaluation, integration, analysis, and interpretation of available information about the battlespace and threat. (MCRP 5-12C)

intelligence cycle—A six-step process by which information is converted into intelligence and made available to users. The six steps are planning and direction, collection, processing and exploitation, production, dissemination, and utilization. (MCWP 2-1) (This definition modifies the JP 1-02 entry and will be included in the next edition of MCRP 5-12C.)

intelligence preparation of the battlespace—An analytical methodology employed to reduce uncertainties concerning the enemy, environment, and terrain for all types of operations. Intelligence preparation of the battlespace builds an extensive database for each potential area in which a unit may be required to operate. The database is then analyzed in detail to determine the impact of the enemy, environment, and terrain on operations and presents it in graphic form. Intelligence preparation of the battlespace is a continuing process. (JP 1-02) In Marine Corps usage, the systematic, continuous process of analyzing the threat and environment in a specific geographic area. Also called **IPB**. (MCRP 5-12C)

intelligence report—A specific report of information, usually on a single item, made at any level of command in tactical operations and disseminated as rapidly as possible in keeping with the timeliness of the information. Also called **INTREP**. (JP 1-02)

intelligence requirement—1. Any subject, general or specific, upon which there is a need for the collection of information, or the production of intelligence. 2. A requirement for intelligence to fill a gap in the command's knowledge or understanding of the battlespace or threat forces. (JP 1-02) In Marine Corps usage, questions about the enemy and the environment, the answers to which a commander requires to make sound decisions. Also called **IR**. (MCRP 5-12C)

joint intelligence center—The intelligence center of the combatant command headquarters. The joint intelligence center is responsible for providing and producing the intelligence required to support the combatant commander and staff, components, subordinate joint forces and elements, and the national intelligence community. Also called **JIC**. (JP 1-02)

Marine air-ground task force—The Marine Corps principal organization for all missions across the range of military operations, composed of forces task-organized under a single commander capable of responding rapidly to a contingency anywhere in the world. The types of forces in the Marine air-ground task force (MAGTF) are functionally grouped into four core elements: a command element, an aviation combat element, a ground combat element, and a combat service support element. The four core elements are categories of forces, not formal commands. The basic structure of the MAGTF never varies, though the number, size, and type of Marine Corps units comprising each of its four elements will always be mission dependent. The flexibility of the organizational structure allows for one or more subordinate MAGTFs, other Service, and/or foreign military forces to be assigned or attached. Also called **MAGTF**. (This definition modifies the JP 1-02 entry and will be included in the next edition of MCRP 5-12C.)

Marine expeditionary force—The largest Marine air-ground task force (MAGTF) and the Marine Corps principal warfighting organization, particularly for larger crises or contingencies. It is task-organized around a permanent command element and normally contains one or more Marine divisions, Marine aircraft wings, and Marine force service support groups. The Marine expeditionary force is capable of missions across the range of military operations, including amphibious assault and sustained operations ashore in any environment. It can operate from a sea base, a land base, or both. It may also contain other Service or foreign military forces assigned or attached. Also called **MEF**. (This definition modifies the JP 1-02 entry and will be included in the next edition of MCRP 5-12C.)

measurement and signature intelligence—Scientific and technical intelligence obtained by quantitative and qualitative analysis of data (metric, angle, spatial, wavelength, time dependence, modulation, plasma, and hydromagnetic) derived from specific technical sensors for the purpose of identifying any distinctive features associated with the target, source emitter, or sender measurement of the same. The detected feature may be either reflected or emitted. Also called **MASINT**. (JP 1-02)

priority intelligence requirements—Those intelligence requirements for which a commander has an anticipated and stated priority in the task of planning and decisionmaking. (JP 1-02) In Marine Corps usage, an intelligence requirement associated with a decision that will critically affect the overall success of the command's mission. Also called **PIRs**. (MCRP 5-12C)

signals intelligence—1. A category of intelligence comprising either individually or in combination all communications intelligence, electronic intelligence, and foreign instrumentation signals intelligence, however transmitted. 2. Intelligence derived from communications, electronic, and foreign instrumentation signals. Also called **SIGINT**. (JP 1-02)

split base—Two or more portions of the same force conducting or supporting operations from separate physical locations. (MCRP 5-12C)

surveillance and reconnaissance cell—Primary element responsible for the supervision of MAGTF intelligence collection operations. Directs, coordinates, and monitors intelligence collection operations conducted by organic, attached, and direct support collection assets. Also called **SARC**. (Change approved for inclusion in the next version of MCRP 5-12C.)

validation—A process normally associated with the collection of intelligence that provides official status to an identified requirement and confirms that the requirement is appropriate for a given collector and has not been previously satisfied. (JP 1-02 part 1)

Air Force Doctrine Document 2-9
17 July 2007

This document complements related discussion found in Joint Publication 2-01, *Joint and National Intelligence Support to Military Operations*

BY ORDER OF THE
SECRETARY OF THE AIR FORCE

AIR FORCE DOCTRINE DOCUMENT 2-9
17July 2007

SUMMARY OF CHANGES

This document is substantially revised and must be completely reviewed. It updates the definition of intelligence, surveillance, and reconnaissance (ISR) to mirror the joint definition (Chapter 1). In an effort to refocus the document on operational-level doctrine, the ISR application section was deleted in its entirety, and more emphasis was placed on ISR principles by expanding this section to include the principles of persistence, global reach, and network centricity. Chapter 2 introduces predictive battlespace awareness and its association with the ISR process. The terms used to identify the ISR process are updated to match the joint process, with each step in the process expanded. The effects-based approach to operations and the ISR process are introduced. The section on unmanned or remotely piloted vehicles is updated to reflect new capabilities and expanded employment (Chapter 3). Tasking, processing, exploitation, and dissemination systems are introduced, as well as a discussion on alternative sources for surveillance and reconnaissance. Finally, the new structure for assessment is introduced and mirrors Air Force Doctrine Document 2-1.9, *Targeting*. Chapter 4 is completely revised to more clearly illustrate command relationships. A new section on the ISR division of the air and space operations center is provided to show the organization and its role. A new section that discusses intelligence authorities is provided. With the increased availability of surveillance and reconnaissance capable airborne platforms, a new section is provided to discuss the multi-role platform employment and sensor control.

FOREWORD

Intelligence, surveillance, and reconnaissance (ISR) functions from the air first date back to the use of balloons to observe the adversary during the French Revolution. One of the first missions for military aircraft was observation. Today, as in the past, we observe and analyze the meaning and impact of a wide variety of events and convey useful, timely intelligence on our adversaries' capabilities and intentions to our commanders.

Using doctrine as the foundation, the Air Force is following a transformational vision of networked and linked sensors that is shrinking the sensor-to-shooter cycle and is giving commanders greater situational awareness and better predictive intelligence necessary to achieve decision superiority and battlefield dominance. ISR technology provides us a clear advantage and no commander would want to reverse the direction the Air Force is following. However, our greatest ISR resource is our Airmen. In the best tradition of American ingenuity, our Airmen are constantly finding new and innovative uses for current and developing technology that give commanders a competitive advantage and enable them to create effects across the range of military operations. We have come a long way from the days of wondering what is going on just over the next hill, or half a world away. Through proper employment and integration of ISR capabilities, the Air Force will continue to provide decision makers at all levels of command the intelligence information needed to make policy, acquire capabilities, create strategy, conduct operations, and protect America from its adversaries.

INTRODUCTION

PURPOSE

This Air Force doctrine document (AFDD) establishes doctrinal guidance for fundamental principles and operational-level Air Force doctrine for intelligence, surveillance, and reconnaissance (ISR) and supports basic Air Force doctrine. It should be used to plan, prioritize, task, coordinate, and execute ISR operations.

APPLICATION

This AFDD applies to the Total Force: all Air Force military and civilian personnel, including active duty, Air Force Reserve Command, and Air National Guard units and members.

The doctrine in this document is authoritative, but not directive. Therefore, commanders need to consider the contents of this AFDD and the particular situation when accomplishing their missions. Airmen should read it, discuss it, and apply it.

SCOPE

Air Force intelligence, surveillance, and reconnaissance doctrine provides guidance for ISR participation in Air Force missions. A common doctrine, shared by all elements of a Service, helps ensure intelligence, surveillance, and reconnaissance organizations provide their commanders and forces with timely, accurate, and relevant information. Doctrine is a guide for the exercise of professional judgment rather than a set of inflexible rules. It describes our understanding of the best way to do the job. The doctrinal statements in this document are general—they are to be implemented through tactics, techniques, and procedures. These are articulated in unified and major command and field operating agency publications, as well as unit concepts of operations, operations plans, and other supporting documents.

FOUNDATIONAL DOCTRINE STATEMENTS

Foundational doctrine statements are the basic principles and beliefs upon which Air Force doctrine documents (AFDDs) are built. Other information in the AFDDs expands on or supports these statements.

- The goal of intelligence, surveillance, and reconnaissance (ISR) operations is to provide accurate, relevant, and timely intelligence to decision makers. The Air Force best achieves this goal through effective employment of ISR capabilities, and by capitalizing on the interoperability existing among our ISR systems, as well as non-traditional sources, to create synergy through integration. (Page 1)

- Air Force surveillance and reconnaissance assets are not inherently strategic, operational, or tactical in nature; they can be used to gather information to meet requirements at all levels of warfare. (Page 2)

- Intelligence products must enable strategic, operational, and tactical users to visualize the operational environment systematically, spatially, and temporally, allowing them to orient themselves to the current and predicted situation to enable decisive action. (Page 4)

- Planning and direction of ISR operations start with the identification of needs for intelligence regarding all aspects of the operational environment. (Page 9)

- The joint force air and space component commander (JFACC) typically serves as the supported commander for theater airborne and spaceborne reconnaissance and surveillance and provides integrated airborne ISR for the joint force commander (JFC). (Page 13)

- The JFC normally delegates operational control to the commander of Air Force forces or tactical control to the JFACC of airborne ISR assets who will task them to support combat operations via the air tasking order. (Page 40)

- The air and space operations center is the best facility to integrate the JFC's theaterwide airborne ISR capabilities, to include reachback and distributed operations ISR support. (Page 41)

- Mission objectives, priorities, and guidance for multi-role systems employment and the authority to task the weapon system must be clear and preferably worked out well in advance of mission execution. (Page 46)

CHAPTER ONE

INTELLIGENCE, SURVEILLANCE, AND RECONNAISSANCE (ISR) VALUE TO OPERATIONS

What enables the wise sovereign and the good general to strike and conquer, and achieve things beyond the reach of ordinary men, is foreknowledge.

—Sun Tzu
The Art of War

ISR DEFINED

Joint Publication (JP) 1-02, *Department of Defense Dictionary of Military and Associated Terms,* defines intelligence, surveillance, and reconnaissance as an activity that synchronizes and integrates the planning and operation of sensors, assets, processing, exploitation, and dissemination systems in direct support of current and future operations. This is an integrated intelligence and operations function.

The goal of ISR operations is to provide accurate, relevant, and timely intelligence to decision makers. The Air Force best achieves this goal through effective employment of ISR capabilities, and by capitalizing on the interoperability existing among our ISR systems, as well as non-traditional sources, to create synergy through integration. Synergy is defined as the interaction of individual parts so that the total effect produced by working together is greater than the sum of individual efforts. Together, ISR operations provide the commander the intelligence and situational awareness necessary to successfully plan and conduct operations.

ISR operations are a significant part of the overall goal of achieving decision superiority. Decision superiority is the competitive advantage, enabled by an ongoing situational awareness, that allows commanders and their forces to make better-informed decisions and implement them as fast and effectively as the situation warrants. Decision superiority is about improving our ability to observe, orient, decide, and act (OODA loop) faster and more effectively than the adversary. ISR is the life blood of effective decision making.

Intelligence, surveillance, and reconnaissance are often referred to as a collective whole, though the capabilities are distinctive and each fulfills a different purpose. These distinctive capabilities are defined below:

"Intelligence is the product resulting from the collection, processing, integration, analysis, evaluation, and interpretation of available information concerning foreign countries or areas; it is the information and knowledge about a topic obtained through observation, investigation, analysis, or understanding." (JP 1-02)

"Surveillance is the systematic observation of aerospace [sic], surface or subsurface areas, places, persons, or things, by visual, aural, electronic, photographic, or other means." (JP 1-02) The Air Force perspective emphasizes that surveillance operations are sustained operations designed to gather information by a collector, or series of collectors, having timely response and persistent observation capabilities, a long dwell time and clear continuous collection capability.

"Reconnaissance is a mission undertaken to obtain, by visual observation or other detection methods, information about the activities and resources of an enemy or potential enemy, or to secure data concerning the meteorological, hydrographic, or geographic characteristics of a particular area." (JP 1-02) The Air Force perspective emphasizes that reconnaissance operations are transitory in nature and generally designed to collect information for a specified time by a collector that does not dwell over the target or in the area.

The information derived from surveillance and reconnaissance, converted into intelligence by exploitation and analysis, is used to formulate strategy, policy, and military plans; to develop and conduct campaigns; guide acquisition of future capabilities; and to protect, prevent, and prevail against threats and aggression aimed at the US and its interests. **Air Force surveillance and reconnaissance assets are not inherently strategic, operational, or tactical in nature; they can be used to gather information to meet requirements at all levels of warfare.** ISR operations are conducted across the range of military operations from peace, to war, to conflict resolution. Combatant commanders typically employ assigned and attached forces through their J-2 staff for day-to-day management of ISR forces. When a joint task force (JTF) is created, the joint force commander (JFC) integrates the actions of assigned, attached, and supporting ISR forces within the operational area. Command and control (C2) of airborne ISR is usually delegated to the joint force air and space component commander (JFACC).

To be more specific, the JFC employs forces assigned or attached to the JTF to achieve campaign objectives. The JFC may retain operational control (OPCON) over airborne ISR assets or delegate it to the JFACC. The JFACC is in the best position to integrate space ISR assets through the air and space operations center (AOC). The JFC's staff develops an overall collection strategy and posture for the execution of the ISR mission. The JTF J-2 reviews, validates, and prioritizes all outstanding intelligence requirements, whether originating from the JTF J-2 staff or a component. The JFC

normally delegates OPCON or tactical control (TACON) of theater controlled, airborne ISR assets (except those organic to combat units) to the JFACC who will allocate them to support operations via the air tasking order (ATO).

STRATEGIC, OPERATIONAL, AND TACTICAL ISR

ISR supports strategic, operational, and tactical operations by providing intelligence and services to a diverse set of consumers, to include national agencies; geographic, functional, or Service components; and unit-level decision makers. Air Force ISR professionals provide valuable contributions at all levels of operations.

Strategic

Air Force ISR systems provide intelligence required at the strategic level to formulate national strategy, policy, and plans. The goal of strategic-level ISR is to provide accurate, timely, and predictive intelligence to enable decision makers to take appropriate actions before crises develop and to support the decision makers as crises unfold. Intelligence is also a key player in research and development, weapon system acquisition, force protection planning and programming, and other national-level programs.

Operational

Air Force ISR systems provide intelligence crucial to planning and executing theaterwide operations to accomplish the JFC's objectives. For example, campaign planners rely on ISR to provide the intelligence crucial to understanding an adversary's weaknesses and key nodes that can be affected by air, space, land, maritime, and information operations. Intelligence analysis helps detect/discover, identify, locate, and describe the vulnerable, vital elements of an adversary's physical and virtual structure and their centers of gravity (COG). Finally, ISR provides the means to assess the effects of current operations.

Tactical

ISR support at the tactical level of operations is primarily focused on tactical threat warning, mission planning, targeting, and assessment. Threat assessment, although performed at every level of military operations, is most common and critical at the tactical level. ISR tasks such as current assessment and defense penetration and warning are guided at the unit level by tailored tactics, techniques, and procedures. Required intelligence, such as target imagery, should be immediately available to support the ATO and mission planning cycle. Wing and squadron personnel also provide valuable information to the ISR process with annotated aircraft cockpit videos and reports based on aircraft sensors and aircrew debriefs. These inputs directly impact campaign assessment and reattack targeting decisions.

ISR PRINCIPLES

ISR operations provide intelligence information to commanders and decision makers at all levels, helping them reduce uncertainties in the decision-making process. It is precisely because intelligence supports all levels of policy, planning, and decision making that ISR is now presented in Air Force doctrine as a keystone publication (previously organized under information operations).

To be effective, ISR products must be responsive to the commander's or decision maker's needs. **Intelligence products must enable strategic, operational, and tactical users to better understand the operational environment systematically, spatially, and temporally, allowing them to orient themselves to the current and predicted situation to enable decisive action.** By adhering to the principles listed below, ISR personnel and systems can maximize intelligence support to consumers.

Integrated

Surveillance and reconnaissance operations and the intelligence process should be fully integrated to meet the timeliness and accuracy requirements of air, space, and cyberspace power. A close relationship between the ISR process and strategy, planning, and execution functions will foster the flow of essential information. The commander considers both the capabilities and limitations of ISR systems and organizations in the decision-making, planning, preparation, execution, and assessment processes. Similarly, as an essential element of all Air Force operations, ISR personnel should be fully aware of mission goals and objectives and integrated into the operational environment at all levels.

Accurate

To best support Air Force operations, ISR-derived products should be as accurate as possible. Accuracy implies reliability and precision. This requires corroboration and analysis of all available information. Extensive knowledge of adversary strategy, tactics, capabilities, and culture enables ISR personnel to anticipate actions and provide the most complete and exact picture possible to planners and operators. Accuracy also aids commanders in defeating adversary deception efforts. Geoposition accuracy is a crucial requirement for targeting, especially with the employment of precision-guided munitions. Sensors acquire information that enables targeteers to produce target locations or aim points suitable for the accurate employment of specific weapon systems. Lastly, one of the most demanding tasks for ISR personnel during emerging crises is the need to balance requirements for accuracy with timeliness (defined below). Judging the appropriate balance between accuracy and expediency requires very close coordination with operations planners.

Relevant

Relevance in ISR means the ISR product is tailored to the requestor's needs. Intelligence and collection requirements should directly apply to determining, planning, conducting, and evaluating operations. Intelligence should focus on the commander's potential, planned, and ongoing courses of action. Ensuring the relevance of intelligence to the requestor means that ISR planners should consider the suitability of specific surveillance and reconnaissance assets to achieve the commander's objectives. Planning the employment of surveillance and reconnaissance assets is based on an asset's capability and its suitability, within the context of the overall collection plan, to meet user requirements. Suitability also applies to the format of the processed intelligence. Both the information and the format should be useful to the user.

Timely

ISR products should be available in time to plan and execute operations as required. This principle applies to identifying and stating requirements, collecting information, and producing actionable intelligence. Timely intelligence is essential to prevent the use of surprise by the adversary, conduct defense, seize the initiative, and use forces effectively. The dynamic nature of ISR can provide information to aid in a commander's decision-making cycle and constantly improve the commander's view of the operational environment. The responsive nature of Air Force surveillance and reconnaissance assets is an essential enabler of timeliness if Air Force assets are made available to collect information when and where required. Collected information is disseminated to the appropriate processing agency or user based on established collection or reporting requirements. As technology evolves, every effort should be made to streamline and automate processes to reduce timelines from tasking through product dissemination. However, since surveillance and reconnaissance assets are limited, responsiveness is often driven by the commander's objectives and priorities. Commanders must ensure proper asset utilization based on the range of missions. Finally, ensuring communications connectivity throughout the ISR "system" is key to delivering timely intelligence to consumers.

Fused

ISR-derived information from many sources is combined, evaluated, and analyzed to produce accurate intelligence. This process is called fusion. Fusion helps defeat adversary efforts to deny information. Intelligence personnel use fusion analysis to increase assessment accuracy and counter adversary denial and deception efforts. Analysts fuse intelligence by considering as many types of target signatures and indicators collected over time as practical. Considering intelligence from multiple collection systems (preferably from different disciplines) over time may reveal activity concealed from a single sensor or discipline. Fusing multiple sources with historic trends and previous assessments enables analysts to generate a more complete and accurate assessment of the operational environment. However, care should be taken not to promote fusion at the expense of timeliness. For example, significant single-source information that relates directly to a current or planned operation, such as a

previously undetected surface-to-air missile site near the target or a credible report of an imminent airfield attack, should be sent to users immediately.

Accessible

ISR-derived information must be readily accessible to be usable. First, intelligence should be easily retrievable; ISR personnel should be able to "get at the information" before they can disseminate, process, exploit, or analyze it. Second, both ISR personnel and the consumer should have the appropriate clearances to access and use the information. Third, ISR products should always be classified at the lowest possible classification consistent with security. Understandably, some intelligence requires extraordinary protection such as sensitive sources and methods or the fact that certain knowledge is held.

Secure

Personnel working with classified material must protect the information and sensitive sources while still managing to keep commanders and their staffs fully informed. Protection of classified information and sources must be consistent with established Department of Defense (DOD) policies and procedures, even if operations are conducted with coalition partners. The difference between peacetime and contingency policies and priorities should be determined ahead of time and be well understood. Criteria, authority, and procedures for declassifying or sanitizing intelligence should be available at appropriate levels and tested during selected exercises. Classification authorities should avoid overclassification and unnecessary compartmentalization that can prevent commanders and staff from accessing needed intelligence. If directives are too restrictive to meet current operational requirements, additional guidance or authorization from the appropriate classification authority should be requested.

Survivable, Sustainable, and Deployable

ISR resources, activities, and communications should be survivable to ensure support is available when needed. Important components of survivability include redundancy of critical intelligence, protection against the adversary's asymmetrical threats, information assurance measures, and hardening of communications capabilities. Therefore, commanders should develop concepts of ISR operations that provide for continuity even if communications are severely stressed or lost. Sustainability is vital for all surveillance and reconnaissance systems. A system's ability to maintain the necessary level and duration of operations depends on ready forces and resources in sufficient quantities to support stated requirements. Deployability has to be built into systems. With the exception of aircraft and space-based ISR platforms, most ISR assets are rugged, small, and lightweight. They should be easy to transport and set up and capable of immediate connectivity and interoperability. Finally, from a macro view, ISR-derived intelligence is a large part of the support that goes into the survivability and sustainability of every weapon system acquired and maintained by the Air Force.

Unified Effort

Organizations at all levels should have clearly defined functions that minimize duplication, maximize sharing of information among Services agencies and allies, and are mutually supportive. Unity of effort requires a focus on joint and allied forces' ISR requirements and production. These potential requirements and the support they need should be agreed upon and tested in advance of operations. Finally, collaboration among operators, targeteers, analysts and specialists result in synchronized, efficient target development and assessment.

Persistent and Global Reach

Commanders require the ability to achieve on-demand reconnaissance and persistent surveillance throughout the operational environment. Modern collection requirements are increasingly focused on fleeting, dispersed targets that present a markedly different signature from industrial-age targets such as large military formations and complex industrial facilities. Commanders should, therefore, consider, plan for and ensure diplomatic arrangements are in place for immediate deployment and employment of ISR assets that must overfly sovereign nations en route to targets. To deny enemy sanctuaries of movement, Air Force ISR capabilities focus detailed collection against broad target areas for long periods of

Battle of Fallujah

Although Air Force reconnaissance planes had been circling over Fallujah, the Marines surrounding the Iraqi city could not view what the sensors on the Air Force MQ-1 Predators and C-130E/H Scathe View were seeing. Then, a tactical air control party showed up with the first laptop computer and antenna ROVER II (Remote Operations Video Enhanced Receiver) system. On the laptop's screen appeared the video image downlinked by a circling Predator. This direct support of actionable imagery to the tactical user was invaluable and has saved many lives. In another example, Airmen and Soldiers at Balad Air Base, Iraq, used ROVER to help direct a Predator scouting for insurgents launching mortar attacks on the base. On 11 April 2004, the night after a fatal mortar attack on the base, a Predator spotted two mortars being fired at the base. Before a third round was launched, the unmanned aircraft (UA) crew in close coordination with ground units using ROVER, scored a direct hit on the insurgents. With urban close air support a growing concern, ROVER technology is a valuable tool for warfighters on the ground and aircrews to see the same operating picture without being in harm's way.

time, either through long-dwell sensors or a combination of more numerous short-dwell collectors. Commanders defeat denial strategies and create ISR reach throughout the operational environment through a combination of space-based sensors, remotely piloted systems, and tactically survivable platforms. The combination of persistence and reach complicates enemy planning and reduces enemy choices while creating options for commanders.

Network Centric

Network centricity is a key principle for all Air Force ISR efforts. It is the natural progression of technology and employment that aids in the efficient exchange of actionable information to operators at all levels. Net-centric ISR capabilities, designed from the ground up to plug into a secure global information network that extends out to the tactical edge, provide users tailored information and actionable intelligence that increase situational awareness and foster the capacity to conduct operations more flexibly and rapidly. Networking will enable information derived from a wide variety of sensors on shooters, battle management assets, and dedicated intelligence systems to be directly available to any networked warfighter (i.e., sensor-to-shooter). This capability will also create a high fidelity fused common operational picture which is the cornerstone of battlespace awareness dominance. Net-centric collaborative environments support creation of "virtual organizations" where personnel from numerous agencies around the world horizontally align as a team, quickly focus analytic effort on a problem, and deliver a solution or recommended course of action for employment under the C2 of a vertically aligned organizational construct. Often transparent to the commander of Air Force forces (COMAFFOR), such collaborative efforts (often spontaneous) should be encouraged to make the most efficient use of available resources.

Through net-centric operations, a wide variety of detailed sensor data can be posted to compatible, joint intelligence information stores, and continually searched in order to cross-cue and refine collection operations. Intelligence analysts combine, evaluate, and analyze collected information from a variety of sources in a collaborative environment, then provide fused products for use by decision makers. Combining multiple resources in a variety of spectra works to defeat enemy concealment, denial, and deception strategies. Strategic, operational, and tactical users employ tailored searches to gain access to the right information at the right time to support operations. Ideally, both C2 and ISR planning systems access common databases to synchronize collection and operations requirements. Network-centric ISR capabilities contribute to achieving information superiority.

CHAPTER TWO

THE ISR PROCESS

> *True genius resides in the capacity for the evaluation of uncertain, hazardous, and conflicting information.*
>
> ***—Winston Churchill***

The ISR process is comprised of a wide variety of intelligence operations: planning and direction; collection, processing and exploitation; analysis and production; dissemination and integration; and evaluation and feedback. It should focus on the commander's mission and concept of operations. The process is not a linear or even cyclic operation, but rather represents a network of interrelated, simultaneous operations that can, at any given time, be fed by and feed other intelligence operations. The output of the overall process is actionable intelligence—timely, accurate, and complete—that supports decision making at all levels of war.

PLANNING AND DIRECTION

Planning and direction of ISR operations start with the identification of needs for intelligence regarding all aspects of the operational environment. The President and Secretary of Defense direct JFCs to engage in adaptive planning for the conduct of operations. The JFC should provide the commander's critical information requirements (CCIRs) to the joint staff and components. CCIRs comprise a comprehensive list of information requirements identified by the commander as being critical to facilitating timely information management and the decision-making process. There are numerous legal issues associated with ISR, especially if it could impact US citizens. ISR activities should be coordinated with the servicing judge advocate general (JAG) to ensure compliance with the law and any existing rules of engagement (ROE).

Intelligence preparation of the operational environment (IPOE) alerts decision makers at all echelons of command to emerging situations and threats. JFC guidance provided during planning shapes the overall concept of operations, which in turn drives requirements for air and space strategy. The JFACC's challenge is determining where and when to focus attention in order to influence events early, ready forces, and begin setting conditions for future operations. Therefore, preparation of the operational environment is essential to supporting the commander's visualization process, determining (component-level) CCIRs, anticipating critical decision points during operations, and prescribing ROE. IPOE and target development processes identify and assess the adversary's COGs, key capabilities and vulnerabilities, intentions, and potential courses of action (COAs). By identifying known adversary capabilities, IPOE provides the conceptual basis for the JFACC to visualize how the adversary might threaten the command or interfere with mission accomplishment. By identifying specific adversary COAs and COGs, IPOE provides the basis for friendly and adversary COA comparisons, often referred to as wargaming sessions, in which the staff "fights" each

friendly and adversary COA. This wargaming process assists intelligence and operations in identifying specific indicators that could confirm or deny a given adversary COA or are otherwise required to support a friendly COA

Using knowledge gained via intelligence analysis (IPOE and target development) and the wargaming process, commanders can anticipate when and where action will occur, enabling them to focus on broad friendly, hostile, and neutral force interactions to determine the most effective way to apply Air Force capabilities to achieve desired effects. With this foundation, an optimal ISR strategy designed to sequence ISR operations is derived. ISR strategy is encapsulated in the joint air operations plan (JAOP) and is synchronized with theater and national ISR architectures and strategy. It provides the foundation for development and validation of intelligence requirements, captures the framework for planning and direction of ISR operations, and establishes guidance for the operation of all other elements of the ISR process. Anticipating where and when important events will take place provides a framework in which to orchestrate national, theater, and tactical assets to focus surveillance on specific target elements and guide decisions on how, when, and where to engage adversary forces to achieve the JFC's objectives.

Requirements for intelligence to support operations are identified by the commander and the staff. In the course of intelligence planning and direction, intelligence planners identify the intelligence required to answer the CCIRs. Those intelligence requirements deemed most important to mission

Predictive Battlespace Awareness

Predictive battlespace awareness (PBA) influences all elements of the intelligence process. PBA is a multidimensional understanding of the battlespace in time, space, and effect. It is the capability to correlate and fuse patterns of enemy activity and subsequent events to predict adversary intent or potential future enemy courses of action. PBA is continuous and achieved by the commander through possession of relevant, comprehensive knowledge, including an accurate forecast of pertinent influences in the battlespace. This knowledge of the operational environment, in concert with C2, permits commanders to anticipate future conditions, assess changing conditions, establish priorities, and exploit emerging opportunities. Our ability to act with a degree of speed and certainty not matched by our adversaries permits commanders to shape the battlespace to our advantage.

To achieve this level of awareness requires the development of five key elements: intelligence preparation of the operational environment, target development, ISR strategy and planning, ISR employment, and assessment. These elements are continuously refined, in parallel, to provide a comprehensive view of the battlespace which provides commanders with the capability to anticipate future conditions, assess changing conditions, establish priorities, and exploit emerging opportunities while mitigating the impact of unexpected adversary actions.

accomplishment are identified as priority intelligence requirements (PIRs). PIRs are general statements of intelligence need, such as "what is the operational status of the adversary's integrated air defense system?" or "what terrorist groups are active within the area of responsibility/interest (AOR/AOI)?" They provide the framework for prioritization of all ISR operations. PIRs are driven by, and in turn drive, the IPOE process to refine information requirements and support the commander's potential courses of action. The PIRs drive the development of detailed essential elements of information (EEIs). The designation of intelligence requirements helps ensure ISR efforts are focused on the most critical information needed to support warfighters in addition to Air Force acquisition efforts and defense policy-making. The EEIs define intelligence consumers' specific information requirements. A sample EEI would be, "what is the current location of the adversary SA-20 battery?" EEIs are linked to PIRs in order to maintain traceability for all ISR operations back to commander priorities. Over time, as new direction and guidance evolve, ISR planners will develop new requirements or modify existing requirements.

Information requirements should be validated before collectors can be tasked to fill the requirement. ISR requirements are validated by theater collection management authorities embedded in the JFC's staff. Theater collection managers will typically answer the following questions before validating an information requirement: Does the information requirement meet the commander's concept of operations? Has the information already been acquired but not distributed to the requester? Are there other ongoing operations that might satisfy the requirement? If any of these conditions is met, new ISR collection missions may not be necessary. Once validated, an information requirement becomes a collection requirement and the ISR planning process begins. The process for developing and validating ISR collection requirements is essentially the same during peacetime, crisis, and war—only the nature of the requirements and the timeliness in which they should be satisfied varies. Though the process remains the same across the range of military operations, carefully crafted intelligence requirements are essential in an effects-based approach to operations.

An effects-based approach to operations (EBAO) is one in which operations are planned, executed, assessed, and adapted to influence or change systems or capabilities in order to achieve desired results. EBAO seeks to understand and exploit the complex connections among individual actions, the effects—direct and indirect—that those actions produce, how those effects influence the states and behaviors of complex systems in the operating environment, and how these effects contribute to the accomplishment of desired outcomes. Under an effects-based approach, IPOE and target development products will enable the entire process. Throughout the intelligence process, refinement of information requirements should continuously evaluate whether or not the intelligence provided will satisfy the needs of planning, employment, and assessment. Since EBAO starts with desired outcomes (the end state, objectives and related effects), requests for information should be tailored to ensure the desired effects can be measured—something that is not always easily anticipated or quantified depending upon the capability employed. Assessment of operations will include all efforts to evaluate performance (measures of performance [MOPs]) and progress

toward effects and objectives (measures of effectiveness [MOEs]). Assessment also seeks to anticipate outcomes and answer both questions "are we doing things right (MOPs)," and "where do we go from here?" Assessment requires stringent adherence to apportionment and allocation procedures when employing ISR assets to ensure the correct measurement of the obtained effect. (See AFDD 2, *Operations and Organization*, and AFDD 2-1.9, *Targeting,* for more on the effects-based approach and assessment.)

The process of planning ISR operations begins once requirements have been established, validated, and prioritized. As intelligence collection requirements are aligned with available collection capabilities, the planning process addresses factors such as the availability of ISR assets, platform and sensor capabilities, adversary threats to ISR assets, and timeliness of the ISR response. These factors, when weighed together, affect how ISR assets are tasked and employed. In order to make the planning process more efficient, information requesters should clearly articulate their collection requirements and allow the collection managers and operations planners to decide the best way to meet the requirements. ISR operations planners at every level should coordinate closely with each other to effectively plan ISR operations. ISR planners should thoroughly analyze the combination of the commander's objectives and guidance, potential threats, force capabilities, and ISR systems availability.

Collection managers should first coordinate with operations planners to determine if organic ISR assets are capable of satisfying the requirement. If organic assets are available, then the appropriate unit will be tasked by the proper authority who exercises OPCON or TACON over the collection asset. If organic assets are not available to satisfy the request then the request is forwarded to a higher echelon for consideration.

- At the national level, the Defense Intelligence Agency (DIA), Central Intelligence Agency (CIA), National Security Agency (NSA), and the National Geospatial-Intelligence Agency (NGA) conduct long-range ISR planning and form intelligence task forces in response to crises. These agencies may also augment joint force ISR staffs with joint staff-directed national intelligence support teams (NIST) if requested. These teams, in addition to other duties, help focus ISR planning and collection requirements and provide an additional conduit for two-way communication between theater and national-level ISR collection management efforts.

- At the theater or joint force level, the JFC will provide collection, processing, exploitation, production, and dissemination capabilities. The JFC also establishes priorities for ISR operations that align with national and theater objectives. Further, the JFC's staff produces theater plans, such as the operations plans (OPLAN) and concept plans (CONPLAN), and tailors theater ISR assets to meet crisis requirements. Lower echelon collection requirements are often passed to theater collection managers where the redundant requirements are deconflicted. For peacetime, contingency, and wartime operations without an established JTF, the theater collection managers and operations planners coordinate their efforts in the ISR planning process. If a JTF is established, the JFC's collection managers and

operations planners coordinate their efforts with AOC collection managers and operations planners. The results of these efforts are included in the ATO and other tasking mechanisms as they are developed. The JFC's staff is responsible for development of a federated architecture for intelligence exploitation and analysis, leveraging the support of organic capabilities at the component and JTF level, other combatant commanders, and national agencies to ensure complete coverage of all exploitation and analysis requirements. Finally, in conjunction with functional and service components and coalition partners, the JFC will request ISR capabilities (personnel, platforms, etc.) to support current and planned requirements that exceed on-hand capabilities.

- At the operational level, **the JFACC typically serves as the supported commander for theater airborne and spaceborne reconnaissance and surveillance and provides integrated airborne ISR for the JFC.** If no JFACC is appointed, the COMAFFOR should normally serve as the supported commander for theater Air Force airborne and spaceborne reconnaissance and surveillance. At the operational level, the process of planning and directing ISR operations includes identifying and validating the need for ISR missions, and if a need is determined, prioritizing the missions. At this level, ISR planners consider the tradeoffs of survivability, weather effects, and information acquisition. For example, if land operations are of primary concern, the COMAFFOR/JFACC will position airborne ISR assets to ensure they provide the best possible support to ground operations. However, if the adversary poses a significant threat to these assets, the COMAFFOR/JFACC may need to disperse or reposition assets to improve their survivability. If organic ISR assets are not available, then alternative arrangements should be developed with outside supporting agencies to satisfy the information requirement.

COLLECTION

The collection portion of the intelligence process involves tasking appropriate collection assets or resources to acquire the data and information required to accomplish collection tasking. Collection includes the identification, coordination, and positioning of assets or resources to satisfy intelligence requirements.

Collection managers develop collection plans based on the validated intelligence requirements of commanders and decision makers. The collection manager's task is to first verify the requirements have been validated. Once verified, the collection manager:

- Develops and manages a collection plan that integrates requirements with target characteristics.

- Determines the capabilities and limitations of the available organic collection assets and compares them to the collection plan.

- Develops a collection strategy to optimize the effective and efficient use of all available, capable, and suitable collection assets and resources.

- ✪ Identifies collection requirements that cannot be met by organic assets and forwards them up the chain of command for validation and tasking of non-organic intelligence resources.

- ✪ Directs processing and dissemination of collected data. Collection managers should understand the capabilities and limitations of each discipline and the procedures for ensuring target coverage by the appropriate collection asset and/or resource. Collection managers keep requesters informed of collection status and capabilities so there are realistic expectations of what can be collected and what level of confidence can be placed in the information.

The key to the collection manager's job is selection of the right combination of collection assets for a particular information requirement. Collection managers should focus on a multidisciplinary approach to collection tasking. Collection capabilities complement each other, and the collection manager should resist favoring or becoming too reliant on a particular sensor, source, system, or technique. Each system's limitations can be mitigated through the capabilities of the others, as different systems provide additional insights into the requirement. While a sensor, source, or system may seem to be an obvious choice to satisfy a requirement, flexibility is the key. Collection managers should match collection resources to the type of adversary activity most likely to be captured by collection operations. Rigid dependence on a single source may result in mission failure, especially if that source becomes unavailable or if the adversary takes measures to counter it. Lack of a multidisciplinary approach may also result in discernible patterns that may play into the adversary's counterintelligence or denial and deception efforts.

Collection managers should seek to maximize the use of existing collections. This requires full access to national databases. Collection managers should look first to organic assets as the primary choice for collection tasking. Use of organic collection assets allows a timely and tailored response to collection requirements and serves to lessen the burden on collection resources controlled by other units, agencies, and organizations. However, if requirements cannot be satisfied by organic assets, the collection manager should not hesitate to request collection support from higher, adjacent, and subordinate units, agencies, and organizations. Each echelon in the collection management architecture has specific capabilities and responsibilities:

- ✪ At the strategic level, DIA coordinates requirements through NGA, National Reconnaissance Office (NRO) and NSA for tasking of national reconnaissance systems, manages the DOD human intelligence (HUMINT) program, coordinates with the intelligence community on other collection programs, and responds to requests for information (RFIs) submitted by theater intelligence centers.

- ✪ At the theater level, the geographic combatant commander (CCDR) exercises collection management authority (CMA) for collection operations in his theater. CMA involves two complementary functions: collection requirements management (CRM), defining what intelligence systems should collect; and collection operations management (COM), specifying how to satisfy the requirement. CRM focuses on

the requirements of the customer, is all-source oriented, and advocates what information is necessary for collection. COM focuses on the selection of the specific intelligence discipline(s) and specific systems within a discipline to collect information addressing the customer's requirement. For specified operations, the JFC will normally retain CRM responsibilities and delegate the responsibility for COM for the joint operations area (JOA) to the COMAFFOR or JFACC as supported commander for theater ISR.

- At the operational level, for peacetime operations, ISR managers communicate the COMAFFOR's or JFACC's tasking through scheduling messages and assembling a prioritized list of collection objectives for sensor use. During contingency operations and wartime, the JFACC tasks airborne and spaceborne platforms through the ATO and ISR managers assemble a prioritized list of collection objectives for sensor use. Specific collection tasking is captured in the reconnaissance, surveillance, and target acquisition (RSTA) annex to the ATO, guided by the ISR strategy developed during the JAOP process.

- Increasingly, airborne ISR capabilities rely on multiple units to execute the mission. For example, a Predator flown by a reconnaissance squadron provides data for exploitation to a distributed common ground system (DCGS) unit. For ground-based systems, like special operations forces (SOF) or HUMINT, the responsibility lies with the competent authority at the tactical level. In all cases, tactical-level commanders should evaluate the risks (threat, tactics, weather, safety, and logistics, for example) involved to complete the mission successfully. The COMAFFOR or JFACC is the final authority on determining whether the benefits of successfully accomplishing the mission outweigh the risks involved for those forces and assets over which he exercises OPCON or TACON. However, the executing tactical commander normally provides inputs concerning these risks during the decision-making process.

- Collection management is not just a pre-mission function. Assets may also be tasked while the mission is ongoing. Changing situations may require that ISR assets be dynamically retasked from their preplanned mission to support new mission requirements. The capabilities of the asset being retasked will determine the success of the reassigned mission. For example, ISR assets with long loiter times or frequent revisit rates generally have the flexibility to respond to dynamic retasking. Dynamic retasking occurs when the requester identifies a time-sensitive need after the appropriate ISR asset has already been tasked. Dynamic retasking does not necessarily imply that a track or an ISR mission must be changed; rather it means that a higher priority collection requirement has emerged that an active platform may have the capability to collect. However, the same asset may not have the right sensor configuration to successfully accomplish the new tasking. Thus, commanders should carefully consider the advantages and disadvantages before deciding to retask assets executing their pre-planned mission. The parameters under which dynamic tasking takes place are a part of ISR strategy development, and are documented in the JAOP and RSTA annex.

PROCESSING AND EXPLOITATION

Once the data satisfying the requirements are collected, they undergo processing and exploitation. Through processing and exploitation, the collected raw data are transformed into information that can be readily disseminated, used, transmitted, and exploited by intelligence analysts to produce multidisciplinary intelligence products. Relevant critical information should also be disseminated to the commander and joint force staff to facilitate time-sensitive decision making. Processing and exploitation time varies depending on the characteristics of specific collection assets. For example, some ISR systems accomplish processing and exploitation automatically and nearly simultaneous with collection, while other collection assets, such as HUMINT teams, may require substantially more time. Processing and exploitation requirements are prioritized and synchronized with the commander's PIRs.

During processing and exploitation, collected data are correlated and converted into a format suitable for subsequent analysis and production of intelligence. Processing remains distinct from analysis and production in that the resulting information receives only a cursory analysis for time-critical exploitation and has not yet been subjected to full analytical assessment. Relevant time-sensitive information resulting from this step in the process (especially targeting, personnel recovery, or threat warning information) should be immediately disseminated through intelligence broadcasts, secure information workspace or internet relay chat channels, imagery product libraries (IPLs), intelligence databases, or message reporting. Additionally, some information is suitable in its raw form to meet user requirements. For example, joint terminal attack controllers (JTACs) can receive a direct feed via ROVER from a Predator or other full-motion video collection source to provide an invaluable "over the next hill" look to support close air support operations. Raw information should be made available to users with the capability to receive it, the knowledge to understand the information they are receiving, and the authority to take action on it.

IPOE provides a disciplined and dynamic framework for processing and exploiting large amounts of data. The knowledge gained as a result of comprehensive IPOE and target development, as well as our capability to anticipate adversary actions, depend on our ability to leverage and fuse all available information. Processing and exploitation architectures should take advantage of network centricity to enable the first part of intelligence fusion—the correlation of multiple source collection into a single, fused report of the operational environment activity. IPOE enables operators and intelligence analysts alike to remain focused on the most critical aspects of the operational environment and adversary. Incoming information and reports can be rapidly incorporated into critical decision-making processes and provide a convenient medium for displaying the most up-to-date information and for identifying critical information gaps.

ANALYSIS AND PRODUCTION

Information is converted into intelligence products through analysis and production, a structured series of actions which, although planned or usually occurring sequentially, may also take place concurrently. These actions include the integration, evaluation, analysis, and interpretation of information in response to known or anticipated intelligence production requirements.

- **Integration.** Information from single or multiple sources is received, collated, and entered into appropriate databases by the analysis and production elements of intelligence community organizations, the theater joint intelligence centers or equivalents, or subordinate joint force elements like the ISR division. Information is integrated and grouped with related pieces of information according to predetermined criteria to facilitate the evaluation of newly received information.

- **Evaluation.** Each new item of information is evaluated by the appropriate analysis and production element with respect to the reliability of the source and the credibility of the information. The reliability of the source and the credibility of the information should be assessed independently of each other to avoid the possibility of one factor evaluation biasing the other.

- **Analysis.** During analysis, deductions are made by comparing integrated and evaluated information with known facts and predetermined assumptions. These deductions are combined and assessed to discern patterns, links or recognized events.

- **Interpretation.** Interpretation is an objective mental process in which the significance of information is judged in relation to the current body of knowledge, covering both adversary and friendly forces, and existing information and intelligence. This mental process involves the identification of new activity and a postulation regarding the significance of that activity.

Taken together, these actions enable intelligence fusion—the synthesis of multiple event reports into an assessment of the nature of ongoing operational environment activity; the extrapolation of all operational environment activity into a predictive assessment of future activities; and the shaping of ongoing ISR operations to refine these assessments. To enable this level of fusion, analysts should work in collaborative environments which provide access to recognized, and often geographically separated, subject matter experts. Through collaboration, intelligence analysts are able to share information, discuss opinions, debate hypotheses, and identify or resolve analytic disagreements. Net-centric connectivity and access greatly enhance an analyst's ability to share, compare, and assess information. Intelligence analysis organizations at all echelons make unique contributions to analysis and production.

- At the strategic level, the joint staff director of intelligence (JS/J2) provides analytic estimates, reports on adversary capabilities, and activates an interagency

Circular Reporting
During Bosnia Operations

Several times during Operations PROVIDE PROMISE and DENY FLIGHT, (US operations in Bosnia) information collected from US sources was passed to NATO officials, who later reported the information back into the US intelligence system. The same thing happened in reverse. This "circular reporting" was especially true of air defense radar indications.

On occasion, intelligence officers were led to believe that there were more SAM radars active than there really were, and it took time to deconflict apparently different reports about seemingly distinct radar sites.

SA–6 GAINFUL SAM

F–16 FIGHTING FALCON

assessment cell to directly support targeting missions. In cases in which the JS/J2 needs additional expertise or resources, the JS/J2 requests assistance from the DIA.

- At the theater or joint force level, the JFC staff provides theater assessments, maintains databases, produces some target materials for operating forces in an area of responsibility (AOR), acts as overall battle damage assessment (BDA) validation authority, and supports the J–3 in the assessment process. Joint force J–2s maintain knowledge of adversary and terrain, conduct target development and nomination, and report operational BDA.

- At the operational and tactical level, intelligence personnel update databases; perform target analysis, development, and nomination; produce target materials; and report tactical and operational assessment. Intelligence personnel, through reachback and distributed operations, provide air and space-related intelligence and information operations analytical products and services unavailable in the theater or through the normal chain of command.

Additionally, analysts should have access to intelligence databases—repositories of collected data, processed information, and finished intelligence products which provide analysts with the technological means to rapidly retrieve, sort, and correlate

relevant information. Intelligence databases are usually designed to support specific requirements and functions, and are therefore often "stovepiped" according to intelligence disciplines. For example the NGA national exploitation system is a repository for imagery analysis and production, and the signals intelligence (SIGINT) on-line information system contains current and historical finished SIGINT products. The "stovepiping" of information by intelligence discipline or production category limits the potential timeliness and quality of intelligence production, as analysts are forced to search multiple databases for relevant information. Furthermore, as databases grow in volume and complexity, potentially vital pieces of information may become increasingly difficult for analysts to find and retrieve. In order to overcome this limitation, virtual knowledge bases have been designed to serve as integrated repositories of multiple databases as well as reference documents and open-source material.

Battlespace awareness products provide the foundation for the commander's estimate process as well as a baseline for long-term analysis essential to understanding the multidimensional aspects of the operating environment. The daily demand to support immediate decision-making needs often exceeds existing analytic capabilities, particularly in the forward area. Resources, therefore, should be carefully allocated and made available for the long-term analysis required to sustain operations. The necessary degree of predictive awareness can only be achieved through full participation of our joint, interagency, and multinational/coalition partners in a collaborative environment linking all command echelons and coordinating different functional nodes (e.g., reachback to analytic centers of excellence). In addition, every level of command should define and document the information it requires to build battlespace awareness, creating a deliberate information flow that is responsive to the commander's requirements.

DISSEMINATION AND INTEGRATION

Dissemination of ISR products continues the process by giving the user information required for application in a timely manner. Dissemination may take the form of electronic transmission, hardcopy annotated imagery or maps, direct threat warnings, oral and written reports, or briefings. The dissemination process requires continuous management. Without effective management, communications paths can become saturated by information from single sources being retransmitted by many intermediate collection agencies, resulting in "circular reporting." Advances in technology are also affecting dissemination. Computers and modern communication systems have reduced the information–to–production timeline for delivering ISR products. Likewise, some collection systems are capable of disseminating collected information to requesters on a real- or near real-time basis, vastly increasing their responsiveness. This is especially important for those collection operations supporting ongoing military operations in which the situation may be evolving rapidly and perishable information may lose its usefulness within a matter of minutes or seconds. Implementing new "information profiles" technologies and capabilities puts power in the hands of the warfighter to obtain only pertinent information exactly when and where it is needed. Ancillary to the discussion of classified information dissemination is the need

to expedite dissemination of declassified information. Commercial technology that enables continuous live media coverage of military operations may require expedited declassification and public dissemination of intelligence products in order to counter enemy propaganda or support other operational objectives. ISR planning should include local procedures for rapidly coordinating public release of select intelligence.

This expanding collection capability makes network centricity all the more important because real-time planning and targeting systems depend on tailored intelligence information. Requesters integrate the intelligence into their decision-making and planning processes, and technical barriers to rapid integration, such as system incompatibility or security barricades, complicate operations. Information superiority requires the timely integration of intelligence with operations in an easily understood format that facilitates decision-making at all levels while at the same time maximizing the amount of relevant information available. In the case of threat warning alerts essential to the preservation of life and/or vital resources, such information should be immediately communicated directly to and acknowledged by those forces, platforms, or personnel identified at risk so the appropriate responsive action can be taken. More generally, the integration of intelligence and operations on a continuous basis allows commanders and all operational planners access to the most current information available, thereby optimizing intelligence support to operation planning, preparation, execution, and assessment functions.

The primary vehicle for integrating intelligence and operations is the common operational picture (COP). Intelligence should be disseminated in such a manner that it can be automatically rendered or visualized in the COP and facilitate a shared operations/intelligence view of the operational environment. The COP is a broad merging of inputs from a wide variety of tactical, operational, and national sources into a single picture that serves a broad set of users for multiple purposes. Wide area surveillance radar systems resident on battle management, command and control (BMC2) platforms such as E-3, E-2, E-8, and CRC form the underlying foundation of the COP. These weapons systems use their organic wide-area surveillance radars to develop battlespace situational awareness for battle managers executing real-time tactical battle management decisions and operations. This information is shared near-real time with other networked shooters, warfighters and intelligence centers through tactical data links. It facilitates decision making and planning at all levels, from Secretary of Defense policy decisions to joint force operation planning. The COP depicts friendly, adversary, and third-party (gray/unknown) force dispositions and contacts on tailored graphical backgrounds. It includes a variety of near-real time friendly and adversary air, ground, space and maritime tracks, threat/warning data, and intelligence broadcasts. The COP provides the means for automatically integrating relevant information and finished intelligence into the graphic—not just electronic intelligence (ELINT) and radar tracks. Annotations should facilitate linkage to order of battle (OB) databases, message traffic, and the ATO. This linkage between imagery and other collateral-level intelligence and operational databases facilitates intelligence analysis, battlespace awareness, operations planning, and assessment by providing intelligence and operations staffs with simultaneous access to the same information.

EVALUATION AND FEEDBACK

After receiving the ISR products, the user evaluates the products to ensure they satisfy the requirement. The user then provides feedback to ISR planners, collection managers, and analysts to ensure the process continues to satisfy the requirement.

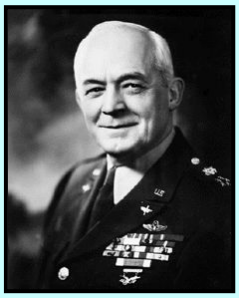
It is imperative that intelligence personnel and consumers at all levels honestly evaluate and provide immediate feedback throughout the intelligence process on how well the various intelligence operations perform to meet the commander's intelligence requirements. All operations in the intelligence process are interrelated and should be evaluated to determine the degree to which they facilitate each other and ultimately succeed in meeting the customer's requirements. For example, planning and direction establish the groundwork for all other intelligence operations, but they are also dependent on the results achieved by other operations in the intelligence process. The collection manager evaluates collection reports, ensures the appropriate requesters receive a copy, and determines, in conjunction with the requesters, if the requirements have been satisfied. Requester feedback establishes customer satisfaction and frees collection assets and resources to be redirected to satisfy other active requirements. Processing and exploitation and analysis and production are evaluated based on the degree to which customers are satisfied that the resulting information or intelligence answers their requirements. Intelligence personnel and consumers at all levels evaluate the quality of intelligence products relative to all the attributes of good intelligence. These attributes include the degree to which intelligence anticipates the needs of the commander, and is timely, accurate, usable, complete, relevant, objective, and available. Finally, intelligence and operations personnel jointly evaluate how well intelligence is disseminated and integrated with operations, and make changes as needed to improve the overall intelligence process.

CHAPTER THREE

ISR ELEMENTS

Strategic air warfare can be neither soundly planned nor efficiently executed without a continuous flow of detailed (intelligence) information....

—General Hap Arnold, USAF

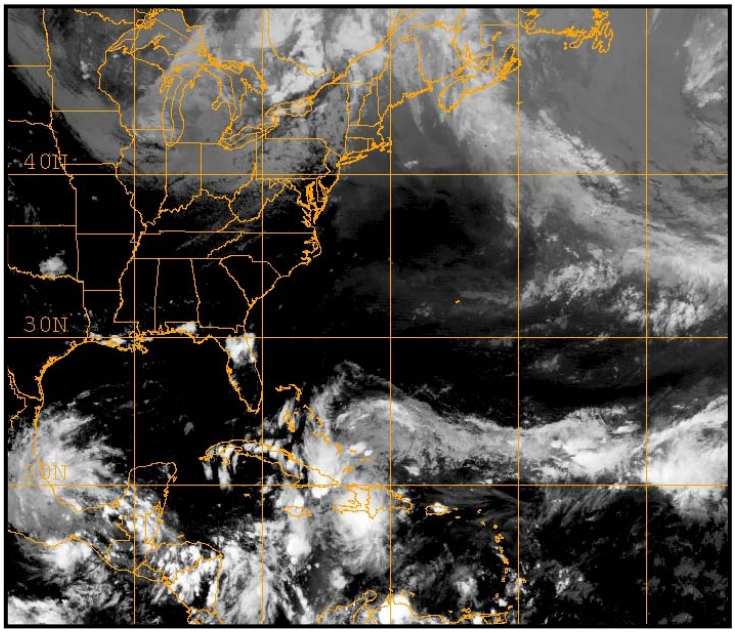


INTELLIGENCE COLLECTION DISCIPLINES

ISR resources collect data that become finished intelligence when processed, analyzed, and integrated. These data can be collected through a wide variety of means. The following is a list of intelligence collection disciplines relevant to Air Force ISR operations.

Geospatial Intelligence

Geospatial intelligence (GEOINT) is defined as exploitation and analysis of imagery and geospatial information to describe, assess, and visually depict physical features and geographically referenced activities on the Earth. Imagery intelligence involves the collection of images that are recorded and stored (on film, digitally, on tape, etc.). These images can be used to help identify and locate adversary military forces and facilities and give the commander insight into the adversary's capabilities. GEOINT can also help provide commanders environmental and geospatial information.



Infrared Weather Imagery of the eastern United States

The principal image types are optical literal image and non-optical non-literal image. Optical literal imagery is essentially traditional visual photos (recorded on film, tape, or electronically) using visible light to illuminate the objects photographed. Optical literal imagery uses natural illumination in the portion of the spectrum that humans can perceive unaided. Non-optical non-literal imagery includes infrared, multispectral, and radar imagery.

Both optical literal and non-optical non-literal imagery have advantages and limitations. For example, optical literal sensor systems that use photographic film are not as responsive since a significantly longer time is required to produce a usable image. Infrared, radar, and multispectral sensors detect emissions in the nonvisual portion of the electromagnetic spectrum. However, infrared signatures can be distorted by aerosols, moisture, and other atmospheric gases, much like the optical portion of the spectrum. Radar imagery requires active illumination by a radio frequency pulse; the reflected return provides an image of the target. Radar will work at night and through rain and cloud cover, unlike optical and infrared imagery. Radar imagery can also detect or differentiate moving vehicles using moving target indicator systems. Multispectral imagery uses data collected simultaneously from two or more spectral regions or bands of the electromagnetic spectrum—in other words, the same scene is imaged in several spectral bands at the same time by the same sensor. The resulting image contains more detailed information than can be obtained through the use of only one band.

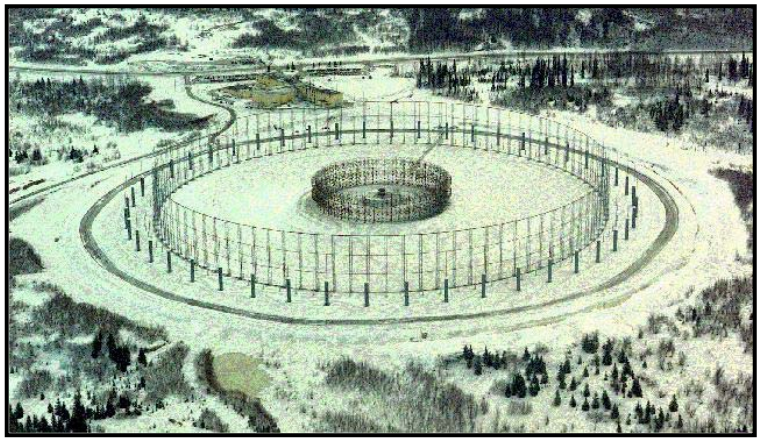
Examples of vertical (left) and oblique imagery

Images can be divided into vertical, oblique, and panoramic imagery. Vertical imagery provides a two-dimensional, overhead view of the target. Oblique imagery provides an angled view of the target area which shows perspective and can be perceived as a three-dimensional view. Panoramic imagery combines the features of both vertical and oblique imagery by scanning from horizon to horizon.

Full-motion video is a new imagery capability that is shortening the sensor-to-shooter cycle by providing the warfighter imagery in real time. Use of full-motion video provided by RQ-1/MQ-1 Predator unmanned aircraft assists commanders in maintaining situational awareness and identification and tracking of targets, and presents the opportunity for our forces to respond as required.

Non-imaging assets also play a key role in GEOINT. Though not as intuitive to the non-intelligence professional, non-imaging assets can provide additional dimensions to an intelligence product. For example, a Defense Support Program (DSP) satellite may provide the first indications of the existence of a previously unlocated rocket test stand (e.g., thermal signature of a rocket engine test). This information, combined with imagery, can reveal much more than either product alone.

Signals Intelligence



SIGINT ground sites remain an important part of global situational awareness.

SIGINT is defined in JP 1-02 as a category of intelligence comprising either individually or in combination all communications intelligence (COMINT), ELINT, and foreign instrumentation signals intelligence (FISINT), however transmitted. More specifically, SIGINT uses intercepted electromagnetic emissions to provide information on the capabilities, intentions, form-actions, and locations of adversary forces. COMINT consists of information derived from intercepting, monitoring, and locating the adversary's communications systems. COMINT exploits the adversary's communications, revealing the adversary's intentions. ELINT consists of information derived from intercepting, monitoring, and locating the adversary's noncommunication emitters. It exploits the adversary's radar, beacon, and other noncommunication signals, allowing friendly forces to locate adversary radars and air defense systems over a wide area. FISINT consists of technical information derived from the intercept of electromagnetic emissions, such as telemetry, associated with the testing and operational deployment of foreign air and space, surface, and subsurface systems. FISINT can provide technical details of foreign weapons system development so US forces can respond quickly to new technological developments.

Measurement and Signature Intelligence

Measurement and signature intelligence (MASINT) is scientific and technical intelligence obtained by quantitative and qualitative analysis of data (metric, angle, spatial, wavelength, time dependence, modulation, plasma, and hydromagnetic) derived

from specific technical sensors for the purpose of identifying any distinctive features associated with the target. The detected feature may be either reflected or emitted. Examples of MASINT might include distinctive infrared signatures, electronic signals, or unique sound characteristics. MASINT can be collected by ground, airborne, sea, and space-based systems. MASINT can be used to monitor potential adversary technical developments and deployments, as well as emerging weapons of mass destruction (WMD) threats. While MASINT is often used in scientific and technical intelligence (S&TI) products, it is becoming increasingly important in the operational area.

Human Resources Intelligence

HUMINT is the intelligence collection discipline that uses people in the area of interest to identify or provide insight into adversary plans and intentions, research and development, strategy, doctrine, and capabilities. Some examples of HUMINT collection include clandestine acquisition of photography, documents, and other material; overt collection by air attaches in diplomatic and consular posts; debriefing of foreign nationals and US citizens who travel abroad; official contacts with foreign governments, aircrew and ground personnel debriefing, and SOF intelligence collection missions.

Open-Source Intelligence

Open-source intelligence (OSINT) is the intelligence collection discipline that uses information of intelligence value that is available to the general public. Particular sources are newspapers, other publications, radio and television media, and the internet. OSINT processing transforms text, graphics, sound, and video into useable information in response to user requirements. For example, at the national level, the Directorate of National Intelligence (DNI) Open Source Center provides translations of foreign broadcast and print media.

ISR RESOURCES

This section describes the types of resources employed to satisfy information requirements through the ISR process. Many of the systems that provide input to the ISR process are not dedicated ISR resources or systems. System ownership may be less important than the actual information satisfying the consumer's requirements.

Airborne Systems

Airborne systems are among the primary sources of ISR capabilities available to support the joint force's intelligence requirements. These systems have varying, but complementary, operating characteristics and restrictions.

Unmanned Aircraft Systems (UAS)

UAS provide significant advantages over other reconnaissance assets, but commanders must be aware of their limitations. The greatest advantage of these systems is that they normally do not put friendly personnel at risk, can have relatively long loiter times, and are generally less expensive than today's high-value manned assets. UAS limitations vary according to system and operational requirements. UAS technology is maturing rapidly, and platforms can be configured with a broad range of imagery sensors or weapons payloads. Because control authorities and mission priorities can shift between users during multi-role UAS missions, commanders should carefully delineate clear lines of authority (See the section on ISR and multi-role aircraft employment, Chapter 4).

Most UAS are tactical in nature, characterized by specific mission capabilities and relatively small area coverage. A new breed of UAS is designed to expand the capabilities to meet the ever increasing demands for intelligence on today's fast-paced battlefield. The Global Hawk high altitude endurance UAS provides broad area coverage and an extended mission range. With enhanced sensor payloads such as an electro-optical/infrared sensor and synthetic aperture radar (SAR) with moving target indicator (MTI) capability, Global Hawk is a day/night, all-weather reconnaissance system. The 14,000 nautical mile range and 35 hour endurance of the air vehicle, combined with satellite and line-of-sight communication links to ground forces, permits world-wide operation of the system. Sensor data can be rapidly processed, correlated to a geographical grid and merged with live and stored images. Spatial information can be presented over common map displays, showing a detailed multi-dimensional situational picture.

UAS flight paths can be preprogrammed or remotely controlled. Recent campaigns have taught us the value of these assets and new systems are envisioned with even greater capabilities to include signals intelligence sensors. Commanders should understand UAS capabilities to support mission requirements as well as their limitations.

UAS come in all shapes and sizes. While they provide valuable surveillance and reconnaissance capabilities, the proliferation of these assets requires definitive command and control relationships and airspace control.

Manned Platforms

Manned airborne ISR platforms and their associated ground stations generally are among the most responsive assets available. They are capable of carrying out critical missions by collecting vital information in near-real time. Aircrews can recognize and respond to changing conditions and are able to modify missions while they are in progress. With their ability to fly long distances, manned platforms can cover a large area with a mix of sensors. Many of these assets have a common data link between aircraft or with ground stations allowing them to distribute large volumes of information in near-real time. Manned airborne ISR capabilities can be divided into two groups: standoff and penetrating.

During peacetime, the majority of airborne ISR missions are accomplished using standoff techniques. The standoff mode is used during military operations when the threat is too great to allow high value assets to penetrate adversary territory or when overflight of an area cannot be completed due to political sensitivities. The primary advantage of the standoff mode is that assets are relatively free from adversary surface-to-air and air-to-air attacks. The primary disadvantage is the limited range and depth of sensor coverage. An example of an ISR platform that uses standoff techniques is the RC-135 RIVET JOINT. Additional examples of standoff battle management, command and control systems with organic surveillance sensors are the E-8 joint surveillance target attack radar system (JSTARS) and E-3 airborne warning and control system (AWACS). (Refer to the Air Force Tactics, Techniques, and Procedures [AFTTP] 3-1 series for individual systems.)

The JSTARS uses a multi-mode side looking radar to detect, track, and classify moving ground vehicles in all conditions deep behind enemy lines.

If necessary, manned BMC2 and ISR aircraft may, upon proper authorization, penetrate threat areas when the target is beyond standoff range and other systems are not available to provide the required coverage, or when weather conditions are such that standoff systems are ineffective. Standoff systems may penetrate hostile airspace when the threat has been suppressed or when mission priority justifies the risk. Because they are high value assets and exist in small numbers, the main disadvantage of manned ISR systems is

the exposure or potential exposure of personnel and equipment to adversary threats. Like UAS, some manned airborne assets are also susceptible to adverse weather conditions. Other collection capabilities, such as targeting pods on the F-16, will allow under-the-weather imaging in a threat environment. As UAS development continues, manned reconnaissance in hostile airspace will likely be limited to a relatively small set of high priority targets. However, UAS and manned aircraft will continue to be subject to host nation overflight and access restrictions en route to and within the AOR based on international law, custom and practice, and arrangements outlined in the DOD 4500.54-G, *DOD Foreign Clearance Guide*.

Space-based Systems

Space-based ISR systems are an integral part of military forces providing support across the range of military operations. Space systems help provide information to commanders allowing them to quickly assess the situation, develop concepts of operation, and distribute changes to their forces. However, commanders must also be aware of the advantages and limitations of these systems. The prime advantage of these systems is their ability to provide worldwide coverage, especially those remote or hostile areas where little or no data can be obtained from ground and airborne sources. Other advantages these systems possess include mission longevity and relative immunity from adversary action.

While able to provide worldwide coverage, demands on individual space-based systems often exceed their capacity and their associated orbit requirements may limit their ability to meet operational requirements. Space systems are divided into military, nonmilitary, and national systems.

A Titan IVB space launch vehicle carrying a DSP satellite that will add to a constellation of similar satellites the Air Force uses to provide early warning of missile launches worldwide.

Military Systems

Military space ISR systems employ a variety of sensor suites and provide a broad range of capabilities. During peacetime, space systems routinely support activities such as training exercises, peacekeeping operations, indications and warning (I&W), disaster and humanitarian relief efforts, counterterrorism, and counternarcotics operations.

Space-based ISR systems' unique advantage of near global coverage allows commanders to observe areas of interest over great distances and where other ISR systems cannot be employed. Detection and warning sensors provide early detection of ballistic missile attack and downlink this information to the appropriate ground stations, allowing commanders to take the appropriate actions against ballistic missile attack. Environmental monitoring systems are crucial to providing an asymmetric warfighting advantage in which we anticipate and exploit the condition of the atmosphere, oceans, soil, and the space environment in order to support friendly and adversary military operations. Awareness of environmental conditions can be the difference between the success or failure of an operation or mission. Accurate weather forecasting also helps commanders anticipate conditions and exploit weather to their advantage.

Space-based ISR systems can also provide military forces with geographic and detailed terrain information that enhances mission planning capabilities. Additionally, these systems can often cue or be cued by other ISR systems to watch a specific area of interest, enhancing accuracy and reaction times for the users of that information. Finally, space communications support ISR operations by distributing the products generated from ISR systems while navigation systems provide ISR sensors with accurate positioning information.

Nonmilitary Systems

Nonmilitary space systems normally complement military space systems and include civil, commercial, and allied capabilities. These systems possess a variety of capabilities; however, in some cases their availability may be limited. Two examples of these systems are weather and multispectral imagery satellites. Theater commanders may be able to task these systems directly, depending on the terms of share-use agreements with the owners.

National Satellite Systems

National satellite systems are controlled by the US intelligence community and provide support to the President, the Secretary of Defense and the military at all levels. These resources provide critical data and are becoming increasingly responsive to military information needs. National systems provide critical support when aircraft are denied access or when access is limited by the capability or range of other systems.

Ground-based Systems

Air Force ground-based ISR systems are not limited to traditional intelligence collection architectures. They also include the space surveillance network (SSN), the ground-based missile warning sensor system, and those systems used by the theater air control system (TACS) for battle management, airspace management, aircraft control, and surveillance.

Missile Early Warning System—Ground-based collection can come from many sources.

Other ground-based "systems" include SOF and other HUMINT collection capabilities. Normally, these systems are not tasked as ISR assets but provide surveillance information as a by-product of their primary mission.

Traditional Ground-based Collection

Ground sites around the world are equipped and tasked to collect information within any of the disciplines previously described (e.g., SIGINT, MASINT, etc.). These sites may satisfy national, theater, or local information requirements, or any combination of these.

- Air Surveillance and Acquisition Radars. Ground-based surveillance systems used to control the movement of aircraft provide a degree of warning and control over air resources within a designated airspace control area. Examples of these systems are ground control intercept (GCI), early warning radars, and tracking and acquisition radars. The advantage of these systems is that they provide an additional layer of control and observation that may not be available with other surveillance systems. Although some ground-based GCI systems are highly mobile, one of the primary disadvantages is their lack of mobility. Also, some of the ground-based warning sensors have unique sensor limitations and are susceptible to adverse atmospheric conditions. In addition, air defense sensors are limited to line-of-sight surveillance.

- Missile Warning and Space Surveillance. Significant ground-based ISR resources are the SSN and ground-based missile warning sensor system. The SSN's purpose is to find, fix, track, and characterize manmade objects in space. An example of an SSN system is the ground-based electro-optical deep space surveillance (GEODSS)

system. SSN data are used to help determine adversary space OB, adversary satellite overflight warning, and adversary satellite status. This information is available to theater commanders. Although ground-based missile warning sensors primarily provide missile warning and attack assessment of a ballistic missile attack, they also contribute to space surveillance. One example of this type of system is the ballistic missile early warning system. The SSN and ground-based missile warning sensors can provide advance notice of hostile over flights to theater commanders. Combatant commanders or JFCs may be called upon to protect these systems from adversary attack within their AOR.

Human Intelligence Sources

Despite the sophistication of long-range sensors and overhead platforms, there are circumstances in which the precision, timeliness, or access requirements (e.g., underground facilities) for reporting critical information requires a skilled eye on the target. Following are some forms of human-resourced information of ISR value.

- Dedicated HUMINT Collectors. Dedicated human resources may be tasked to support theater commanders or national-level agencies. Dedicated HUMINT collectors can also contribute information to the overall ISR picture and can often amplify, clarify, or verify information collected by other airborne, ground-based, or space-based assets. In many cases, HUMINT, along with counterintelligence activities, are the best and only sources of adversary intentions. The Air Force currently relies primarily on DOD and other national-level agencies to provide operational and strategic HUMINT support.

SOF can provide valuable HUMINT to commanders.

- Special Operations Forces. SOF conduct special reconnaissance (SR) operations to obtain or verify information about adversary capabilities, intentions, and activities, or to gather data about meteorological, hydrographic, or geographical characteristics of an area. SR operations complement national and theater ISR resources by obtaining specific, time-sensitive information of strategic and operational significance. SOF have technically knowledgeable observers who may be able to verify critical information about targets or target complexes. These observers attempt to defeat adversary deception efforts and transmit a more complete picture of what is happening at the target area.

- Aircrews and Ground Personnel. Human visual surveillance and reconnaissance are the most basic and the oldest methods of intelligence gathering. Today, visual surveillance and reconnaissance information come from a wide range of sources and often simply entail observer reporting and debriefing activities. While there are some limitations, observers can include aircrews flying any type of aircraft or SOF conducting assigned missions as described above. Additionally, information gained from onboard aircraft systems such as weapon system, video, and defensive countermeasure suites can provide invaluable ISR information during operations. Security forces, explosive ordnance personnel, and other Airmen who operate outside the base perimeter are also sources of information that are of intelligence value.

Combat Camera supports DOD and Air Force senior leadership.

- Combat Camera. While not a dedicated ISR asset, Combat Camera and their products can play a significant role in the fusion process or in providing graphic support to intelligence assessments. The mission of Combat Camera is to support DOD and Air Force senior leadership with timely and informative visual imagery that will enhance their daily operational decisions and assessments during both combat and peacetime contingencies. Combat Camera technicians operate still and video imagery systems that can distribute images within a six-hour response time.

Non-Traditional ISR Resources

When developing collection plans, to include addressing immediate operational environment needs, collection managers should keep in mind that available resources are not limited to platforms or sensors that were specifically designed to collect intelligence. Ground based radars for GCI, early warning, tracking, and acquisition are used to control the movement of aircraft and provide a degree of warning within designated airspace. The air picture they provide can be simultaneously exploited for real-time data of potential intelligence value. With the increasing sophistication of airborne sensors, many, if not all, aircraft can conduct reconnaissance or surveillance to varying degrees, even if intelligence collection is not their primary mission. Some examples of non-traditional capabilities include F-16 tactical airborne reconnaissance systems, F-16CJs collecting SIGINT, F-15Es collecting imagery via their targeting pods, and AC-130s using video capabilities to monitor a particular building. Understanding how to integrate these capabilities into the collection plan is increasingly important, as traditional intelligence collection-only assets can rarely satisfy all collection requirements. Typically, collection managers will not be able to directly

New systems, like the F-22, are designed with sensors that collect valuable intelligence.

task such assets, and will need to coordinate with operations personnel in the strategy, combat plans, or combat operations division of the AOC to do so. As such, collection managers should understand the broad range of collection capabilities associated with such aircraft and, based on this knowledge, articulate the intelligence these assets can provide. Depending on the operation, these assets can be called upon to provide a wide range of intelligence collection support, from providing GEOINT for IPOE, collecting post-strike intelligence for assessment to performing ad hoc collection for emerging threats. The availability of these assets may be haphazard, at best, and collection managers should have knowledge of the current operational environment to take advantage of these capabilities when they become available. ISR professionals may require additional training and on-the-job experience in order to gain the greatest benefit from these capabilities.

Tasking, Collecting, Processing, Exploitation, and Dissemination Systems

Many of the ISR systems mentioned above send the data they collect to tasking, collecting, processing, exploitation, and dissemination (TCPED) systems. The Air Force's primary TCPED system is the AF DCGS, a network-centric, global enterprise designated as the Air Force AN/GSQ-272 SENTINEL ISR weapon system. It is tasked and managed to support CCDRs and forces—primarily at the JTF level and below—with actionable, decision-quality information in accordance with established priorities as approved by the Secretary of Defense via the Joint Chiefs of Staff deployment order process. It operates with the full flexibility of the established intelligence process, as detailed in JP 2-01, *Joint and National Intelligence Support to Military Operations*, in order to make usable information immediately and simultaneously available to both engaged forces and intelligence analysts. AF DCGS takes advantage of Air Force, sister-Service, national, and coalition sensors in the air, on land, in space, and at sea spanning multiple intelligence (multi-INT) sources and provides tailored, correlated information to those who need it in the formats, timelines, and channels they need it, at all levels across the globe in peace and in combat. It is scalable and comprised of fixed and deployable total force components capable of forward-based activities and robust, full-scale reachback operations. AF DCGS is a component of the larger DOD DCGS enterprise.

PRODUCTS

Intelligence products can be used in a variety of ways to support national-level decision makers, theater commanders, and individual warfighters. In a general sense, situational awareness (SA) is a major goal of ISR operations. SA is provided at a number of levels. For example, it could mean passing direct threat warning information to a pilot in near-real time or providing a combatant commander with a comprehensive picture of the AOR's operational environment. Information must be communicated to be effective. Intelligence can be tailored through formal reporting methods, informal or formal briefings, memos or background papers, annotated imagery, graphic or video presentations, dynamic databases, and near-real time displays. Dissemination of

intelligence products depends on the commander's requirements and, to a lesser extent, on the kind of information communicated. For example, it may be best to present current intelligence with a formal or informal briefing instead of a written product, whereas technical intelligence may be best presented as a written document. Below are some of the capabilities, processes, and products that contribute to SA at all levels and highlight the ISR contribution to Air Force forces.

Indications and Warning (I & W)

ISR performs vital I&W functions. Through continuous surveillance or as required reconnaissance, ISR provides timely and near-real time information necessary to assess potential threats to the US and its allies. The space-based infrared system which detects missile launches is one example of continuous surveillance.

I&W products are derived from a worldwide I&W system that analyzes and integrates operations and intelligence to assess the probability of hostile actions, and provides sufficient warning to preempt, counter, or otherwise moderate their outcome. I&W systems rely on tip-offs from sources at all levels. An integrated and responsive intelligence architecture should be established to satisfy theater requirements. The focus of I&W products varies at each echelon and is most specific at the operational and tactical levels. In general, I&W products focus on the following:

- ✪ Emerging crisis situations and foreign government responses to them.
- ✪ A potential adversary's politico-military intentions, past behaviors, motivations, and doctrine.
- ✪ Significant political, economic, or social situations that could lead to crisis-triggering events in both friendly and adversary states.
- ✪ Changes in adversary force dispositions, military activities, and mobilization status.
- ✪ Adversary information operations capabilities in the region.
- ✪ Key civil or bureaucratic activities that suggest follow-on military activity.
- ✪ Status of other military forces in the AOR or operations.

Current Intelligence

Current intelligence involves producing and disseminating all-source intelligence products on the current situation in a particular area or on activities of specific groups. It is similar to I&W in that both depend upon continuous monitoring of world events and specific activities in an AOR. Information required to produce current intelligence products includes, but is not limited to, the following:

- ✪ Adversary intentions, capabilities, and will to use military force.

- ✪ Potential adversaries' centers of gravity, operational plans, and vulnerabilities.
- ✪ Geographic, environmental, and social analysis of the operational area.
- ✪ Current and forecasted weather conditions that affect potential operational areas.
- ✪ Significant military and political events.
- ✪ Status of strategic transportation nodes (major airfields, seaports, and surface networks).

The information gained during development of current intelligence forms the basis for the general military intelligence (GMI) effort and other analytical products. Conversely, GMI provides the threat backbone through OB, tactics, technology, etc., for producing accurate and meaningful current intelligence.

General Military Intelligence

Current intelligence and GMI efforts are interdependent. GMI produces information concerning the political, economic, and social aspects of foreign countries as well as all information on the organization, operations, and capabilities of selected foreign military forces or groups. GMI products can be tailored to specific air and space force missions. For example, some GMI products support operational planning, while other products may support Air Force modeling and simulation or acquisition efforts. Here are some examples of GMI products:

- ✪ Military-related Infrastructure Assessments. These assessments can provide detailed indicators of an opposing force's capabilities and vulnerabilities, including its warfighting sustainability. Examples include assessments on adversary C2 systems, defense industries, energy production and distribution networks, and transportation systems.
- ✪ Military Capabilities Assessments. Determining the adversary's potential military capability includes identifying forces and dispositions, evaluating their vulnerabilities, and assessing their ability to employ military force to counter friendly force objectives. Specifically, military capability assessments focus on adversary leadership and C2, orders of battle, readiness, sustainability, and technical sophistication.

Situational Awareness

A number of dissemination systems provide near-real time and real time threat, target and friendly status to the JFACC, operational units, and other operators. Air Force surveillance and reconnaissance systems will contribute to building a common operating picture in all domains—land, air, sea, space, and cyberspace. Information from various intelligence disciplines may be fused to form the threat picture. The threat picture can be conveyed to tactical users via audio, video, or data links. In the current

environment of rapidly improving technologies, having the capability to provide rapid, accurate, and timely information is vital.

Intelligence Preparation of the Operational Environment

IPOE is a systematic continuous process of analyzing the threat and environment to help the commander better understand the operational environment. The IPOE methodology is an effective analytical process used during peacetime and during hostilities at all levels of command.

IPOE is a valuable methodology for focusing intelligence on the commander and the commander's supporting C2 elements. IPOE facilitates getting "inside" the enemy's decision-making cycle. Specifically, IPOE focuses on the interrelationship between the threat and environment and the effect of that interaction on both friendly and enemy courses of action. IPOE results in the production of adversary courses of action, named areas of interest, and high-value targets, which are inputs to the JFACC planning, intelligence collection, and targeting processes. Additional advantages of the IPOE process include integrating analysis, collection management, and targeting processes, as well as providing a standardized analytic approach for training purposes. Air Force intelligence entities at all levels of command should use IPOE principles, focusing on environmental and threat characteristics and activities that significantly influence Air Force operations.

Defense and Penetration Analysis

Defense and penetration analysis provides the basis for detailed mission planning and defense suppression, as well as for assessments of friendly force vulnerabilities. For example, intelligence personnel analyze adversary force capabilities to penetrate or operate over or within friendly territory.

Scientific and Technical Intelligence (S&TI)

S&TI products address foreign scientific and technical developments that have warfare potential. These developments include weapon system characteristics, capabilities, vulnerabilities, limitations, and effectiveness; research and development activities related to those systems; and related manufacturing information. ISR-generated S&TI products play a vital role in the acquisition process by allowing the acquisition community to develop new systems or upgrade existing ones to meet current, developing, and potential future threats.

Target Intelligence

ISR operations play a prominent role in the targeting cycle by detecting, locating, and identifying targets, as well as supporting mission planning and assessment. Successful employment of precision munitions against mobile targets often requires near-real time targeting information.

Detection is an ongoing process using surveillance and reconnaissance assets to identify potential targets or significant changes to existing targets. Once detected, a

target should be accurately and precisely located within a designated geospatial reference system.

Identification involves recognizing and classifying targets in sufficient detail to give commanders the ability to make informed decisions on targeting and tactics. Multiple surveillance and reconnaissance missions may be necessary to identify and verify a target. ISR assets can provide the level of detail necessary to support the precision engagement of specific high-value targets.

Examples of targeting production requirements include target threat characteristics and vulnerabilities, adversary capabilities and intentions, adversary centers of gravity, analysis of IW and other non-lethal weapons, and precise target location information and target signatures. Target intelligence products also include current imagery and geospatial information.

Advances in technology have increased the capability for intelligence to be passed directly to the cockpit ("sensor-to-shooter"). For example, RC-135 RIVET JOINT can provide threat information to aircraft performing both counterair and counterland missions. Target imagery can be provided directly to the same aircraft. To effectively use target information, commanders and planners should ensure proper procedures and systems are in place.

Assessment

Assessment is not strictly an ISR responsibility, though ISR forces play a leading role. Assessment encompasses all efforts to evaluate effects and gauge progress toward accomplishment of actions, effects, and objectives. It also helps evaluate requirements for future action. It helps answer several questions: “What happened and what is its impact?” “How is the conflict going?” and “What needs to be done next?” In an effects-based approach, it is not possible to think about actions and their effects without considering how accomplishment of those effects should be measured. Effects and objectives should always be measurable and planning for them should always include a means of measurement and evaluation. It is important to understand assessment as an integral component of the air and space tasking cycle to help define the direction and emphasis of the campaign. Assessment is an inseparable and integral component of the effects-based approach to operations.

Any comprehensive view of assessment should tie evaluation of progress at the tactical level to all other levels of war. An effective assessment construct should also support commanders’ objectives at all levels, support commanders’ decision cycles in real time, and provide the basis for predictive analysis. The proper focus of assessment conducted by the JFACC should be at the operational level of war. An effective assessment construct should address the entire spectrum of operations and all levels of war, permit component validation of assessment elements, focus on effects, standardize federated intelligence support, utilize intelligence specialties effectively, and integrate analysis efforts to the maximum extent possible. This suggests a four-tiered approach that is illustrated in Figure 3.1 and explained further below.

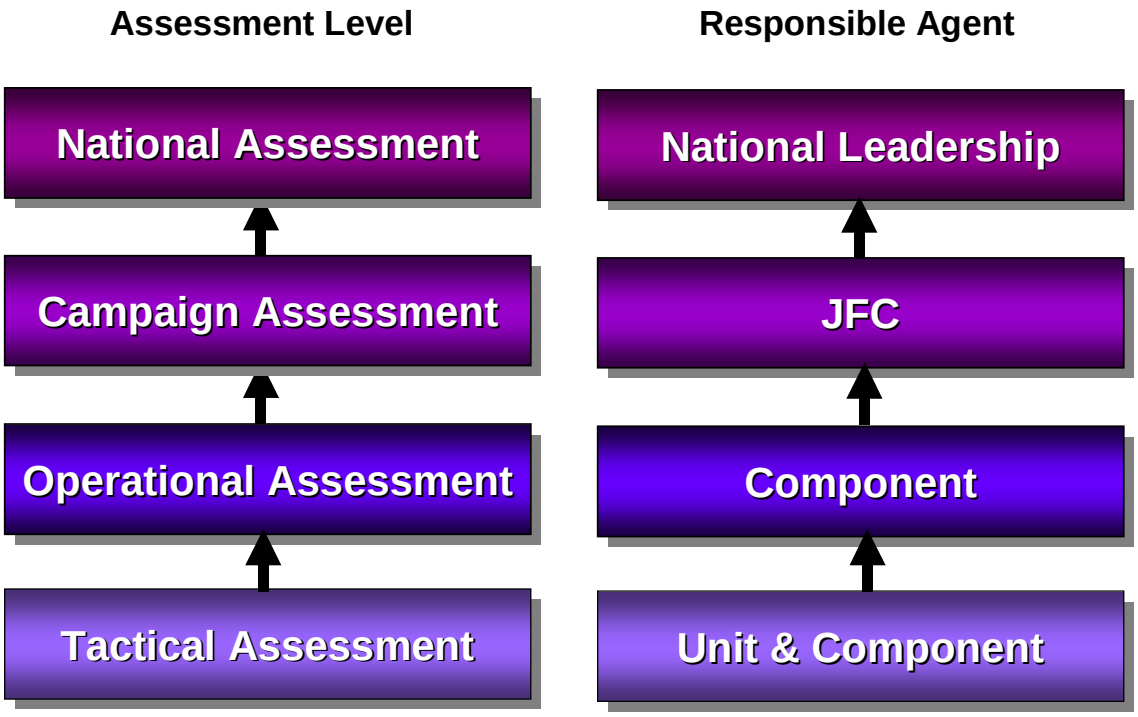


Figure 3.1. Four Levels of Assessment

The Four Levels of Assessment

Assessment consists of four distinct but interrelated levels:

- Tactical Assessment: Determination of the effectiveness of kinetic and non-kinetic tactical military operations through empirical and objective methods.
- Operational Assessment: Evaluation of effects generated by tactical actions and other operational environment influences toward achieving component operational objectives and recommendations for future action. Usually conducted for the JFACC at the AOC by the strategic division's operational assessment team, manned by a mix of operational, ISR, and analysis subject matter experts.
- Campaign Assessment: The JFC's broad qualitative and analytical determination of the overall effectiveness of military operations and recommendations for future action.
- National Assessment: Broad review of the effectiveness of national security strategy and whether national leadership's objectives for a particular crisis or contingency are being met.

For a more detailed description of assessment, see AFDD 2-1.9, *Targeting*.

CHAPTER FOUR

COMMANDING, ORGANIZING, AND EMPLOYING ISR FORCES

Experience in combat theaters has proven the requirement for centralized control by the air commander, of reconnaissance aviation….

—Field Manual 100-20
Command and Employment of Air Power, 1943

Allied "AOC" at Uxbridge, England 1944

Typical AOC Today

COMMAND RELATIONSHIPS

Command relationships delineate the degree of authority commanders have over forces. This chapter discusses ISR command relationships from the combatant commander, JFC, JFACC, COMAFFOR, and national perspectives. Refer to AFDD 2, *Operations and Organization*, for a detailed discussion of command relationships.

The Combatant Commander's Role

The combatant commander employs assigned and attached ISR forces to achieve national and theater objectives. When airborne ISR assets arrive in theater, OPCON may be delegated to the COMAFFOR. The combatant commander is responsible for employment of these assets, to satisfy national, theater, and outstanding component requirements. If necessary the combatant commander will coordinate with other combatant commands to utilize ISR assets not normally assigned to his/her theater, or coordinate the cooperative use of assets to improve coverage. Based on guidance and direction from the combatant commander, the combatant commander's J-2 staff develops an overall collection strategy and posture for the execution of the ISR mission.

The Joint Force Commander's Role

The JFC employs forces attached to the JTF to achieve campaign objectives. The JFC may retain OPCON authority over ISR assets or delegate it to the COMAFFOR. The JFC's staff develops an overall collection strategy and posture for the execution of the ISR mission in coordination with national agencies. The JTF J-2 reviews, validates, and prioritizes all outstanding intelligence requirements, whether originating from the JTF J-2 staff or a component**. The JFC normally delegates OPCON to the COMAFFOR or TACON to the JFACC of airborne ISR assets who will task them to support combat operations via the ATO.**

The Joint Force Air and Space Component Commander's Role

The authority and command relationships of the JFACC are established by the JFC. Normally, the JFACC serves as the supported commander for theater airborne reconnaissance and surveillance and provides integrated ISR for the JFC. The JFACC will exercise TACON authority, as delegated by the JFC, of all Air Force forces assigned or attached to the joint force air component, and over those assets made available for tasking by the other Services. In general, the JFACC's responsibility is to satisfy the JFC's requirements. If the JFACC does not have the available assets or capabilities on hand to satisfy these requirements, the ISR division within the AOC will identify unfulfilled information requirements and forward them to higher headquarters for resolution. Regardless of how the information is eventually gathered, it is imperative the JFACC remains aware of all available surveillance and reconnaissance capabilities that can be integrated into air, space, and information operations

The COMAFFOR’s Role

Through the Forces For Unified Commands memorandum, each combatant commander is assigned a COMAFFOR. As the Service component commander, the COMAFFOR is under the combatant command (COCOM) of the combatant commander to whom he is assigned and directly responsible to that combatant commander for missions and functions that may be assigned to the Air Force component. The combatant commander should normally delegate OPCON over assigned and attached Air Force forces to the COMAFFOR, who also holds administrative control (ADCON) authority over Air Force forces through the Service chain. If the JFC elects to designate an Air Force officer as the JFACC, the COMAFFOR, as the Service component commander with the preponderance of air and space assets and the ability to effectively command and control joint air and space assets, will be dual-hatted as the JFACC and will exercise authority through a joint or combined air and space operations center. The JFACC should normally be the supported commander for theater airborne reconnaissance and surveillance, as well as the area air defense commander, and the airspace control authority. These functions demand integration to ensure unity of command and effort.

National Support

National and non-DOD ISR resources are not a part of the JFC's OPCON authority. These resources may provide support to the JFC or one of the components, either full-time or on-call, but are normally shared with other commands, components, or government agencies. The supported commander will be provided liaison teams upon request, such as the NIST. The NIST mission is to provide national level, all-source intelligence support throughout the intelligence community to deployed commanders during crisis or contingency operations. NISTs are comprised of intelligence and communications experts from DIA, CIA, NGA, NSA, and other agencies as required. These teams will normally be the points of contact for coordinating their specific ISR resources and associated capabilities with the supported commander's collection managers. Collection managers forward the requirements to the appropriate command authority for action. In the event of war or periods of crisis, the President may direct the military to exercise greater responsibility for tasking of collections systems. National intelligence collection tasking authority may pass from the Director of National Intelligence to the Secretary of Defense. The JFC may request CMA from the Secretary of Defense and SIGINT operational tasking authority (SOTA) from the Director of the National Security Agency if required to carry out missions assigned to the command.

ORGANIZATION AND EMPLOYMENT

The AOC is the best location to integrate the JFC's theaterwide airborne ISR capabilities, to include reachback and distributed operations ISR support. AFDD 2, *Operations and Organization*, states that one of the responsibilities of the AOC is to plan, task, and execute the theater airborne ISR mission. Subtasks of this responsibility include:

- ✪ Identify and manage JFACC requirements.
- ✪ Manage JFC (theater-level) requirements in conjunction with other Service components and with validation from the JFC.
- ✪ Integrate and synchronize use of air and space assets.
- ✪ Task theater airborne ISR assets to satisfy the JFC's requirements.

JP 3-30, *Command and Control for Joint Air Operations*, states the responsibilities of the JFACC include "planning, coordinating, allocating, and tasking assigned airborne ISR assets to accomplish and fulfill JFC tasks and requirements." Whenever joint and Service mission needs dictate, it is more advantageous to the warfighter to train, equip, organize, and operate centralized ISR under the JFACC and within the AOC structure. The JFACC can best support ISR operations in strategy development and can best execute the planning, tasking, and direction of ISR missions.

Role of the Air and Space Component's A-2

As the Air Force Service component commander for the joint force, the COMAFFOR is responsible for presenting Air Force ISR capabilities to the JFC. The COMAFFOR's A-2 directs Air Force intelligence forces by recommending policy and guidance and ensuring coordination among various intelligence functions. The intelligence structure should be designed to expedite tailored intelligence to operational units. The A-2 exercises day-to-day responsibility for intelligence support to the COMAFFOR and assigned/attached Air Force forces. This includes the following:

- Serves as Air Force forces senior intelligence officer. Advises the COMAFFOR on all intelligence matters impacting mission accomplishment. Recommends Air Force intelligence policy and guidance for operations within the JOA.
- Establishes, coordinates, and monitors AFFOR ISR requirements and capabilities to support operations in the JOA. Coordinates and monitors JFC ISR requirements.
- Coordinates with JFC staff to establish relationships governing federated ISR operations and distributed operations in theater.
- Validates unit intelligence and systems requirements and manages fielding and operation of automated intelligence systems.
- Participates in the contingency planning processes and development of Annex B, Intelligence; Annex M, Geospatial Information; and Services annexes to OPLANs, CONPLANs, and operation orders (OPORDs). Assists the A-3 in developing the COMAFFOR's CCIR by developing PIRs.
- Coordinates the COMAFFOR's current intelligence and situational awareness support, to include briefings and situation report inputs.
- Coordinates with allied/coalition host nations regarding support systems and intelligence infrastructure.
- Plans intelligence architecture support to satisfy Service-specific weapon system employment requirements in accordance with theater/JOA operations plans.
- Establishes procedures for and manages theater/JOA production requests and RFIs. Validates, prioritizes, and sources unit requirements for intelligence information.
- Establishes, conducts, and maintains liaison with Air Staff A-2 and national intelligence community organizations.
- Supports the threat working group and force protection working group providing threat warning, threat analysis and defensive measures recommendations

Role of the ISR Division

The ISR division (ISRD) within the AOC is responsible for effectively orienting the COMAFFOR and AOC to current and emerging enemy capabilities, threats, COAs, and COGs with predictive and actionable intelligence, and to provide the JFACC with ISR operations management and targeting intelligence support. Within the AOC, the ISRD provides information crucial to the air mobility, strategy, combat plans, and combat operations divisions that are planning and executing theater-wide operations. This information helps accomplish the commander's objectives as well as provides the means by which the effects of the operations are measured. Figure 4.1 shows the organization of the ISRD within the AOC and its responsibilities, including:

- Providing analyses of the enemy and a common threat picture to the JFACC and staff planners, other AOC divisions and other Air Force elements in theater.
- Providing, in conjunction with the strategy, combat plans, and combat operations divisions, for planning and executing airborne ISR operations and providing combat ISR support assessment activities for air, space, and information operations planning and execution.
- Directing the AOC's distributed and reachback ISR processes by working with the JTF, national agencies, Air Force organizations, and the TCPED architecture to optimize ISR contributions to the effort.
- Providing direct targeting support to the ATO cycle in response to JFACC guidance.
- Providing all-source intelligence support to other AOC divisions to enhance the execution of their core processes.
- Ensuring actionable, decision quality, all-source IPOE and threat information depicted in the JFACC and AOC picture of the operational environment is consistent with that used by national, joint, component, and theater entities. Aggressively acts to resolve significant differences.
- Ensuring Air Force ISR is optimally managed to operate within the context of large and complex national and joint intelligence architectures. Serves as the focal point for multiple nodes to work together in order to meet the high demand for information.
- Serving as the senior intelligence element of the TACS, to integrate ISR platforms and other Air Force ISR elements external to the AOC in support of the joint force.

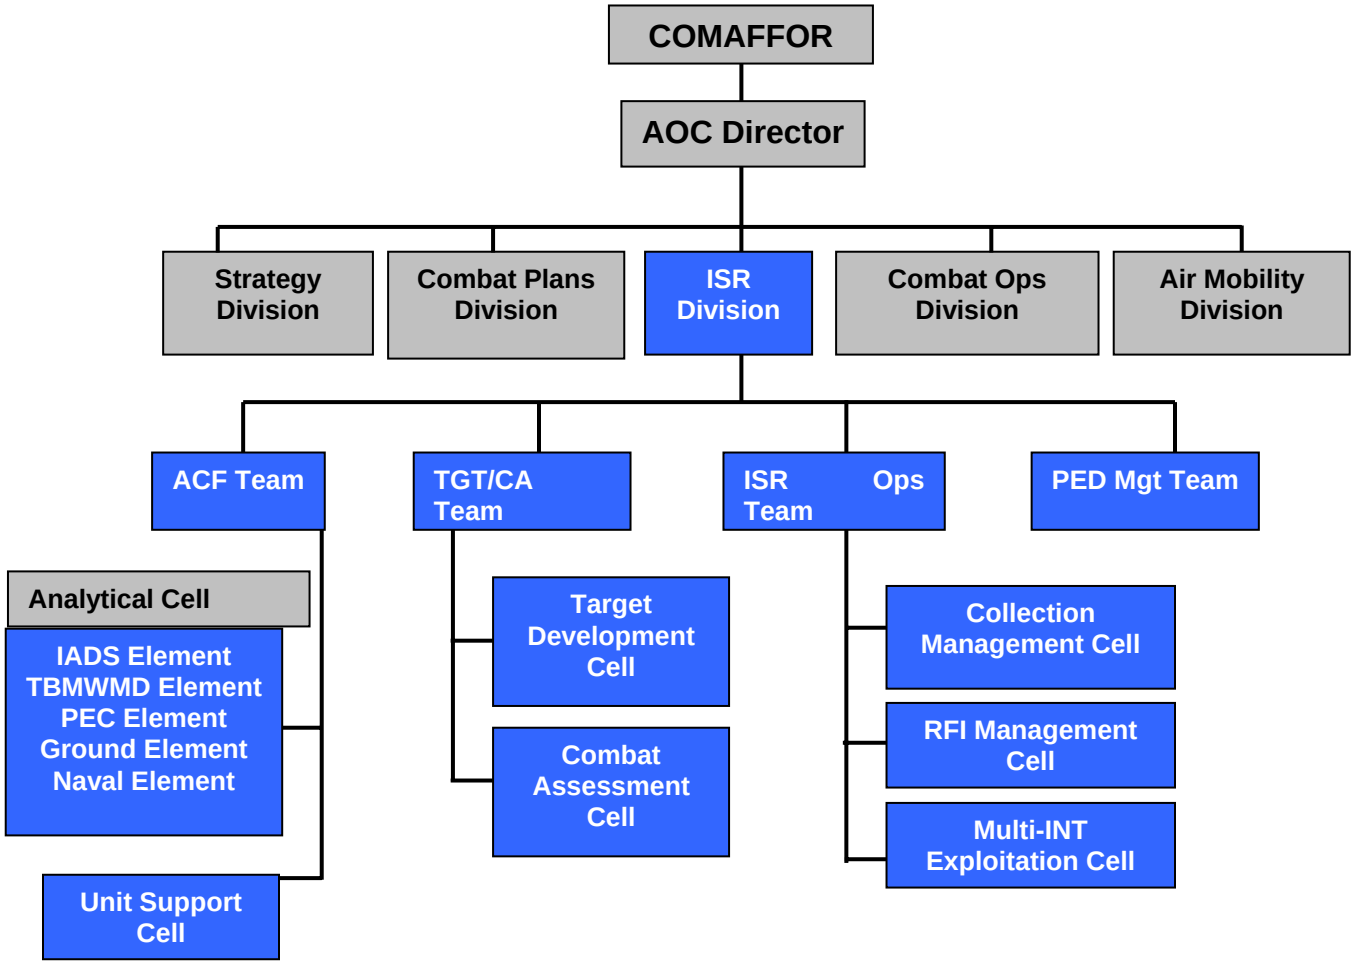

Figure 4.1. The ISR Division's Core Teams

ISR Authorities

Various military missions may be operating within a single AOR that require ISR support. While modern ISR capabilities provide the flexibility to distribute direction and control to a number of users, this flexibility creates challenges for command and control that are not addressed by the basic command relationships described in JP 1, *Doctrine for the Armed Forces of the United States*. This section provides definitions, derived from basic command relationships, for authorities associated with direction and control of ISR operations.

Operational missions in theater vary in composition. If there are needs for more than one service or joint component, a JTF may be established in theater and the JFC may be delegated OPCON over forces attached or assigned. Most often, joint forces are organized with a combination of Service and functional component commands and subordinate task forces with operational responsibilities. The theater J-2 should remain informed of all intelligence collection requirements being levied on assets and resources

within the combatant commander's AOR. The theater J-2 retains full management authority (i.e., to validate, to modify, or to nonconcur) over all intelligence collection requirements within the AOR. This authority may be delegated to a subordinate JFC. The JFC, if allocated a specific set of ISR assets from the combatant commander, will be delegated the necessary authority to employ these assets. However, tasking and employment of any ISR asset required to support more than one JTF commander will be coordinated and deconflicted by a common superior commander to the JTF commanders.

CMA is the authority to determine the priority, focus, and weight of ISR efforts across multiple theater missions and tasks by validating theater collection requirements, establishing sensor tasking guidance, and developing theater collection plans. Commanders delegated OPCON over ISR forces may or may not assume CMA of tasking these ISR assets as part of the delegation of authority. Even if a commander has CMA, it does not necessarily mean that CMA extends to authorities over all theater SIGINT ISR assets. CMA usually includes authority to task ISR GEOINT sensors and lower echelon SIGINT collection systems that have more localized collection capabilities. NSA still retains authority over the tasking of strategic-capable SIGINT ISR systems unless the combatant commander has specifically requested and received SOTA over theater-wide capable platforms and sensors. The delegation of SOTA to the combatant commander and subsequent delegation of this authority to the JFC ensures the theater has the ability to prioritize requirements and focus SIGINT collection where it is needed to carry out the mission assigned to the command.

CRM and validation of collection requirement requests for a theater resides at the combatant command level. CRM focuses on the requirements of the customer, is all-source oriented, and advocates what information is necessary for collection. The COM process organizes, directs, and monitors the equipment and personnel that actually collect the data to satisfy requirements. COM develops strategies for collection against requirements in cooperation with CRM; predicts how well a system can satisfy requirements; evaluates the performance of the collection systems; allocates and tasks collection assets and/or resources and processing and/or exploitation systems; and monitors and reports the operational status of collection systems. The COM process is directly linked to collection plan execution through ISR visualization.

JFCs exercise control over an impressive array of organic and attached intelligence collection and analysis resources. Nevertheless, these alone will not be capable of satisfying all the joint force's information requirements. Some theater missions may require ISR resources not organic to the theater or to the components of the subordinate joint force. ISR resources are typically in high demand and requirements usually exceed platform capabilities and inventory. The joint force J-2 relies on both theater and national intelligence organizations for support in order to provide the JFC with the most accurate intelligence possible. Collection requirements should be satisfied at the lowest possible level. Requirements that cannot be satisfied, and that have been validated by the command's collection manager or J-2, should be forwarded to the next higher echelon for action. This process continues until the

requirement is satisfied, the intelligence is no longer needed, or it is determined that the requirement cannot be satisfied. Validated collection requirements and collection requests for theater and national systems will be forwarded for action to the combatant command theater intelligence CMA. Validated collection requirements from components will become part of the theater collection plan and will be collected by theater collectors or forwarded to the combatant command for national collection consideration and prioritization.

The combatant commander may delegate OPCON or TACON over some theater ISR assets to the JFC. The combatant commander, however, retains the authority to validate and prioritize requirements that will be collected by theater ISR assets not provided to the JFC, and for all requirements forwarded for national collection consideration. The portion of the ISR planning process whereby the JFC identifies all theater and national collection requirements to the combatant commander is when the JFC briefs a draft ISR collection plan to the combatant commander at the joint collection management board (JCMB). The product resulting from this board is a validated multi-source theater collection plan, consisting of collection requirements that are allocated to multiple theater and national collection platforms and sensor capabilities. The requirement allocation effort is usually a JFC-delegated task, performed by the JFACC, prior to the JCMB. The JFACC is also the joint force component commander responsible for the execution of ISR forces via the ATO and therefore should be delegated TACON over these executing forces in theater. High priority, time-sensitive requirements are identified and pre-validated by the JFC for the JFACC to consider for dynamic retasking during execution of ISR forces. Two significant command and control responsibilities of ISR authorities are employment and organization of assigned forces.

ISR and Multi-role Aircraft Employment

Roles and missions for many Air Force assets have expanded beyond what was envisioned in their initial concept of employment to include a variety of innovative functions, often employed during the same mission. Today it is not unusual to find strike aircraft employed in a non-traditional ISR role, and some traditional ISR assets have become weapons platforms. Whether the aircraft is dedicated to providing ISR for the entire mission or performing ISR during part of the strike mission, the **mission objectives, priorities, and guidance for multi-role aircraft employment and the authority to task the weapon system should be clear and preferably worked out well in advance of mission execution.** The JFACC should ensure the following authorities are defined to ensure clear lines of control during multi-role missions:

- **Aircraft Control:** Organization or individual in authority and technically capable of controlling the aircraft.

- **Sensor Control:** Organization or individual in authority and technically capable of controlling the aircraft sensor.

- **Sensor Tasking:** Organization with the authority to direct sensor control and aircraft control to execute ISR tasking.

An example of a multi-role platform is the Predator. On a single mission the Predator can shift between reconnaissance, strike, surveillance, force protection, and other roles. By defining control authorities, and mission priorities, the shift in employment between different organizations or customers will expedite smooth transitions. While the Predator is used as the example, there are many platforms that have similar capabilities where the same principles would apply.

Modern ISR assets, such as the Predator UAS, present opportunities for control of the aircraft, weapons, and sensors by many different agencies. Proper definition of authorities for direction and control of these assets is critical.

Direct and Reachback Support to JFACC ISR Employment

Much of today's intelligence support comes from dedicated centers of excellence or agencies where intelligence professionals practice the art of discerning adversary intent and capabilities. Though not always forward deployed, commanders can still rely on the fact that they are working diligently to provide the intelligence JFCs need to achieve battlefield dominance.

Air Force Intelligence, Surveillance, and Reconnaissance Agency (AFISRA)

The AFISRA is a forward operating agency subordinate to the Deputy Chief of Staff (DCS), Intelligence, Surveillance, and Reconnaissance (AF/A2). It is responsible for executing AF/A2 responsibilities in intelligence collection, analysis, and production. AFISRA organizes, trains, equips, presents, and integrates all-source intelligence (e.g., SIGINT, GEOINT, MASINT, HUMINT, etc.) full-spectrum capabilities to the intelligence community, and to JFCs through the COMAFFOR. It provides customers at all echelons with multi-source intelligence products, applications, and services and provides intelligence expertise in the areas of SIGINT, IO (to include information protection), acquisition, foreign weapons systems and technology, and treaty monitoring. When Air Force component intelligence requirements exceed the theater's capabilities, AFISRA may reinforce the combatant command with analytical expertise and products.

Additionally, AFISRA's "centers of excellence" provide detailed analyses and products for Air Force and DOD customers. Specific functions of these centers include vulnerabilities and capabilities analysis on foreign air and space weapons systems and organizations; production of tailored, customer-specific products; and support to US weapon treaty negotiations and compliance verification. Other centers provide leadership in IO and ISR-related activities to support operations, campaign planning, acquisition, and testing.

Wing, Group, and Squadron Intelligence Support

The primary focus of ISR at the operational wing, group, and squadron levels is the application of all-source intelligence information to sustain combat air operations. Although the wing's intelligence capability is focused within a flight of the unit's operations support squadron, intelligence personnel and assets are assigned to each operational squadron or may be assigned or attached to other wing staffs. This ISR capability supports unit deployments, readiness training, mission planning, and other wing-level mission execution functions. Most unit-level intelligence organizations are composed of two branches—operational intelligence (also termed "combat" intelligence) and target intelligence. Each performs a specific function. First, operational intelligence keeps the commander and aircrews informed of intelligence matters needed to perform the mission. It maintains intelligence database holdings, provides briefings and training, and helps with mission planning. Second, target intelligence assembles and maintains mission or planning folders with related target planning documentation. Important ISR functions that may be performed at the unit level include:

- Mission planning and IPOE support.
- Air and space expeditionary task force command element intelligence support.
- Defensive threat capabilities and penetration analysis.
- Mission folder construction and maintenance.
- Aircrew target study, threat training, and certification.
- Debriefing, assessment, aircraft weapons system recorded media exploitation, and intelligence reporting.
- EEI and RFI management.
- Maintenance and operation of intelligence databases, systems, and special security office programs.
- Identification of unit support requirements to include identifying, requisitioning, and safeguarding target materials and geospatial data for combat and training missions.

Air Control Squadrons

Air control units provide surveillance, early warning, airspace control, and airborne battle management capabilities for operations across the spectrum of conflict. While these units do not generally produce raw data specifically designed for the ISR process, much of the information generated by these units is germane and useful to the ISR process and can be used in all-source fusion to create a more accurate picture of the operational environment.

Reconnaissance Units

Air Force reconnaissance units collect and process raw data for input into the ISR process. They are responsible for providing national and theater command authorities with a wide array of timely, reliable, high-quality, reconnaissance products. Air Force reconnaissance units train and equip personnel for worldwide employment in situations across the full range of military operations. Reconnaissance products or data generated by these units are often the chief input into the ISR process; additionally, critical, perishable reconnaissance data can also be routed directly to the shooter in near-real time. Reconnaissance data is often fused together with other intelligence to form a variety of ISR-related products that range from I&W products to long-range assessments of adversary capabilities.

Space Operations Units

Space operations units typically operate military and national-level satellites that collect information to support strategic-, operational-, and tactical-level decision making. These units typically generate raw data for intelligence processing. Forward units can access these data through reachback. Space planning products, like reconnaissance products from manned and unmanned airborne systems, are also fused with various other inputs from the ISR process to create intelligence products.

Other Air Force Intelligence Units

Other Air Force intelligence organizations include the intelligence wing, intelligence group, intelligence squadron and intelligence divisions. The intelligence wing manages the planning of all-source intelligence and assists Air Force components in the development of concepts, exercises, and employment of forces to support the full range of military operations.

Air Force intelligence groups perform a variety of functions. Most intelligence groups are collocated with the MAJCOM they support and often manage intelligence infrastructure and programs and perform lower-echelon unit support. Other specific functions may include the production of tailored intelligence for weapons systems acquisition, mission planning and targeting, collection management, logistics and readiness issues, and communications/computer system support. Some groups manage military and civilian personnel actions and programs, while others maintain imagery data bases, develop aircrew training materials, and provide reachback linkage for deployed intelligence units. Finally, some intelligence groups have specific

operational missions that relate to C2; acquisition/research and development; space surveillance; threat warning and technical analysis; and SIGINT-oriented cryptologic and S&TI support.

Intelligence squadrons collect, process, exploit, and disseminate intelligence in response to taskings from national authorities, theater commanders, and the JFACC. Intelligence squadrons conduct various missions including military capabilities and OB analysis, unit support, targeting support, and GEOINT and SIGINT collection, processing, exploitation, and dissemination.

Intelligence divisions provide intelligence support to technology, acquisition, test, and sustainment organizations. Besides supporting operations, as necessary, intelligence divisions: (1) provide special security; (2) make available intelligence production and applications such as for system threat assessments, program protection, and models and simulations; and (3) facilitate access to foreign materiel and geospatial information and services.

Multinational Intelligence Operations

Multinational operations are becoming the norm for military operations, making intelligence-sharing with allies and coalition partners increasingly important. In some multinational operations or campaigns, JFCs will be able to use existing international standardization agreements (STANAGs) (e.g., NATO STANAGs) as a basis for establishing rules and policies for conducting joint intelligence operations. Since each multinational operation will be unique, such agreements may have to be modified or amended based on the situation. A JFC participating in a coalition or alliance should tailor the policy and procedures for that particular operation based on theater guidance and national policy as contained in National Disclosure Policy (NDP) 1, *National Policy and Procedures for the Disclosure of Classified Military Information to Foreign Governments and International Organizations*. NDP 1 provides policy and procedures in the form of specific disclosure criteria and limitations, definition of terms, release arrangements, and other guidance. The disclosure of classified information is never automatic. Any disclosure should be consistent with US national policy and US military objectives, be done with security assurances in place, present a clearly defined US advantage, and be limited to only necessary information.

[1] Ensure that all records created as a result of processes prescribed in this publication are maintained in accordance with AFMAN 37-123, *Management of Records* and disposed of in accordance with the Air Force Records Disposition Schedule (RDS) located at https://afrims.amc.af.mil/

GLOSSARY

Abbreviations and Acronyms

ACF	analysis, correlation, and fusion
ADCON	administrative control
AFDD	Air Force doctrine document
AFISRA	Air Force Intelligence, Surveillance and Reconnaissance Agency
AFTTP	Air Force tactics, techniques, and procedures
AOC	air and space operations center
AOR	area of responsibility
ATO	air tasking order
AWACS	airborne warning and control system
BDA	battle damage assessment
BMC2	battle management, command and control
C2	command and control
CA	combat assessment
CCDR	combatant commander
CCIR	commander's critical intelligence requirement
CIA	Central Intelligence Agency
CMA	collection management authority
COA	course of action
COCOM	combatant command (command authority)
COG	center of gravity
COM	collection operations management
COMAFFOR	commander, Air Force forces
COMINT	communications intelligence
CONPLAN	concept plans
COP	common operating picture
CRM	collection requirements management
DCGS	distributed common ground system
DIA	Defense Intelligence Agency
DNI	Directorate of National Intelligence
DOD	Department of Defense
DSP	Defense Support Program
EBAO	effects-based approach to operations
EEI	essential elements of information
ELINT	electronic intelligence
FISINT	foreign instrumentation signals intelligence
GCI	ground control intercept

GEODSS	electro-optical deep space surveillance
GEOINT	geospatial intelligence
GMI	general military intelligence
HUMINT	human resources intelligence
I&W	indications & warning
IADS	Integrated air defense system
INTSUM	intelligence summary
IPL	imagery product library
IPOE	intelligence preparation of the operational environment
ISR	intelligence, surveillance, and reconnaissance
ISRD	intelligence, surveillance, and reconnaissance division
JAOC	joint air and space operations center
JCMB	joint collection management board
JFACC	joint force air and space component commander
JFC	joint force commander
JOA	joint operational area
JP	joint publication
JTAC	joint terminal attack controller
JTF	joint task force
JS/J2	joint staff/director of intelligence
JSTARS	joint surveillance target attack radar system
MASINT	measurement and signature intelligence
MOE	measure of effectiveness
MOP	measure of performance
MTI	moving target indicator
multi-INT	multiple intelligence
NATO	North Atlantic Treaty Organization
NDP	national disclosure policy
NGA	National Geospatial-Intelligence Agency
NIST	national intelligence support team
NRO	National Reconnaissance Office
NSA	National Security Agency
OB	order of battle
OODA	observe, orient, decide, act
OPCON	operational control
OPLAN	operation plan
OPORD	operation orders
OSINT	open-source intelligence

PBA	predictive battlespace awareness
PEC	pre-authorized engagement criteria
PED	processing, exploration and dissemination
PIR	priority intelligence requirements
PR	personnel recovery
RFI	request for information
ROE	rules of engagement
ROVER	remote operations video enhanced receiver
RSTA	reconnaissance, surveillance, and target acquisition
S&TI	scientific and technical intelligence
SAM	surface-to-air missile
SA	situational awareness
SAR	synthetic aperture radar
SIGINT	signals intelligence
SOF	special operations forces
SOTA	signals intelligence (SIGINT) operational tasking authority
SR	special reconnaissance
SSN	space surveillance network
STANAG	standardization agreement (NATO)
TACON	tactical control
TACS	theater air control system
TBMWMD	tactical ballistic missile weapon of mass destruction
TCPED	tasking, collecting, processing, exploitation and dissemination
UAS	unmanned aircraft system
WMD	weapons of mass destruction

Definitions

administrative control. Direction or exercise of authority over subordinate or other organizations in respect to administration and support, including organization of Service forces, control of resources and equipment, personnel management, unit logistics, individual and unit training, readiness, mobilization, demobilization, discipline, and other matters not included in the operational missions of the subordinate or other organizations. Also called **ADCON**.
(JP 1-02)

all-source intelligence. 1. Intelligence products and/or organizations and activities that incorporate all sources of information, most frequently including human resources intelligence, imagery intelligence, measurement and signature intelligence, signals intelligence, and open-source data in the production of finished intelligence. 2. In intelligence collection, a phrase that indicates that in the satisfaction of intelligence requirements, all collection, processing, exploitation, and reporting systems and resources are identified for possible use and those most capable are tasked. (JP 1-02)

analysis and production. In intelligence usage, the conversion of processed information into intelligence through the integration, evaluation, analysis, and interpretation of all source data and the preparation of intelligence products in support of known or anticipated user requirements. (JP 1-02)

air and space operations center. The senior agency of the Air Force component commander that provides command and control of Air Force air and space operations and coordinates with other components and Services. Also called **AOC** (AFDD 2)

air tasking order. A method used to task and disseminate to components, subordinate units, and command and control agencies projected sorties/capabilities/forces to targets and specific missions. Normally provides specific instructions to include call signs, targets, controlling agencies, etc., as well as general instructions. Also called **ATO**. (JP 1-02)

battle damage assessment. The timely and accurate estimate of damage resulting from the application of military force, either lethal or non-lethal, against a predetermined objective. Battle damage assessment can be applied to the employment of all types of weapon systems (air, ground, naval, and special forces weapon systems) throughout the range of military operations. Battle damage assessment is primarily an intelligence responsibility with required inputs and coordination from the operators. Battle damage assessment is composed of physical damage assessment, functional damage assessment, and target system assessment. Also called **BDA**. (JP 1-02)

battlespace. The environment, factors, and conditions that must be understood to successfully apply combat power, protect the force, or complete the mission. This includes the air, land, sea, space, and the included enemy and friendly forces; facilities; weather; terrain; the electromagnetic spectrum; and the information environment within the operational areas and areas of interest.
(JP 1-02)

collection. In intelligence usage, the acquisition of information and the provision of this information to processing elements. (JP 1-02)

collection asset. A collection system, platform, or capability that is supporting,

assigned, or attached to a particular commander. (JP 1-02)

collection management authority. Constitutes the authority to establish, prioritize, and validate theater collection requirements, establish sensor tasking guidance, and develop theater collection plans. Also called **CMA**. (JP 1-02)

collection manager. An individual with responsibility for the timely and efficient tasking of organic collection resources and the development of requirements for theater and national assets that could satisfy specific information needs in support of the mission. (JP 1-02)

collection management. In intelligence usage, the process of converting intelligence requirements into collection requirements, establishing priorities, tasking or coordinating with appropriate collection sources or agencies, monitoring results, and retasking, as required. (JP 1-02)

collection operations management. The authoritative direction, scheduling, and control of specific collection operations and associated processing, exploitation, and reporting resources. Also called **COM**. See also collection management; collections requirements management. (JP 1-02)

collection plan. A plan for collecting information from all available sources to meet intelligence requirements and for transforming those requirements into orders and requests to appropriate agencies. (JP 1-02)

collection requirement. An established intelligence need considered in the allocation of intelligence resources to fulfill the essential elements of information and other intelligence needs of a commander. (JP 1-02)

collection requirements management. The authoritative development and control of collection, processing, exploitation, and/or reporting requirements that normally result in either the direct tasking of assets over which the collection manager has authority, or the generation of tasking requests to collection management authorities at a higher, lower, or lateral echelon to accomplish the collection mission. Also called **CRM**. (JP 1-02)

collection resource. A collection system, platform, or capability that is not assigned or attached to a specific unit or echelon which must be requested and coordinated through the chain of command. (JP 1-02)

combat assessment. The determination of the overall effectiveness of force employment during military operations. Combat assessment is composed of three major components: (a) battle damage assessment; (b) munitions effectiveness assessment; and (c) reattack recommendation. Also called **CA**. (JP 1-02)

combatant command (command authority). The nontransferable command authority established by Title 10 ("Armed Forces"), USC, Section 164, exercised only by commanders of unified or specified combatant commands unless otherwise directed by the President or Secretary of Defense. Combatant command (command authority) cannot be delegated and is the authority of a combatant commander to perform those functions of command over assigned forces involving organizing and employing commands and forces, assigning tasks, designating objectives, and giving authoritative direction over all aspects of military operations, joint training, and logistics necessary to accomplish the missions assigned to the command. Combatant command (command authority) should be exercised through the commanders of subordinate organizations. Normally this authority is exercised through subordinate joint commanders and Service and /or functional component commanders. Combatant command (command authority) provides full authority to organize and employ commands and forces as the combatant commander considers necessary to accomplish assigned missions. Operational control is inherent in combatant command. Also called **COCOM**. (JP 1-02)

command and control. The exercise of authority and direction by a properly designated commander over assigned and attached forces in the accomplishment of the mission. Command and control functions are performed through an arrangement of personnel, equipment, communications, facilities, and procedures employed by a commander in planning, directing, coordinating, and controlling forces and operations in the accomplishment of the mission. Also called **C2**. (JP 1-02)

commander's critical information requirements. Commander's critical information requirements comprise information requirements identified by the commander as being critical in facilitating timely information management and the decision-making process that affect successful mission accomplishment. The two key subcomponents are critical friendly force information and priority intelligence requirements. Also called **CCIR**. (JP 1-02)

common operational picture. A single identical display of relevant information shared by more than one command. A common operational picture facilitates collaborative planning and assists all echelons to achieve situational awareness. Also called **COP**. (JP 1-02)

communications intelligence. Technical information and intelligence derived from foreign communications by other than the intended recipients. Also called **COMINT**. (JP 1-02)

counterintelligence. Information gathered and activities conducted to protect against espionage, other intelligence activities, sabotage or assassinations conducted by or on behalf of foreign governments or elements thereof, foreign organizations, or foreign persons, or international terrorist activities. (JP 1-02)

critical information. Specific facts about friendly intentions, capabilities, and activities vitally needed by adversaries for them to plan and act effectively so as to guarantee failure or unacceptable consequences for friendly mission accomplishment. (JP 1-02)

current intelligence. One of two categories of descriptive intelligence that is concerned with describing the existing situation. (JP 1-02)

deception. Those measures designed to mislead the enemy by manipulation, distortion, or falsification of evidence to induce him to react in a manner prejudicial to his interests. See also **counterdeception.** (JP 1-02)

distributed operations. The process of conducting operations from independent or interdependent nodes in a teaming manner. Some operational planning or decision-making may occur from outside the joint area of operations. The goal of a distributed operation is to support the operational commander in the field; it is not a method of command from the rear. (AFDD 2-8)

electronic intelligence. Technical and geolocation intelligence derived from foreign non-communications electromagnetic radiations emanating from other than nuclear detonations or radioactive sources. Also called **ELINT**. (JP 1-02)

essential elements of information. The most critical information requirements regarding the adversary and the environment needed by the commander by a particular time to relate with other available information and intelligence in order to assist in reaching a logical decision. Also called **EEI**. (JP 1-02)

estimate. 1. An analysis of a foreign situation, development, or trend that identifies its major elements, interprets the significance, and appraises the future possibilities and the prospective results of the various actions that might be taken. 2. An appraisal of the capabilities, vulnerabilities, and potential courses of action of a foreign nation or combination of nations in consequence of a specific national plan, policy, decision, or contemplated course of action. 3. An analysis of an actual or contemplated clandestine operation in relation to the situation in which it is or would be conducted in order to identify and appraise such factors as available as well as needed assets and potential obstacles, accomplishments, and consequences. See also **intelligence estimate.** (JP 1-02)

evaluation and feedback. In intelligence usage, continuous assessment of intelligence operations throughout the intelligence process to ensure that the commander's intelligence requirements are being met. See **intelligence process**. (JP 1-02)

exploitation. Taking full advantage of success in military operations, following up initial gains, and making permanent the temporary effects already achieved.

2. Taking full advantage of any information that has come to hand for tactical, operational, or strategic purposes. 3. An offensive operation that usually follows a successful attack and is designed to disorganize the enemy in depth. See also attack; pursuit. (JP 1-02)

foreign instrumentation signals intelligence. Technical information and intelligence derived from the intercept of foreign electromagnetic emissions associated with the testing and operational deployment of non-US aerospace, surface, and subsurface systems. Foreign instrumentation signals intelligence is a subcategory of signals intelligence. Foreign instrumentation signals include but are not limited to telemetry, beaconry, electronic interrogators, and video data links. Also called **FISINT**. (JP 1-02)

fusion. In intelligence usage, the process of examining all sources of intelligence and information to derive a complete assessment of activity. (JP 1-02)

general military intelligence. Intelligence concerning the (1) military capabilities of foreign countries or organizations or (2) topics affecting potential US or multinational military operations, relating to the following subjects: armed forces capabilities, including order of battle, organization, training, tactics, doctrine, strategy, and other factors bearing on military strength and effectiveness; area and terrain intelligence, including urban areas, coasts and landing beaches, and meteorological, oceanographic, and geological intelligence; transportation in all modes; military materiel production and support industries; military and civilian command, control, communications, computers, and intelligence systems; military economics, including foreign military assistance; insurgency and terrorism; military-political-sociological intelligence; location, identification, and description of military-related installations; government control; escape and evasion; and threats and forecasts. (Excludes scientific and technical intelligence.) Also called **GMI**. (JP 1-02)

geospatial intelligence. The exploitation and analysis of imagery and geospatial information to describe, assess, and visually depict physical features and geographically referenced activities on the Earth. Also called **GEOINT**. (GEOINT Publication 1)

human intelligence. (DOD, NATO) A category of intelligence derived from information collected and provided by human sources. Also called **HUMINT**. See also human resources intelligence.(JP 1-02)

imagery. Collectively, the representations of objects reproduced electronically or by optical means on film, electronic display devices, or other media. (JP 1-02)

indications and warning. Those intelligence activities intended to detect and report time-sensitive intelligence information on foreign developments that could involve a threat to the United States or allied military, political, or economic

interests or to US citizens abroad. It includes forewarning of enemy actions or intentions; the imminence of hostilities; insurgency; nuclear/non-nuclear attack on the United States, its overseas forces, or allied nations; hostile reactions to the United States reconnaissance activities; terrorists' attacks; and other similar events. Also called **I&W**. (JP 1-02)

information. 1. Facts, data, or instructions in any medium or form. 2. The meaning that a human assigns to data by means of the known conventions used in their representation. (JP 1-02)

information requirements. Those items of information regarding the enemy and his environment which need to be collected and processed in order to meet the intelligence requirements of a commander. (JP 1-02)

infrared imagery. That imagery produced as a result of sensing electromagnetic radiations emitted or reflected from a given target surface in the infrared position of the electromagnetic spectrum (approximately 0.72 to 1,000 microns).
(JP 1-02)

intelligence. 1. The product resulting from the collection, processing, integration, analysis, evaluation, and interpretation of available information concerning foreign countries or areas. 2. Information and knowledge about an adversary obtained through observation, investigation, analysis, or understanding.
(JP 1-02)

intelligence federation. A formal agreement in which a combatant command joint intelligence center receives preplanned intelligence support from other joint intelligence centers, Service intelligence organizations, Reserve organizations, and national agencies during crisis or contingency operations. (JP 1-02)

intelligence process. The process by which information is converted into intelligence and made available to users. The process consists of six interrelated intelligence operations: planning and direction, collection, processing and exploitation, analysis and production, dissemination and integration, and evaluation and feedback. See also analysis and production; collection; dissemination and integration; evaluation and feedback; intelligence; planning and direction; processing and exploitation. (JP 1-02)

intelligence preparation of the operational environment. An analytical methodology employed to reduce uncertainties concerning the enemy, environment, and terrain for all types of operations. Intelligence preparation of the operational environment builds an extensive data base for each potential area in which a unit may be required to operate. The database is then analyzed in detail to determine the impact of the enemy, environment, and terrain on operations and presents it in graphic form. Intelligence preparation of the operational environment is a continuing process. Also called **IPOE**. (JP 1-02)

intelligence requirement. Any subject, general or specific, upon which there is a need for the collection of information, or the production of intelligence. (JP 1-02)

intelligence summary. A specific report providing a summary of items of intelligence at frequent intervals. Also called **INTSUM**. (JP 1-02)

intelligence, surveillance, and reconnaissance. An activity that synchronizes and integrates the planning and operation of sensors, assets, and processing, exploitation, and dissemination systems in direct support of current and future operations. This is an integrated intelligence and operations function. Also called **ISR**. (JP 1-02)

interoperability. 1. The ability of systems, units, or forces to provide services to and accept services from other systems, units, or forces and to use the services so exchanged to enable them to operate effectively together. (JP 1-02)

interpretation. A stage in the intelligence cycle in which the significance of information is judged in relation to the current body of knowledge. (JP 1-02)

joint force. A general term applied to a force composed of significant elements, assigned or attached, of two or more Military Departments, operating under a single joint force commander. See also **joint force commander**. (JP 1-02)

joint force air component commander. The joint force air component commander derives authority from the joint force commander who has the authority to exercise operational control, assign missions, direct coordination among subordinate commanders, redirect and organize forces to ensure unity of effort in the accomplishment of the overall mission. The joint force commander will normally designate a joint force air component commander. The joint force air component commander's responsibilities will be assigned by the joint force commander (normally these would include, but not be limited to, planning, coordination, allocation, and tasking based on the joint force commander's apportionment decision). Using the joint force commander's guidance and authority, and in coordination with other Service component commanders and other assigned or supporting commanders, the joint force air component commander will recommend to the joint force commander apportionment of air sorties to various missions or geographic areas. Also called **JFACC**. See also **joint force commander**. (JP 1-02) [*The joint force air and space component commander (JFACC) uses the joint air and space operations center to command and control the integrated air and space effort to meet the joint force commander's objectives. This title emphasizes the Air Force position that air power and space power together create effects that cannot be achieved through air or space power alone.*] [AFDD 2] {Italicized words in brackets apply only to the Air Force and are offered for clarity.}

joint force commander. A general term applied to a combatant commander, subunified commander, or joint task force commander authorized to exercise combatant command (command authority) or operational control over a joint force. Also called **JFC**. See also **joint force**. (JP 1-02)

joint task force. A joint force that is constituted and so designated by the Secretary of Defense, a combatant commander, a subunified commander, or an existing joint task force commander. Also called **JTF**. (JP 1-02)

measurement and signature intelligence. Technically derived intelligence that detects, locates, tracks, identifies, and describes the unique characteristics of fixed and dynamic target sources. Measurement and signature intelligence capabilities include radar, laser, optical, infrared, acoustic, nuclear radiation, radio frequency, spectroradiometric, and seismic sensing systems as well as gas, liquid, and solid materials sampling and analysis. Also called **MASINT**. (JP 1-02)

monitoring. The act of listening, carrying out surveillance on, and/or recording of enemy emissions for intelligence purposes. (JP 1-02)

national intelligence support team. A nationally sourced team composed of intelligence and communications experts from either Defense Intelligence Agency, Central Intelligence Agency, National Security Agency, or any combination of these agencies. Also called **NIST**. (JP 1-02)

near-real time. Pertaining to the timeliness of data or information which has been delayed by the time required for electronic communication and automatic data processing. This implies that there are no significant delays. Also called **NRT**. See also **real time**. (JP 1-02)

open-source intelligence. Information of potential intelligence value that is available to the general public. Also called **OSINT**. (JP 1-02)

operational control. Transferable command authority that may be exercised by commanders at any echelon at or below the level of combatant command. Operational control is inherent in combatant command (command authority). Operational control may be delegated and is the authority to perform those functions of command over subordinate forces involving organizing and employing commands and forces, assigning tasks, designating objectives, and giving authoritative direction necessary to accomplish the mission. Operational control includes authoritative direction over all aspects of military operations and joint training necessary to accomplish missions assigned to the command. Operational control should be exercised through the commanders of subordinate organizations. Normally this authority is exercised through subordinate joint force commanders and Service and/or functional component commanders.

Operational control normally provides full authority to organize commands and forces and to employ those forces as the commander in operational control considers necessary to accomplish assigned missions. Operational control does not, in and of itself, include authoritative direction for logistics or matters of administration, discipline, internal organization, or unit training. Also called **OPCON**. (JP 1-02)

operational environment. A composite of the conditions, circumstances, and influences that affect the employment of capabilities and bear on the decisions of the commander. (JP 1-02)

operational intelligence. Intelligence that is required for planning and conducting campaigns and major operations to accomplish strategic objectives within theaters or operational areas. See also **intelligence**; **strategic intelligence**; **tactical intelligence**. (JP 1-02)

planning and direction. In intelligence usage, the determination of intelligence requirements, development of appropriate intelligence architecture, preparation of a collection plan, and issuance of orders and requests to information collection agencies. See also intelligence process. (JP 1-02)

priority intelligence requirements. Those intelligence requirements for which a commander has an anticipated and stated priority in the task of planning and decision making. Also called **PIR**. See also information requirements; intelligence; intelligence process; intelligence requirement. (JP 1-02)

processing and exploitation. In intelligence usage, the conversion of collected information into forms suitable to the production of intelligence (JP 2-01)

radar imagery. Imagery produced by recording radar waves reflected from a given target surface. (JP 1-02)

reachback. The process of obtaining products, services, and applications, or forces, equipment, or material from Air Force organizations that are not forward deployed. (AFDD 2)

real time. Pertaining to the timeliness of data or information which has been delayed only by the time required for electronic communication. This implies that there are no noticeable delays. See also **near-real time**. (JP 1-02)

reconnaissance. A mission undertaken to obtain, by visual observation or other detection methods, information about the activities and resources of an enemy or potential enemy, or to secure data concerning the meteorological, hydrographic, or geographic characteristics of a particular area. Also called **RECON**. (JP 1-02) [*A transitory mission undertaken to obtain, by visual observation or other detection methods, information about the activities and resources of an*

adversary or potential adversary, or to secure data concerning the meteorological, hydrographic, or geographic characteristics of a particular area.] (AFDD 2-9) {Italicized definition in brackets applies only to the Air Force and is offered for clarity.}

request for information. 1. Any specific time-sensitive ad hoc requirement for intelligence information or products to support an ongoing crisis or operation not necessarily related to standing requirements or scheduled intelligence production. A request for information can be initiated to respond to operational requirements and will be validated in accordance with the theater command's procedures. 2. The National Security Agency/Central Security Service uses this term to state ad hoc signals intelligence requirements. Also called **RFI**. See also information; intelligence. (JP 1-02)

scientific and technical intelligence. The product resulting from the collection, evaluation, analysis, and interpretation of foreign scientific and technical information that covers: a. foreign developments in basic and applied research and in applied engineering techniques; and b. scientific and technical characteristics, capabilities, and limitations of all foreign military systems, weapons, weapon systems, and materiel; the research and development related thereto; and the production methods employed for their manufacture. Also called **S&TI**. (JP 1-02)

sensor. An equipment which detects, and may indicate, and/or record objects and activities by means of energy or particles emitted, reflected, or modified by objects. (JP 1-02)

SIGINT operational tasking authority. A military commander's authority to operationally direct and levy signals intelligence (SIGINT) requirements on designated SIGINT resources; includes authority to deploy and redeploy all or part of the SIGINT resources for which SIGINT operational tasking authority has been delegated. Also called **SOTA**. (JP 1-02, DODD 5100.20)

signals intelligence. 1. A category of intelligence comprising either individually or in combination all communications intelligence, electronic intelligence, and foreign instrumentation signals intelligence, however transmitted. 2. Intelligence derived from communications, electronic, and foreign instrumentation signals. Also called **SIGINT**. (JP 1-02)

special operations. Operations conducted in hostile, denied, or politically sensitive environments to achieve military, diplomatic, informational, and/or economic objectives employing military capabilities for which there is no broad conventional force requirement. These operations often require covert, clandestine, or low visibility capabilities. Special operations are applicable across the range of military operations. They can be conducted independently or in conjunction with operations of conventional forces or other government agencies

and may include operations through, with, or by indigenous or surrogate forces. Special operations differ from conventional operations in degree of physical and political risk, operational techniques, mode of employment, independence from friendly support, and dependence on detailed operational intelligence and indigenous assets. Also called **SO**. (JP 1-02)

surveillance. The systematic observation of aerospace, surface, or subsurface areas, places, persons, or things, by visual, aural, electronic, photographic, or other means. (JP 1-02)

tactical control. Command authority over assigned or attached forces or commands, or military capability or forces made available for tasking, that is limited to the detailed and, usually, local direction and control of movements or maneuvers necessary to accomplish missions or tasks assigned. Tactical control is inherent in operational control. Tactical control may be delegated to, and exercised at any level at or below the level of combatant command. Also called **TACON**. (JP 1-02)

target. 1. A geographical area, complex, or installation planned for capture or destruction by military forces. 2. In intelligence usage, a country, area, installation, agency, or person against which intelligence operations are directed. (JP 1-02)

targeting. The process of selecting targets and matching the appropriate response to them, taking account of operational requirements and capabilities. (JP 1-02)

technical intelligence. Intelligence derived from exploitation of foreign material, produced for strategic, operational, and tactical level commanders. Technical intelligence begins when an individual service member finds something new on the battlefield and takes the proper steps to report it. The item is then exploited at succeedingly higher levels until a countermeasure is produced to neutralize the adversary's technological advantage. Also called **TECHINT**. See also exploitation; intelligence.

validation. A process associated with the collection and production of intelligence that confirms that an intelligence collection or production requirement is sufficiently important to justify the dedication of intelligence resources, does not duplicate an existing requirement, and has not been previously satisfied. 2. In computer modeling and simulation, the process of determining the degree to which a model or simulation is an accurate representation of the real world from the perspective of the intended uses of the model or simulation. 3. Execution procedure used by combatant command components, supporting combatant commanders, and providing organizations to confirm to the supported commander and US Transportation Command that all the information records in a time-phased force and deployment data not only are error free for automation purposes, but also accurately reflect the current status, attributes, and availability of units and requirements. Unit readiness, movement dates, passengers, and

cargo details should be confirmed with the unit before validation occurs. See also **independent review; time-phased force and deployment data; verification**. (JP 1-02)

To Our Readers

Changes: Readers of this publication are encouraged to submit suggestions and changes that will improve it. Recommendations may be sent directly to Commanding General, Marine Corps Combat Development Command, Doctrine Division (C 42), 3300 Russell Road, Suite 318A, Quantico, VA 22134-5021 or by fax to 703-784-2917 (DSN 278-2917) or by E-mail to **morgann@mccdc.usmc.mil**. Recommendations should include the following information:

- Location of change
  - Publication number and title
  - Current page number
  - Paragraph number (if applicable)
  - Line number
  - Figure or table number (if applicable)
- Nature of change
  - Add, delete
  - Proposed new text, preferably double-spaced and typewritten
- Justification and/or source of change

Additional copies: A printed copy of this publication may be obtained from Marine Corps Logistics Base, Albany, GA 31704-5001, by following the instructions in MCBul 5600, *Marine Corps Doctrinal Publications Status.* An electronic copy may be obtained from the Doctrine Division, MCCDC, world wide web home page which is found at the following universal reference locator: **http://www.doctrine.usmc.mil**.

Unless otherwise stated, whenever the masculine gender is used, both men and women are included.

FOREWORD

Marine Corps Doctrinal Publication 2, *Intelligence,* and Marine Corps Warfighting Publication 2-1, *Intelligence Operations*, provide doctrine and tactics, techniques, and procedures for intelligence operations. Marine Corps Warfighting Publication (MCWP) 2-4 *Marine Air-Ground Task Force Intelligence Dissemination*, complements and expands upon this information by detailing specific doctrine, tactics, techniques, and procedures for conducting intelligence dissemination in support of the Marine air-ground task force (MAGTF). The primary target audience of this publication is intelligence personnel responsible for planning and executing intelligence dissemination operations, as well as personnel who provide support to intelligence dissemination or who use results from intelligence operations.

MCWP 2-4 describes aspects of intelligence dissemination operations including doctrinal fundamentals, responsibilities, management, methodology and planning, and common forms of dissemination, such as estimates, studies, briefings, and reports. MCWP 2-4 provides the information needed by Marines to understand, plan, and execute intelligence dissemination operations in support of the MAGTF across the range of military operations.

Reviewed and approved this date.

MARINE AIR-GROUND TASK FORCE INTELLIGENCE DISSEMINATION

TABLE OF CONTENTS

Chapter 1. Intelligence Dissemination Overview

Objective 1-1
Communications and Information System Factors 1-1
Intelligence Dissemination Capabilities and Challenges 1-2
- Dissemation Assets 1-2
- Internal Dissemination 1-2
- External Dissemination 1-2
- Major Subordinate Command Level and Below 1-2

Responsibilities 1-2
Dissemination Guidelines 1-3
Intelligence Dissemination and Intelligence Functions 1-3
Intelligence Dissemination within the Intelligence Cycle 1-4
Intelligence Dissemination Criteria 1-4
- Pertinence 1-4
- Usability of Form 1-5
- Timeliness 1-5

CHAPTER 1
INTELLIGENCE DISSEMINATION OVERVIEW

Intelligence dissemination is the delivery of intelligence to users in a suitable form. (Marine Corps Warfighting Publication [MCWP] 2-1, *MAGTF Intelligence Operations*) Successful Marine air-ground task force (MAGTF) intelligence dissemination reduces uncertainty and provides knowledge to battlefield decisionmakers when and where required. Dissemination management involves establishing dissemination priorities, selection of dissemination means, and monitoring the flow of intelligence throughout the command. (Marine Corps Reference Publication [MCRP] 5-12C, *Marine Corps Supplement to the Department of Defense Dictionary of Military and Associated Terms*)

Objective

Dissemination management involves dissemination priorities, selection of dissemination means, and monitoring the flow of intelligence throughout the command. The objective of dissemination management is to deliver the required intelligence to the appropriate user in the proper form at the right time, while ensuring that individual consumers and the dissemination system are not overloaded by attempting to move unneeded or irrelevant information. Dissemination management also provides for the use of security controls, which do not impede the timely delivery or subsequent use of intelligence, while protecting intelligence sources and methods. (MCRP 5-12C)

Communications and Information System Factors

The MAGTF must ensure that sufficient communications and information systems (CIS) connectivity, with supporting intelligence resources, are integrated throughout the MAGTF staff intelligence element (G-2/S-2), and within the MAGTF's command and control (C2) structure. All sources of intelligence pertinent to the MAGTF's assigned mission(s) must be identified, quickly retrieved, processed, tailored to the supported requirement, and made available to planners and decisionmakers at all MAGTF echelons in sufficient time to be of value in their operations.

The fielding of numerous operational and intelligence-related automated systems and the challenges of joint, combined, and multinational operations make MAGTF intelligence dissemination a complicated endeavor. The MAGTF CIS architecture must link production with supported commanders. In addition to transmitting imagery and other intelligence products with large data files, the dissemination requirement includes the capability to disseminate sensitive compartmented information (SCI), and general service (GENSER) reports digitally via fiber-optics, wire or radio formats; and the capability to disseminate intelligence in voice formats.

Key MAGTF CIS resources include the following:

- Tactical data network (TDN).
- Nonsecure Internet Protocol Router Network (NIPRNET).
- SECRET Internet Protocol Router Network (SIPRNET).
- Defense Switched Network (DSN).
- Defense Secure Network (DSNET).
- Joint Worldwide Intelligence Communications System (JWICS).
- Intelligence analysis system (IAS).
- Command and control personal computer (C2PC).
- Intelligence operations workstation (IOW).

- Joint deployable intelligence support system (JDISS).
- Satellite communications (SATCOM).

For detailed descriptions of MAGTF CIS, see MCWP 3-40.3, *Communications and Information Systems*.

Intelligence Dissemination Capabilities and Challenges

Dissemination Assets

The intelligence battalion collection management and dissemination section provides the core C2 for Marine Expeditionary Force (MEF) intelligence dissemination operations by developing and coordinating the dissemination plan and reporting criteria. The surveillance and reconnaissance cell (SARC) executes reporting criteria. The production and analysis (P&A) cell receives collected intelligence data and information, analyzes it, produces intelligence products, and executes dissemination criteria. Key CIS resources required include IAS and JDISS, with access to the full range of MAGTF communications (JWICS, SIPRNET, NIPRNET or DSN) for external dissemination; and IAS via the TDN and other MAGTF communications resources for internal dissemination.

Internal Dissemination

The IAS, the IOW, and MAGTF TDN are the key tools for electronic dissemination between the command element (CE) and major subordinate commands (MSCs). Communications connectivity between the MAGTF CE and its major subordinate element (MSE) headquarters are predominantly provided by SATCOM, supplemented where practical with high frequency/ultra high frequency (UHF) radios, troposcatter multichannel radio systems, telephone systems, and couriers. IAS will be available at all command echelons down to the maneuver bn/squadron levels.

External Dissemination

The MAGTF CE will attempt to exploit all available external capabilities (national, theater or joint) to satisfy its intelligence requirements (IRs). Intelligence agencies and Department of Defense (DOD) organizations have varying connectivity and procedural requirements. These may be planned for and coordinated through the joint staff intelligence element (J-2) and the joint CIS staff element (J-6) or the Marine Corps forces (MARFOR) headquarters (HQ).

Major Subordinate Command Level and Below

Connectivity at the MSC level and below is principally via the TDN, single-channel radio, multichannel radio, telephone, and courier. Communications connectivity below the regiment/group level depends on a combination of tactical data systems and single channel radio. The ability to exchange data traffic may be limited due to the availability of bandwidth.

Responsibilities

Meeting MAGTF intelligence dissemination requirements requires extensive planning, coordination, situational awareness, flexibility, and perseverance. The CIS officer's focus is on providing the necessary communication channels, interfaces, and media necessary to move intelligence throughout the MAGTF, and to lateral elements and higher echelons. The intelligence officer remains focused on the employment of allocated CIS resources that support intelligence dissemination requirements while maintaining close coordination with the operations officer to monitor current and future operational missions and requirements.

Intelligence officers at every level of the MAGTF have dissemination responsibilities. At the MEF level, the intelligence battalion directs intelligence dissemination operations. The intelligence battalion commander/intelligence support coordinator (ISC) has principal staff responsibility for the dissemination architecture. The intelligence battalion commander is dual-hatted as the ISC. The collection management/dissemination officer (CM/DO) plays a key role in ensuring intel dissemination.

The CM/DO is sourced from the intelligence battalion's S-3 section. The CM/DO is responsible for the following:

- Formulating detailed intelligence collection requirements (ICRs) and intelligence dissemination requirements (IDRs) and tasking and coordinating internal and external operations to satisfy these.
- Receiving validated priority intelligence requirements (PIRs) and IRs and direction from the ISC, and then planning and managing the best methods to employ organic and supporting collection and dissemination resources through the intelligence collection and dissemination plans.
- Validating and forwarding MEF and MSC requests for national and theater collection and dissemination support using appropriate intelligence tools and procedures.
- Coordinating intelligence-related CIS requirements and maintaining awareness of available CIS connectivity throughout the MAGTF and with key external organizations.

The CIS officer (G-6/S-6) is responsible for the management and functioning of MAGTF CIS circuits, such as MEF radio nets and SIPRNET connectivity. The G-2/S-2 is responsible for the management and maintenance of dedicated intelligence systems. Regardless of the status of CIS support, the intelligence officer is responsible for the timely dissemination of critical intelligence.

Dissemination Guidelines

Guidelines for intelligence dissemination include the following:

- Dissemination formats; either verbal, text or graphical.
- Whether verbal, text or graphic, intelligence products should use standard formats whenever possible to facilitate ease of preparation, usability, and dissemination.
- Transmission can be either hardcopy or electronic, regardless of the format.
- Dissemination of too few or too many intelligence products can adversely affect operations.
- Intelligence dissemination requires sound judgment when applying information management techniques.
- Effective intelligence dissemination requires that intelligence personnel be aware of enemy capabilities and probable courses of action (COAs), as well as friendly missions, the commander's intent, and the concepts of operations.
- Successful MAGTF intelligence dissemination requires planning, management, and flexibility.
- Executing intelligence dissemination requires knowledge of manual and automated dissemination means available to the MAGTF.

Intelligence Dissemination and Intelligence Functions

MAGTF intelligence dissemination must support the following six specific intelligence functions:

- Support to the commander's estimate.
- Situation development.
- Indications and warning (I&W).
- Support to force protection.
- Support to targeting.
- Support to combat assessment.

Intelligence Dissemination within the Intelligence Cycle

The process used to develop intelligence is called the intelligence cycle (see fig. 1-1). The intelligence cycle consists of six sequential yet interdependent steps: planning and direction; collection; processing and exploitation; production; dissemination; and utilization. While consistent with the joint intelligence cycle, the Marine Corps cycle emphasizes the importance of intelligence utilization. MAGTF intelligence dissemination must be planned for and supervised to the same degree as direction, collection, processing, and production to ensure that intelligence operations are successful.

Intelligence Dissemination Criteria

The following criteria determine how well disseminated intelligence contributes to tactical success:

- Pertinence.
- Usability of form.
- Timeliness.
- Security.

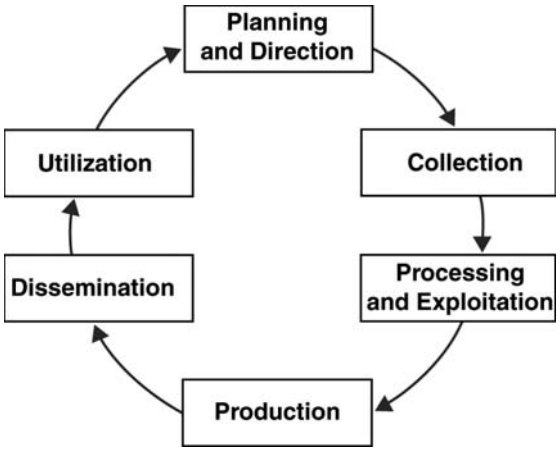

Figure 1-1. The Marine Corps Intelligence Cycle.

Pertinence

The dissemination system must provide the flexibility to use a supply-push system (which pushes important or time-sensitive intelligence directly to users), while also permitting users to demand-pull (allowing users to access information) relevant intelligence as needed from readily accessible sources, such as a database or a watch section at an intelligence center. The following principles guide successful dissemination of pertinent intelligence:

- *Relevant intelligence must be disseminated to all units or agencies that require it.* Intelligence must be tailored to the needs of the commander. Stated requirements are a minimum, and often change. Aggressive management of the dissemination strategy, a thorough understanding of user needs, sound judgment, and continuous monitoring of the dissemination architecture are required. Tactical judgment is important to disseminate pertinent intelligence to affected users, whether a requirement for it is a stated requirement or not.
- *Disseminate critical information and intelligence.* Disseminate intelligence, not simply information, to supported decisionmakers. However, because of its highly perishable or critical nature, combat data (derived from reporting by operational units) and sensor data may be disseminated without being converted into intelligence. Caution is required since warnings and combat and sensor data may later be explained in ways other than reflected in the original report. Additionally, this type of information has the potential to be over-disseminated. Operational rules of engagement must match the command's time-sensitive targeting policy.
- *Crisis situations may preclude some or all of the normal filtering process.* Filtering is a responsibility shared among intelligence collectors, producers, and disseminators, as well as among intelligence and other warfighting

personnel. When time-sensitive crisis situations preclude deliberate intelligence processing and necessitate dissemination of untailored intelligence or unevaluated information, intelligence personnel must ensure that tactical commanders are aware that they are receiving unevaluated intelligence.

- *Dissemination downward should be selective and well planned.* Units should not receive irrelevant intelligence or voluminous amounts of information that can tie up their communication channels or overload their organic analytical capability. This is especially valid in the case of dissemination to lower tactical units whose capabilities for processing and producing information are limited. However, broad dissemination that results in the occasional delivery of intelligence to a non pertinent unit preferable to selective dissemination in which units may fail to receive available intelligence when they need it.

Usability of Form

Disseminated intelligence must be in a form suitable for immediate use by the recipient and should be tailored for the intended consumer. Standard formats for intelligence products—such as the intelligence estimate, intelligence studies, briefings, and reports—must be established, understood, and used by intelligence personnel and users. Basic MAGTF intelligence products have established formats. Individual units may modify formats if necessary, but modifications must be thoroughly coordinated as they may impact interoperability. Intelligence personnel should complement textual data with graphics when appropriate. Forms of dissemination include the following:

- *Written documents.* Intelligence estimates, operation plan/operation order (OPLAN/OPORD) annexes, studies, and reports are useful for general dissemination of large amounts of intelligence to many users—particularly within larger organizations when time is not critical and when deliberate planning is possible—and for all organizations in support of specified wartime contingency planning.
- *Messages.* Textual and voice messages may be effective for either routine or time-critical situations, particularly if restricted to a single intelligence subject, issue or action. It is important, however, that formats be standardized and understood by all—particularly if abbreviations or codes are used to aid with brevity.
- *Oral briefings.* Oral briefings, especially when built around a situation map and focused supporting graphics and imagery, are often used during deliberate and rapid planning and are the norm for intelligence dissemination to the immediate commander and his staff.
- *Electronic dissemination.* Automated technologies, including web-based technologies and information systems, are advancing opportunities for intelligence personnel at all command echelons to employ capabilities such as demand-pull, video-teleconferencing, and enhanced graphical techniques to access intelligence community resources.

Timeliness

Intelligence must be disseminated in time to influence planning, decisionmaking, and execution. Rapid dissemination of critical, time-sensitive intelligence is particularly vital. The commander's intent and the commander's critical intelligence requirements (CCIRs) guide the intelligence staff in identifying PIRs and anticipating future IRs. Many factors influence the timeliness of disseminated intelligence, including the following:

- Date desired is the date-time-group of when the requester requires the intelligence product and is a key dissemination planning factor.
- Latest time intelligence is of value (LTIOV) should be designated in cases where the value of intelligence collection would still be of use even if received after the specified date desired. LTIOVs should be written into PIRs for incorporation into dissemination operations planning and management.

- A high volume of intelligence reporting can degrade the performance of available intelligence communication networks and overwhelm scarce analytical resources.
- Distance, mobility, and terrain factors often limit available CIS options, such as automated wide-area networks (WANs), thereby increasing reliance upon less effective single channel radio and courier methods.
- The communications means available.
- The need to reformat certain intelligence products into user-friendly formats prior to dissemination.
- A heightened tempo that usually produces a greater quantity of IRs and customers.
- Hardware and software requirements that may pose interoperability or security problems, especially in joint or multinational operations.

The timeliness of intelligence dissemination may be improved by—

- Assigning priorities to intelligence requiring dissemination.
- Targeting specific recipients for each intelligence product.
- Reducing volume.
- Developing well-defined procedures.
- Training.

Security

Transmitting intelligence securely precludes the enemy from ascertaining MAGTF intelligence sources, estimating the effectiveness of MAGTF intelligence operations, and altering his actions or strengthening his counterintelligence (CI) efforts. Secure intelligence dissemination must be planned for and integrated with all command security programs: operations, information, communications, personnel, and physical security. Intelligence can be disseminated by any system available that provides adequate information security.

Secure dissemination methods must be used whenever possible. However, if the situation and intelligence are time-sensitive, intelligence may be disseminated via any available means. In such cases, the unit security manager and intelligence officer are immediately informed and will assess any possible damage and initiate necessary remedial corrective actions.

The majority of today's tactical CIS have integral or supporting features that provide security protection. For more restricted operational or SCI communications, detailed procedures exist that allow for sanitization and timely, broader dissemination when necessary. The principal security challenge that may be faced during tactical or crisis situations is when events occur that disrupt or degrade these unit CIS, necessitating a potential trade-off between security and dissemination. Multilateral operations raise additional dissemination challenges regarding the sharing of intelligence among allied and coalition forces.

Tailored intelligence will be disseminated via the best means available consistent with the operational situation. Although most intelligence will be classified, even some unclassified intelligence may require security protection due to operational security considerations. Resolving these challenges will be situationally dependent. Relevant factors to consider include the following:

- The enemy's own intelligence collection, processing, and dissemination capabilities.
- Phase of the operation's planning or execution.
- Significance of current intelligence gaps, particularly at lower tactical units.
- How the intelligence may support the exploitation of threat vulnerabilities and tactical opportunities.

CHAPTER 2
INTELLIGENCE DISSEMINATION MANAGEMENT

Dissemination management ensures that the required intelligence is provided to the appropriate user in the proper form and at the right time.

Dissemination Management Functions

The two distinct functions within dissemination management are dissemination requirements management, and dissemination operations management. Dissemination requirements management defines what intelligence will be disseminated and who needs it; dissemination operations management specifies how the intelligence will be disseminated. Management of dissemination requirements and operations is performed at all levels of the MAGTF. Within the MEF, management is coordinated by the intelligence battalion in accordance with the direction of the MEF intelligence officer.

Dissemination Requirements Management

Managing intelligence requirements is the first step in dissemination planning. Intelligence collection, production, and dissemination all flow from an integrated intelligence planning and direction process that is built upon IR management. Each IR will generally have an associated ICR, intelligence production requirement (IPR), and IDR. (See fig. 2-1) See also MCWP 2-1.

Dissemination requirements management is framed by the dissemination strategy, which incorporates commander's intent, CCIRs, PIRs, IRs,

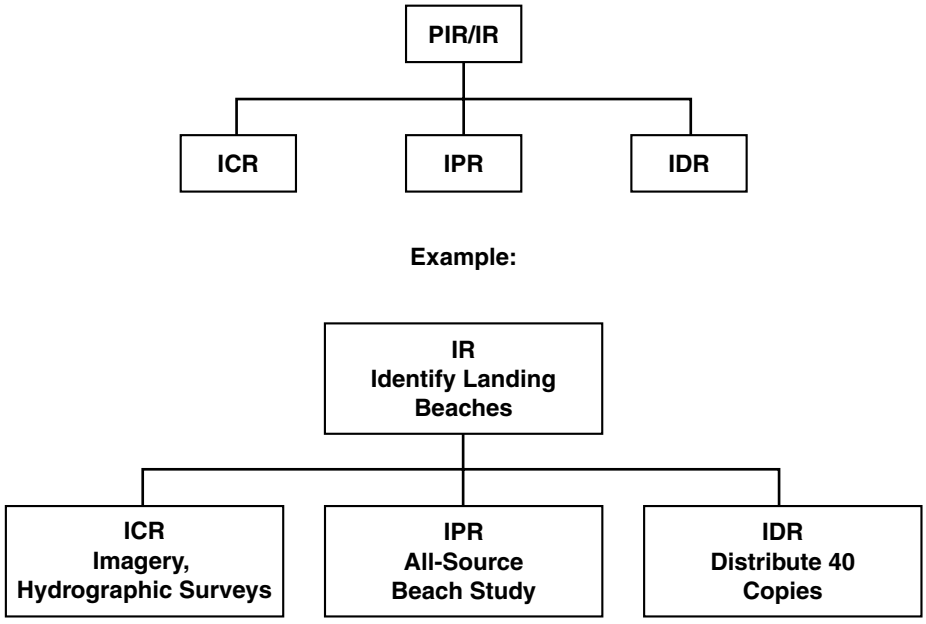

Figure 2-1. Requirements Satisfaction.

concepts of operation, and requests for information (RFIs). A preplanned dissemination strategy familiarizes the MAGTF with which intelligence products will be disseminated and by what means. It also describes alternate means of dissemination.

Dissemination Operations Management

Dissemination operations are managed by using a combination of methods (supply-push and demand-pull), channels (standard and alarm), modes (broadcast and point-to-point), and forms (verbal, text, and graphic) to convey the product to users.

Intelligence Dissemination Means

The ability to deliver tailored intelligence products and support to the right people in a timely manner is a direct result of the means of dissemination available. Within the MAGTF, no single way of disseminating will be satisfactory for all recipients and for all situations.

A combination of methods, channels, modes, and forms are planned, managed, and employed to accomplish the intelligence dissemination goal. These will vary according to the following:

- Situation.
- Location of the recipient.
- Urgency of the intelligence.
- Complexity or nature of the intelligence.
- Disseminating and receiving intelligence sections' capabilities.
- Available dissemination means.

Dissemination Methods

The two basic methods used to disseminate intelligence are supply-push and demand-pull. Intelligence planners must develop and implement intelligence dissemination plans with the flexibility to exploit either methodology, pushing time-sensitive intelligence directly to users while simultaneously allowing them to pull other intelligence products as needed.

The supply-push method disseminates intelligence to users as it becomes available (or on a schedule) from an intelligence collector or producer. This method is need-driven and is triggered by the availability of required intelligence and an understanding of its need by specific users.

The demand-pull method exploits technological improvements by giving users either direct electronic access to intelligence databases, files, servers or intelligence products through detailed search procedures or via direct queries to intelligence planners and producers, such as the MEF's P&A cell or the joint intelligence center (JIC).

Demand-pull dissemination is primarily used when there is a need by a subordinate command to access intelligence archives at higher HQ, such as databases and technical files maintained at JIC and the P&A cell for amplifying intelligence to support its planning activities (for example, basic/descriptive intelligence, technical information). It may also be employed by higher echelons to satisfy IRs when the amplifying data can best be accessed from subordinate units.

Dissemination Channels

Intelligence is disseminated using two types of channels: standard and alarm (see fig. 2-2).

Standard Channel

Standard channel dissemination consists of transmission of intelligence according to a set order and format. It is used for routine intelligence dissemination and is the channel used for the majority of dissemination requirements. Dissemination generally occurs on a regular schedule or intervals. Examples of standard intelligence dissemination include studies,

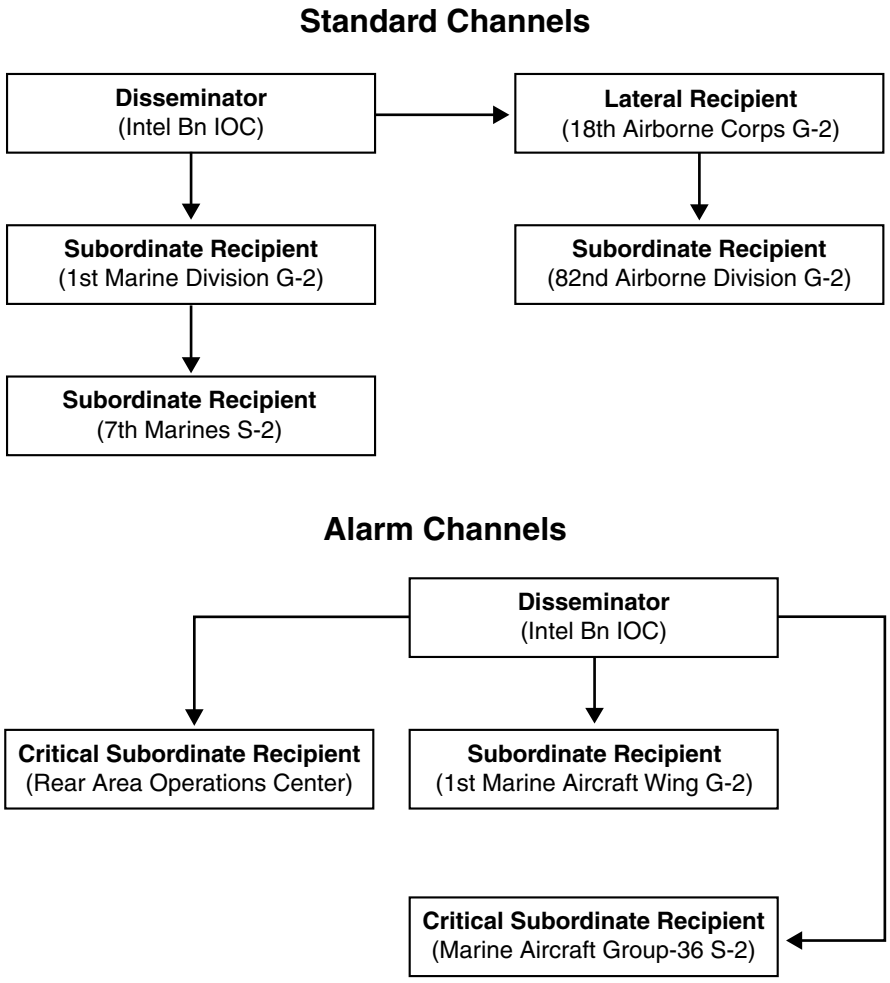

Figure 2-2. Intelligence Dissemination Channels.

reports, routine message intelligence summaries, and formal staff briefings. Standard dissemination employs normal MAGTF command and staff channels and supporting CIS.

Alarm Channel

Alarm channel dissemination is used for critical, time-sensitive intelligence that can have an immediate effect on operations. This type of dissemination has no set format or schedule and is activated only when critical intelligence is received that requires immediate decision or action. When an alarm-triggering event occurs, intelligence must go to the units or sections most affected by the most direct means possible, even if it means skipping echelons of command. CIS connectivity may be either the standard MAGTF CIS architecture or by dedicated intelligence CIS. Because alarm intelligence is time-sensitive, dissemination should include a means for verifying receipt and understanding. Filters and thresholds for alarm-triggering events must be developed, understood, and practiced in advance. Effectively disseminating intelligence via alarm channels requires the following:

- Detailed intelligence collection, production, and reporting direction.

- Accurate knowledge of MAGTF CIS.
- Frequent interoperability training (to include other Service and joint organizations).
- Training for intelligence, operations and unit personnel to immediately recognize, act upon received intelligence, and disseminate it.

Dissemination Modes

Intelligence is disseminated via broadcast or point-to-point modes (see fig. 2-3).

Broadcast Mode

When using the broadcast mode, intelligence that affects the majority of units is disseminated simultaneously to a broad audience. Examples include dissemination of the initial MAGTF intelligence estimate or an I&W report of an enemy surface-to-surface missile launch. Successful use of broadcast modes depends on judicious selection of what intelligence is disseminated, the ability of all pertinent recipients to monitor the broadcast, and the ability of users to filter and select relevant intelligence for detailed examination. The broadcast mode improves dissemination timeliness, but must be used with discipline to avoid overloading MAGTF CIS pathways or intelligence processing capabilities.

Point-to-Point Mode

In the point-to-point mode, intelligence is disseminated to a specific user, normally in response

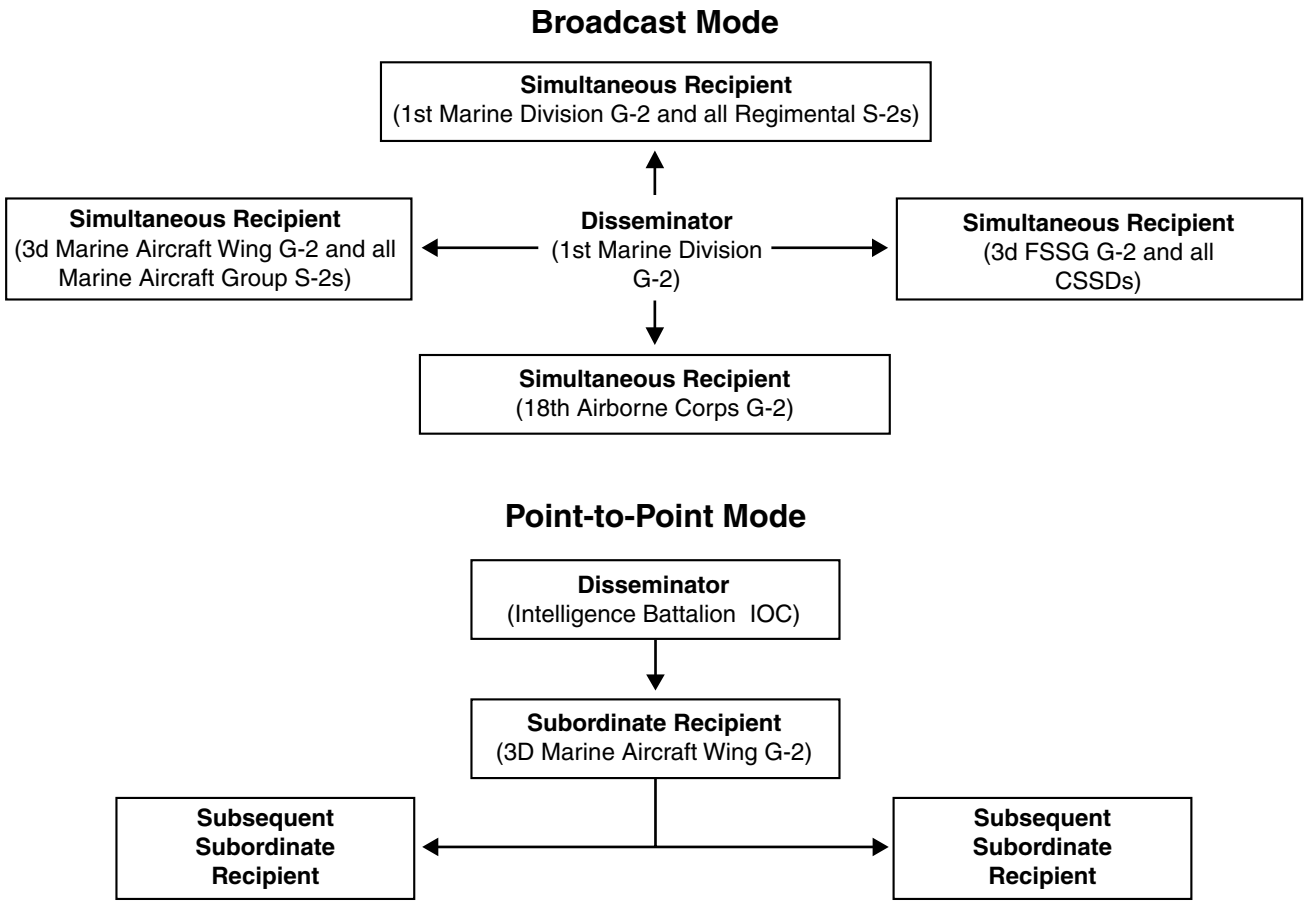

Figure 2-3. Intelligence Dissemination Modes.

to previously stated IRs. From there it may be further disseminated by users to others as appropriate. Although this mode is generally slower than the broadcast mode, it allows for intelligence to focus on specific user needs and allows the recipient to act as a control mechanism, filtering and integrating intelligence prior to disseminating it further. This control mechanism, however, adds risk as the intelligence meaning may become distorted as it is conveyed from one command to another. Examples of point-to-point modes include email, voice radio or telephone, and courier. When a secure WAN or local area network (LAN) is operational, a majority of intelligence disseminated between the MEF and its MSCs may be via email. Below the MSC level, the majority of point-to-point dissemination is by radio, wire communications or courier.

Dissemination Forms

The most suitable format for intelligence dissemination depends primarily on the needs of the recipient, the nature and urgency of the intelligence, and the means available to convey the information. The unit intelligence officer should specify a desired format (such as verbal, text, electronic) whenever stating an IPR and or/IDR.

Verbal

Verbal formats include dissemination via radio or telephone, face-to-face briefings, and discussions or via video-teleconferencing. The primary benefit of verbal formats is timeliness, in getting the information to the user, and by the disseminator having immediate, positive verification of delivery. Verbal forms can also enhance communication through subtle factors, such as tone of voice, inflection, facial expressions, body language, and gestures, which may convey greater meaning than the words alone. Verbal formats may be part of formal briefings that require complex graphics, detailed scripting, and rehearsals, which can monopolize personnel and material resources.

Text

Much intelligence is disseminated via documents, which may take many formats: plans, studies, analyses, estimates, assessments, reports, and electronic messages. Document dissemination provides a ready reference source, but may become obsolete, and may be difficult to rapidly and broadly disseminate during tactical operations.

Electronic

Many intelligence reports, databases, and sensor data are disseminated and updated electronically to improve timeliness and enable near real time connectivity between intelligence collectors, producers, and users. Examples include tactical LANs and WANs, and systems such as the JDISS and the IAS.

Reports

Intelligence reports and summaries are normally used to broadcast information electronically to a wide audience to update a current situation or subject of interest. Normally released according to a predetermined time schedule, reports continuously “refresh” databases but may lag in timeliness during a fast-moving crisis or battle.

Databases

Many intelligence-related databases are available for electronic dissemination. Threat and environmental databases are maintained within the intelligence battalion’s P&A cell. Subordinate units establish and maintain their own databases, tailored to their units’ intelligence needs.

Sensor Data and Information Streams

The G-2/S-2, G-3/S-3, and G-6/S-6 must coordinate sensor data and information management and dissemination-related issues, weigh the advantages and risks, and develop procedures. One example is the potential dissemination of

intelligence information (for example, video footage) directly from a collector (for example, an unmanned aerial vehicle) to a targeting or operational node perhaps via an intelligence operations node.

Graphical Products

Graphics, such as those used in map enhancements or contained in annotated imagery, portray vast amounts of intelligence in a condensed form more easily interpreted by the human mind. When appropriate, they should be incorporated in intelligence production and dissemination. The chief benefit of graphical dissemination formats, such as maps, overlays, annotated imagery, briefing graphics, and topographic products, is that they may be assimilated and understood by people more quickly than textually-based formats. Effective use of graphical product dissemination requires standards, procedures, and training. In most cases intelligence disseminated via graphics must be reinforced with supporting documents or supplemental information.

CHAPTER 3
INTELLIGENCE DISSEMINATION METHODOLOGY

Dissemination planning begins with an understanding of basic dissemination methodology. The three parts of IR are ICR, IPR, and IDR. Each IDR should be processed individually, using the methodology described in figure 3-1.

Determine Dissemination Requirements

Identify what intelligence is needed, who needs it, location, date required, and assign priority. Disseminators should—

- Optimize utilization.
- Stay in contact with commanders and other intelligence requestors.

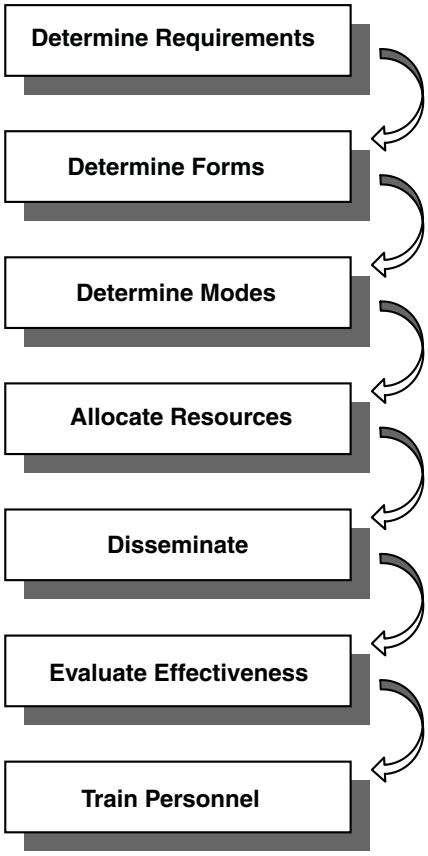

Figure 3-1. Dissemination Methodology.

- Determine common IRs.
- Develop planning tools.

Determine Dissemination Forms

Intelligence may be disseminated in a variety of formats and via verbal, text or graphical formats. The optimal form for dissemination best meets the needs of the user. It must answer the user's needs in the timeliest manner consistent with the urgency of the tactical situation.

A well-designed dissemination plan will take formatting factors into account and save man-hours otherwise spent on re-drafting and copying. Disseminators must be able to prepare and transmit the formatted intelligence in time to satisfy the user's LTIOVs. The format of the intelligence product must be compatible with the mode of transmission.

Dissemination planners must know the CIS capabilities and status of all supported elements. Since the CIS status of recipients may change at any time, disseminators must plan for alternate means of dissemination. Intended recipients in a highly mobile situation may be reliant on point-to-point phone or radio communications.

Determine Dissemination Modes

MAGTF intelligence staffs must identify dissemination channels and capabilities and plan for primary and alternate dissemination via common communication pathways. Available CIS bandwidth must be economized. Dissemination planners should—

- Identify and select both routine and time-sensitive modes.

- Determine and prioritize both dissemination point-to-point and broadcast modes for the widest possible range of tactical situations, to include standard and alarm situations and also criteria.
- Maintain awareness of the status of all MAGTF and key external CIS plans and operations.

Allocate Resources

The commander and intelligence officer exercising centralized control of intelligence dissemination must allocate resources to ensure that the needs of subordinate commanders are properly addressed and supported. Detachments from one or more intelligence/reconnaissance/CI unit may be placed in direct support (DS) or attached to subordinate units. They may also be used to create intelligence nodes to support a subordinate unit or center (for example, the rear area operations center; civil-military operations center). This must be done in coordination with the G-3/S-3 (for unit concept of operations and tactical task organization); the G-6/S-6 (for CIS resources); the G-1/S-1 (for personnel augmentation and courier support); the G-4/S-4 (for unique intelligence element's combat service support); and within the G-2/S-2 section for effective management of dissemination personnel and assets.

Disseminate

Intelligence products must be disseminated as quickly as possible to all relevant users. Dissemination planners should anticipate overloaded or disabled communication links by planning alternate distribution means. Redundancy must be planned for and used as needed.

Good reporting and dissemination flow diagrams and matrices assist in dissemination development, planning, and execution. They also provide combat operations center (COC), P&A cell, and SARC watch personnel with references to guide them in dissemination decisions.

Considerations During Dissemination

Current Tactical Situation

The dissemination plan will provide guidance for when, to whom, and how to disseminate the various types of intelligence and products.

Disseminators must always evaluate the IR against the current tactical situation; in addition to planned recipients ask who has a need for the intelligence; and initiate necessary action.

Status of Current Communications and Information Systems Readiness

Dissemination managers must continuously monitor the status of all CIS resources and pathways, primary and alternate. Continuous coordination with the G-2/S-2 COC watch officer and the G-6/S-6's systems control (SYSCON) and technical control (TECHCON) centers is mandatory to rapidly assess problems and determine availability of alternate communication means.

Quality Control of Dissemination

Dissemination planning is generally centrally managed. Dissemination execution is decentralized and conducted by a wide variety of individuals—P&A cell, SARC, and COC intelligence personnel; intelligence, CI, and reconnaissance collectors; and even operations, fires, and other nonintelligence personnel. New CIS technologies allow greater intelligence access to and dissemination from commands and organizations external to the MAGTF as well as command echelons within the MAGTF. Additionally, the ability of users to pull information from nonmilitary or intelligence sources (for example, news media, academia, nongovernmental organizations [NGOs]) and use it as intelligence presents a quality control challenge. Data may be incorrect, misleading, dated or incomplete, excessive or wrongly perceived as conclusive. Users may use this data without understanding the basis. Detailed, well-designed standing operating procedures (SOPs) and continuous coordination are critical to successfully dealing with these challenges.

Evaluate Effectiveness

After disseminating an intelligence product, disseminators must ensure that it was received and understood by all intended recipients. Intelligence products are occasionally misrouted or not transmitted completely. Verification of receipt can be accomplished through a telephone call or email confirmation from select addressees. Follow-on contact should be made to determine if intelligence needs were met or if the provided intelligence led to any new IRs.

Train Personnel

Regular and realistic training of all intelligence personnel and users is needed to improve their understanding of dissemination operational capabilities and limitations, their tactical abilities and judgments, and their technical skills and expertise.

Intelligence dissemination capabilities must be exercised under a variety of realistic tactical scenarios and operating conditions. Training must emphasizes unit SOPs, as well as other Service, joint, and intelligence agency procedures. Training must develop the following procedures:

- Ensure that dissemination problems experienced anywhere within the MAGTF are immediately brought to the attention of the appropriate personnel for corrective action.
- Maintain awareness of the current operational status of key intelligence-related and CIS resources.
- Confirm the receipt of disseminated intelligence.
- Quickly verify that CCIRS, PIRs, and IRs have been fully satisfied, and whether they generate or affect any new IRs.
- Enable commanders, planners, and other nonintelligence personnel to pull intelligence from databases, Web sites, publications, and other intelligence resources.
- Rehearse time-sensitive dissemination procedures, to include using alternate communication means.
- Disseminate intelligence to other Services, joint, multinational forces, and NGOs.
- Integrate intelligence and reconnaissance units' intelligence, C2, and CIS operations in HQs of all subordinate organizations down to the battalion, squadron, and combat service support detachment level.
- Execute specialized and unique intelligence dissemination CIS capabilities (for example, SCI sanitization and reporting of DOD clandestine collection activities).

CHAPTER 4
INTELLIGENCE DISSEMINATION PLANNING

The MAGTF intelligence section develops and implements intelligence dissemination plans. While written from the MEF intelligence section perspective, the guidelines addressed in this chapter may be tailored to any echelon. Appendix A provides a sample intelligence dissemination plan format. Appendix B provides a sample intelligence CIS plan format. Appendix C provides an IDR planning matrix format.

Planning Factors

Intelligence dissemination plans and procedures must incorporate the following:

- IDR priorities, to include integrated linkage with ICRs and IPRs.
- Grouping IRs by type of intelligence and echelon of intended recipient.
- Anticipated IDRs.
- Preferred intelligence product.
- Primary and alternate communication means with all supported units.
- Routine and time-sensitive dissemination means and responsibilities.
- Communications security (COMSEC) considerations.
- Procedures to verify that the intelligence has been received by the intended recipients.

MAGTF Dissemination Standing Operating Procedures, Plans, and Orders

The assistant chief of staff (AC/S) G-2 has overall responsibility for MAGTF intelligence dissemination SOPs, plans, and orders. The ISC is responsible for the preparation of the intelligence dissemination plan and the intelligence CIS plan. The CM/DO is responsible for execution.

The principal intelligence CIS planning guide/tool for a MAGTF operation is tab D, Intelligence CIS Plan, to Appendix 16 (Intelligence Operations Plan) of Annex B of the OPLAN/OPORD. Other portions of Annex B, however, also include key intelligence CIS information. For example, tabs A, B, and C to Appendix 16 (respectively, the collections, production and dissemination plans); tab E (Intelligence Reports) to Appendix 16; and paragraph 5 (Intelligence C2) to Annex B of the basic plan.

In addition to Annex B, portions of Annex K (CIS) influence intelligence CIS architecture planning. The following are included:

- Appendix 14, Communications Restoration.
- Appendix 23, Task Organization/Communications Guard Shifts.
- Appendix 26, Radio Battalion/special security officer (SSO) Communications.
- Appendix 31, Communications Support for Intelligence.
- Appendix 34, Internet Protocol Assignments.
- Appendix 35, CIS Support for Information Management.

Dissemination Planning Process

Intelligence dissemination should be—

- Preplanned.
- Tailored for specific recipients based on unit mission.
- Automated to the greatest degree possible.
- Included with back-up plans and manual means of dissemination.

Identify Dissemination Requirements

Validated and prioritized CCIRs, PIRs, and IRs drive IDR planning. When identifying requirements, the four W's—who, where, what, and when—provide a usable, four-step process for identifying dissemination needs.

Who

Identify and group who may need dissemination support, not only those specifically involved with an IR. These units may include higher HQ (for example, joint task force (JTF); external intelligence units (for example, JIC, joint interrogation and debriefing center or joint document exploitation center); adjacent units (for example, United States Army units); and internal elements of the MAGTF (current operations center, force fires coordination center, rear area operations center or civil-military operations center).

Where

Where intelligence is disseminated will likely correspond to the location of the intended recipient; however, command relationships, operational phase, task-organization or other factors may determine other locations for dissemination requirements. Intelligence dissemination planners must pay particular attention to special dissemination requirements during any of the following situations:

- Intelligence support provided via reach back or involving split-base operations.
- Location of unit C2 facilities during tactical displacements.
- When the unit can utilize communications provided by a collocated unit.
- Operations afloat and ship-shore movement phases.
- Heliborne or air movement operations.
- Terrain, weather or atmospheric conditions that may affect dissemination.

What

The next step is to determine what type intelligence support (for example, finished deliberate intelligence, time-sensitive intelligence products or particular formats) each recipient requires. The who and what are cross-referenced with the following:

- Finished intelligence products (intelligence studies, estimates or reports).
- Addressee indicator groups, Defense Special Security Communications System address groups, collective address designators, and MAGTF units.
- Alarm intelligence support (for example, I&W report or time-sensitive target of opportunity reporting).
- Imagery IRs.
- Signals intelligence (SIGINT) (for example, requirement for time-sensitive/non-codeword reporting; sanitized version SCI products).
- Human intelligence (HUMINT) (for example, CI time-sensitive reports, tactical interrogation reports, special CI reporting).
- Geographic intelligence (for example, planning and operational map allowance requirements, terrain models and analyses, geospatial information needed for automated systems).
- Reconnaissance and surveillance requirements.
- Level(s) of classified information that the user requires.
- Releasability and formats for sharing intelligence with multinational units.

When

The final basic dissemination planning step is to identify timeliness requirements. In general, intelligence should be disseminated as soon as possible. Planning considerations include the following:

- Rapidly assessing the feasibility of satisfying the commander's stated LTIOV requirement.
- Nature of the IR (for example, routine, time sensitive, CCIR).

- Communication transmission means desired by the user (for example, voice, text, electronic).
- Capabilities and current status of the MAGTF CIS system.

Develop the Intelligence and Information Flow

Intelligence Flow

Dissemination planning must begin with an analysis of intelligence and information processes. Visualization of the flow of intelligence flow can contribute to detailed planning. The use of various types of flow diagrams and dissemination planning matrices can assist in the process. When building a MAGTF dissemination matrix, key dissemination recipients, such as the MSCs, must always be depicted. No standard dissemination matrix has been developed for all dissemination planning functions; however, some examples are provided in Appendix C (Intelligence Dissemination Requirements Planning Matrix) and Appendix D (Intelligence Reports Dissemination Matrix Format).

Intelligence Reporting

An intelligence report matrix depicting standard and time-sensitive reporting guidance should be prepared for every operation. The particular format will be tailored to meet unit needs. The matrix should detail the flow of intelligence reports to be prepared or handled by the intelligence section and the IOC. For MAGTF elements, this should show the flow from the original reporter (collector, SARC or P&A cell) to recipients for each type intelligence report. Appendix D shows an example of an intelligence report matrix.

IDR Planning Matrix

The IDR planning matrix is a tool that assists the CM/DO in managing the MAGTF intelligence dissemination effort. Using an IDR planning matrix helps keep the focus on the commander's decision points, PIRs, and other key IRs. This format may be tailored as needed per unit SOP. See appendix C.

Develop the Dissemination Plan

The intelligence dissemination plan must be fully integrated with MEF collections and production operations; clearly state how the intelligence will

EXAMPLE

Notional MEF Intelligence Support to Targeting Flow

Targeting Related IR Management. Targeting-related IRs will be submitted by higher, adjacent, and subordinate elements. These will be submitted to the CM/DO in the intelligence operations center (IOC). The CM/DO will consult with the P&A cell and other producers to determine if they can answer the request. If yes, they will do so per either the production or dissemination plan, disseminate products as appropriate, and also post the answer or the product on the intelligence homepage. If the analysts cannot answer the request, they will so notify the CM/DO who will then prioritize and request collection.

Support to Time-Sensitive Targeting. Each potential source of time-sensitive targeting intelligence must make decisions on whether the combat information received constitutes high-payoff target reporting (HPTR), and if it is targetable. Daily guidance reflecting changes to the commander's intent, G-3 force fires targeting priorities, the daily targeting board, and the G-2/IOC's PIRs, and intelligence reporting criteria provides this. A tracking and identification code/system should be established for these reports. Reactive targeting occurs when high-payoff targets (HPTs) are located. This time-sensitive intelligence is collected and disseminated through the organization responsible for reporting from the sensor concerned. Generally, information will come to the MEF G-2 and its IOC through the SARC or the COC intelligence watch (point of contact for friendly unit intelligence and combat information reporting). In special cases and when authorized, this flow may be direct from a specialized intelligence unit to designated recipients (for example, from the radio battalion's operational control and analysis center to the COC).

Immediate Dissemination of High-Value Target Reporting. If the information is not an HPT or battle damage assessment (BDA) report, it is moved to the P&A cell for analysis. The P&A cell will review all reports to determine if they are high-value, time-sensitive intelligence. If yes, it will note who needs to see it and immediately disseminate it per the dissemination plan and intelligence reporting criteria. If no, it will determine who needs to see it, internal to the G-2, for use in subsequent intelligence P&AO.

Analysis and Dissemination of Intelligence Products. P&A cell analysts will process the information against the current and estimated future enemy situation using other relevant intelligence and databases as appropriate. Time-sensitive intelligence will rapidly be incorporated by the analyst into an intelligence report that is disseminated immediately per the dissemination plan and current reporting criteria. Where immediate dissemination is not required, the analyst will likely forward the intelligence for possible inclusion in the intelligence summary or other intelligence products. Where targets are developed through the analytical process, the analysts will forward all targets to P&A cell's target analysis/BDA team for follow-on support to the targeting process.

be delivered to the requestor; and be flexible enough to adapt to ongoing tactical developments. The dissemination plan must determine both the physical means of dissemination and procedures to be followed in transmission.

Design and Coordinate the Dissemination Architecture

An intelligence dissemination architecture should be designed schematically so that it depicts links from the source to the recipient. It should depict organizations, intelligence systems, and CIS connectivity among the forces' intelligence collectors/producers and the supported decision makers/planners and C2 nodes. It must encompass the different types of intelligence support, from higher HQ produced all-source intelligence through time-sensitive tactical intelligence information. To account for different types of data and intelligence, several linkages may need to be constructed. It must also depict both primary and alternate channels for standard and broadcast dissemination. The following must be incorporated:

- Detail the various means for dissemination: digital networks, radio, wire, and courier communications channels, to include MAGTF common as well as dedicated intelligence systems and architectures.
- Provide primary and alternate plans for standard, alarm, supply-push, and demand-pull capabilities.
- Account for different types of data forms and intelligence, to include that requiring special or unique security controls (for example, SCI).

The ISC has principal staff responsibility for the dissemination architecture. IDR architecture needs should be stated within the broader intelligence C2 and CIS requirements, approved by the G-2 and the commander, and then provided in a prioritized list to appropriate G-3/S-3, G-5/S-5, and G-6/S-6 planners. Tailored copies may also be provided to higher and subordinate intelligence officers to support collaborative detailed planning.

Establish Dissemination Procedures

Dissemination procedures should be established for the delivery of intelligence from producers. The precedence of transmission (for example, routine and flash) should be agreed upon by all involved parties in advance. Audiences should be predetermined by defining broadcast parameters. Reporting thresholds and filters should be identified early.

Plan and Manage the Common Tactical Picture, Common Operational Picture

The dissemination of common tactical picture (CTP) track data, its subsequent processing, and further dissemination must be planned for, monitored, and managed. Track management procedures must be established to achieve a useful CTP within the higher level common operational picture (COP) environment. Each echelon of command, beginning at the tactical maneuver battalion/aviation squadron level, reports and manages the track database for its own units and those attached or in DS. Track data should be auto-forwarded via broadcast up to the next higher echelon until it reaches the MAGTF CE. Once correlated, track data is rebroadcast back down to each subsequent echelon as the MAGTF CTP. As track data is updated it automatically updates each echelon database and CTP. This dissemination process must be carefully managed.

Communications Security

The effective dissemination of intelligence requires secure communication means. COMSEC planning considerations include the following:

- Coordinate with the appointed SSOs in all units authorized to receive and use SCI.
- Adhere to SCI security handling, processing, and storage requirements.

- Obtain authority and establish procedures for the sanitization of SCI products, reports, and other information.
- Determine and coordinate SCI and GENSER LANs and WANs.
- Determine and coordinate both SCI and GENSER courier requirements and operations.
- Determine COMSEC materiel system requirements for intelligence and SCI communications.
- Determine communication requirements between sensitive compartmented information facilities (SCIFs), tactical sensitive compartmented information facilities (TSCIFs), supporting security forces, and supported units.

Allocate Resources

The intelligence officer, in coordination with the unit's communications officer, should allocate available personnel and equipment resources to support the dissemination requested. Requirements must be estimated and resources allocated for routine and time-sensitive operations, with sufficient redundant capabilities for each.

Monitor Execution

A wide range of intelligence dissemination will be occurring simultaneously. It is critical to constantly evaluate its effectiveness, the quality of support provided to commanders, and rapidly identify and resolve problems as follows:

- Develop a dissemination tracking matrix to record receipt of major and/or critical intelligence and products by intended recipients. (See fig. 4-1)
- Determine if the user is satisfied with the quality and quantity of intelligence.
- Supervise adherence to specified dissemination priorities and reporting criteria.
- Ensure that no precedence abuse exists or information overload occurs to degrade or overload communication channels.

Maintain awareness of the operational status of all supporting CIS, as well as the status of PIRs, IRs, and IDRs, to rapidly make necessary changes consistent with ongoing operations.

CHAPTER 5
INTELLIGENCE ESTIMATES AND STUDIES

Intelligence estimates, studies, reports, and briefings are the principal intelligence products disseminated during MAGTF operations. Detailed information on preparing each is contained in MCWP 2-12, *MAGTF Intelligence Production and Analysis*.

Dissemination

Disseminating intelligence estimates and studies provides large amounts of detailed data in support of general operational planning. Many estimates and studies are scheduled production documents; however, estimates and studies may be produced and distributed quickly during a rapidly developing crisis. Intelligence estimates and studies may be disseminated via paper copy or a computer diskette mailed to a predetermined distribution list or electronically via a secure datalink. In most cases, broader dissemination will be possible by posting these products on Web pages accessible by the intended recipient.

Advantages versus Disadvantages

Intelligence estimates and studies are often accompanied by overlays, color graphics, and other aids in a standardized format. Once disseminated, these documents are available for continuous reference. But while intelligence estimates and studies can serve as invaluable background references, they require significant time and resources to produce. These products are prepared with a specific information cut-off time and may be difficult to update quickly. In a crisis, intelligence estimates and studies may be difficult to reproduce mechanically for rapid dissemination to all necessary subordinate units. Reproduction or reformatting of imagery and geospatial information materials can be particularly difficult.

Intelligence Estimate

The intelligence estimate is the primary means for providing basic and current intelligence and results of the intelligence preparation of the battlespace (IPB) effort focused on a specific mission. It is usually the first significant intelligence product developed to support initial orientation, immediate mission analysis, and other planning needs. The scope and detail of the estimate will be determined by the following:

- Resources of the command preparing it.
- Nature of the operation.
- Available intelligence.
- Identified IRs.
- Prior contingency planning.
- Time and resources available.

The intelligence estimate should be succinct, yet provide commanders and staffs the necessary intelligence for planning and early decisionmaking. A summary of basic intelligence, the estimate normally uses supporting studies for in-depth treatment of specific aspects of the enemy situation or the area of operations (AO). Whenever possible, the intelligence estimate should clearly present the analysis and conclusions developed during IPB. When contained in an OPLAN or OPORD, the intelligence estimate is typically found in Appendix 11 to Annex B. The finished estimate may be written, graphic or verbal in form. Subparagraphs and tabs may be added and omitted, based on their relevance to the stated mission. For topics that require a large

amount of data, information and intelligence (for example, beaches, weapons capabilities, and technical characteristics), the salient facts, and conclusions should be summarized in the body of the estimate with details included as a tab(s).

MAGTF Contingency Intelligence Study

This is a baseline intelligence study prepared in advance for standing OPLANs and likely contingencies. It is based on the intelligence estimate format and can be updated relatively quickly and converted into an intelligence estimate when an alert or warning order is received.

Intelligence Studies

Intelligence studies deliver detailed intelligence on specific aspects of the AO or threat (for example, beaches, minefields, helicopter landing zones (HLZ)s, hydrography or airfields). Studies directly support intelligence estimates. Wherever possible, standardized formats should be used and essential intelligence should be transformed into graphics. Unit intelligence studies should be disseminated at least two echelons upward and downward, especially if the intelligence contained in the study is derived from organic collection assets.

Target/Objective Studies

Target/objective studies are focused, detailed intelligence products that aid in the application of fires or the maneuver of forces against a specific target set or area. These studies can also be used by small units for mission preparation and execution. Target/objective studies are graphically oriented and may use many of the graphics derived during the IPB process. This intelligence product provides tailored, detailed, mission-specific intelligence in support of small unit execution. It usually consists of text descriptions that are supported by graphics. Graphics may include annotated imagery, map enhancements, terrain models, blueprints, diagrams, and schematics. Target folders contain textual descriptions and graphics, but annotated imagery, map enhancements, diagrams, schematics, and mapping products are key elements. In a tactical situation, target intelligence becomes highly perishable and must be disseminated as quickly as possible to controlling, coordinating, and delivering units.

Intelligence Preparation of the Battlespace Products

IPB is a continuous, systemic process of analyzing the threat and environment presented in the intelligence estimate. IPB products provide supported commanders and planners with a graphic portrayal of the battlespace. By integrating, analyzing, evaluating, interpreting, and fusing vast amounts of textual information into symbols, IPB products convey easily understood overlays to operators and planners with detailed intelligence available in supporting text products or intelligence databases. Overlays, such as the modified combined obstacle and fields of fire overlays, quickly and effectively depict such key terrain and enemy characteristics as mobility corridors, obstacles, terrain trafficability, and threat COAs. IPB overlay updates should always be disseminated as rapidly as possible to other staff sections and subordinate units.

Standardized formats for IPB products should be used to the maximum extent possible and tailored according to the situation or a user's unique needs.

CHAPTER 6
INTELLIGENCE BRIEFINGS

The ability to prepare and convey intelligence in a clear, concise manner is an essential skill for intelligence personnel. For the operational intelligence officer, the briefings will be the most common way to disseminate intelligence to the command. However, intelligence personnel at all command levels frequently use intelligence briefings, formal and informal, to disseminate intelligence to commanders, staffs, and others.

Intelligence briefings are used to convey information in a concise, mission-oriented format. Depending on available preparation time, briefing styles can range from formal presentations with detailed hand-outs and graphics to concise verbal updates.

Dissemination

In nontactical situations, given sufficient lead-time, formal briefings can be supplemented with multimedia products. During operations, intelligence can be relayed rapidly through short verbal updates. To convey a large amount of intelligence, paper hand-outs, electronic presentations, graphics or other supplemental material covering key briefing points may accompany the verbal presentation.

The intelligence brief should focus on the intelligence and events that correspond to the CCIRs and other PIRs. Doing so ensures that the commander is given the most essential information in the shortest amount of time. This does not preclude additional information being presented. If something of significance occurs that affects the current or future plans, the commander must be informed. Good judgment must prevail.

Advantages versus Disadvantages

Briefings are an effective way to disseminate intelligence quickly. They permit interaction with the user and allow the user to provide instant feedback to the briefer on content and conclusions or to ask questions. Preparation for briefings can be time-consuming, however; and briefings usually reach only a selected audience, such as the commander's staff.

Information Brief

The most common form of briefing is the information brief. Its primary purposes are initial situation orientation for planning and enhancing situational awareness and understanding. Common examples are the initial staff orientation brief, the commander's daily update, intelligence update, intelligence estimate of supportability, mission/target intelligence brief, and the technical intelligence brief.

Initial Staff Orientation Brief

The initial staff intelligence orientation brief disseminates important characteristics of the AO and the threat. Its goal is to indoctrinate key personnel to the overall intelligence perspective concerning an impending operation and to rapidly focus commanders and key planners on mission critical factors. The initial intelligence orientation brief should generally follow the intelligence estimate format, supplying all relevant intelligence on the AO and the enemy. Much of the content of this type briefing is derived from

higher-echelon studies and estimates and is presented as basic background intelligence. Because this type briefing can easily become too long or too detailed for timely dissemination, graphics should be used wherever possible.

Commander's Daily Update Brief

Morning or evening update briefs may be formal and detailed. They are scheduled for set times once or twice per day. Intelligence may be only part of the overall briefing. The intelligence topics include the following:

- The current situation and significant events.
- CCIRs, PIRs, and IRs.
- Collection, production, and dissemination plans and their status.
- Weather.
- Estimates of future threat actions.
- At a minimum, most likely and most dangerous enemy COAs.

Intelligence Update Brief

The intelligence update brief reviews intelligence activity since the last briefing, presents the current intelligence situation, and estimates anticipated enemy activities that may affect friendly COAs. Intelligence updates are usually scheduled briefings and are designed to address predetermined periods of time such as every 12 or 24 hours. Examples include watch turnover briefs in the unit COC, IOC or SARC. The intelligence update brief follows a temporal outline, commencing with the reporting of any significant enemy activity, including any enemy losses since the last update. It presents the current enemy situation, followed by weather forecasts, as well as intelligence estimates of enemy COAs and activity during the next reporting period. The update should also address friendly intelligence collection, production, and dissemination operations.

Intelligence Estimate of Supportability

An intelligence estimate of supportability briefing evaluates friendly COAs based on the capabilities and limitations of organic and supporting intelligence, counterintelligence, and reconnaissance forces. Its goal is to assist the commander in understanding intelligence operations capabilities, with all other friendly functional capabilities, to decide the most promising friendly COA and to identify IRs. The intelligence estimate of supportability brief addresses key factors identified by intelligence personnel that may influence friendly intelligence operations that include the following:

- Terrain.
- Weather.
- Current political situation.
- Possible reactions from the civilian populace.
- Enemy's relative strengths and weaknesses.
- Susceptibility to friendly deception or psychological operations.

The briefing addresses enemy COAs, analyzes enemy COAs versus friendly COAs based on the key factors, identifies the preferred friendly COA, and offers any other recommendations to the commander.

Mission/Target Intelligence Brief

The mission/target intelligence brief provides detailed and tailored intelligence to support execution of a specific mission. The mission/target intelligence brief has no prescribed format but should contain all pertinent intelligence impacting on a specific mission or target. Normally, this type briefing provides any intelligence and other information on activity occurring or expected to occur within a predetermined radius from a target or mission area and within a predetermined amount of time from mission execution. At a

minimum, it should include an area orientation and detailed descriptions of entry points, the objective area, and the expected threat, including enemy locations, dispositions, capabilities, and vulnerabilities. Graphics should be employed extensively to portray potential enemy strengths, vulnerabilities, and potential COAs.

Technical Intelligence Brief

The technical intelligence brief provides detailed intelligence on a specific enemy weapon system, piece of equipment or functional capability and limitations. This type of briefing disseminates a substantial amount of technical and scientific intelligence in a condensed format. The technical intelligence brief has no prescribed form but should, at a minimum, provide a detailed description of the threat or weapon system and its attendant characteristics, capabilities, and vulnerabilities. If the system has associated unique visual or electronic signatures, ensure all known operating parameters are disseminated to intelligence, targeting, and key maneuver personnel. The briefing should also describe how the enemy employs the system (for example, tactics, processes, and procedures) and where it is currently deployed (for example, order of battle). Graphics should be used wherever possible to quickly convey this type of complex information.

CHAPTER 7
INTELLIGENCE REPORTS

Intelligence reports disseminate intelligence quickly to a wide audience for immediate use. Because reports contain sensitive information, they are usually transmitted by a secure communication means. Intelligence reports should be disseminated in accordance with either collection or reporting criteria or the dissemination plan. MCWP 2-12 and other MCWP and MCRP intelligence series publications provide the basic formats for these reports.

Summary Intelligence Reports

Summary intelligence reports provide the commander with an overview of significant enemy activity within a specified period of time and project anticipated enemy actions during the next reporting period. Summary reports are usually scheduled products disseminated at specific times as dictated by unit SOPs or OPLANS/OPORDs. Standard summary reports, disseminated at scheduled times, are well-suited for demand-pull dissemination, such as being posted on the MAGTF secure TDN.

Intelligence Summary

The intelligence summary (INTSUM) is a text-based or text and graphic intelligence report that provides a summary of the intelligence situation covering a specific period, normally prescribed by the unit SOP for intelligence or the intelligence annex to the OPORD (for a MEF-level operation, typically every 12 or 24 hours). It is used to report threat activities, changes to threat capabilities, and the results of further P&A. It is designed to update the original and subsequent intelligence estimates. INTSUM distribution will be in accordance with the dissemination plan, but generally will be disseminated at least to immediate higher and subordinate commands. Using the basic format, units can tailor the INTSUM to fit the situation. With new automated information systems, INTSUMs are increasingly produced in graphic form and posted on networks for wide dissemination, with links to detailed supporting intelligence products, reports, and databases. The graphic INTSUM is maintained on computer screens linked to intelligence databases or on conventional maps with displayed/accessible supporting information.

Daily Intelligence Summary

A daily intelligence summary (DISUM) is a report prepared in message form at the JTF HQ that provides higher, lateral, and subordinate headquarters with a summary of all significant intelligence produced during the previous 24-hour period. The "as of" time for the information, content, and submission time for the report will be as specified by the joint force commander. (JP 1-02)

At higher command levels, particularly JTFs and unified commands, a DISUM will usually be published every 24 hours. While INTSUMs, particularly at lower tactical echelons, provide a tactical perspective, the DISUM is broader in scope, potentially encompasses more aspects of the threat country's elements of national power, and focuses on operational-level intelligence analysis and estimates. MAGTF command elements tasked as JTF HQ will generally be required to submit DISUMs to the combatant command HQ. See the combatant command's tactics, techniques, and procedures for the DISUM format. Although generally the same, formats may vary from theater to theater.

Periodic Intelligence Summary

The periodic intelligence summary (PERINTSUM) is a report of the intelligence situation in a tactical operation (normally produced at corps level or its equivalent and higher) usually at intervals of 24 hours or as directed by the commander. (JP 1-02)

The PERINTSUM is an expanded INTSUM covering a greater period of time as dictated by the commander. It is a means for disseminating more detailed intelligence than that provided in INTSUMs or DISUMs. PERINTSUMs are normally issued by the MAGTF CE for dissemination to higher, lower, and adjacent commands. Subordinate units may also be tasked to prepare them if directed by the commander. The format for PERINTSUMs generally is the same as used for DISUMs.

Specialized Intelligence Reports

Specialized reports include event-driven intelligence reports, such as size, activity, location, unit, time, and equipment (SALUTE) reports, and various intelligence discipline-unique intelligence reports, such as tactical electronic intelligence reports, initial photographic intelligence reports, CI spot reports, surf observation reports, and bridge reports. The purpose of generating event-driven intelligence reports is to disseminate significant intelligence to the commander or to intelligence operations personnel that could immediately alter the tactical situation or to support situation development. Event-driven and other specialized intelligence reports are disseminated as required.

Intelligence Report

The intelligence report is a standardized report that is prepared and disseminated based on its importance to the current situation rather than on a specific time schedule. It is the primary means for transmitting new and significant intelligence when facts influencing threat capabilities have been observed or when a change in threat capabilities has taken place. It is prepared at all echelons by the first intelligence element acquiring the information and forming the intelligence estimate, and is disseminated as rapidly as possible to all units that need the reported information. It may be prepared on any item of intelligence, regardless of source. Each report will concern only a single item of interest.

Battle Damage Assessment Reporting

The intelligence officer (at the MEF CE level, the ISC) ensures BDA reports conform to the OPLAN, report the nature of damage inflicted or unit/systems destroyed, and assess the degree of mission success as it relates to the initial objective. When possible, BDA reporting includes the physical damage assessment (PDA) and an analysis of the consequence of the damage on the threat unit.

At each echelon, the intelligence officer compiles, refines, and validates the various sources of BDA and develops consolidated PDAs and/or combat strength assessments. Commands will forward consolidated BDA reporting of their subordinates. MSCs will typically forward a summary BDA report to the MEF, usually covering set time periods.

At the MEF level, the P&A company, intelligence battalion, is responsible for adjusting the master order of battle databases to reflect threat combat losses. The BDA cell will prepare and disseminate formal Phase I BDA reports in accordance with theater and national policies and procedures. See MCWP 2-12 for information on BDA analysis and reporting.

Mission Report

Mission reports (MISREPs) are used by aviation units to report significant results of aircraft missions and nonimagery sightings along flight routes. They employ a standardized format that includes air task/mission number or nickname, location identifiers, time on target/time of sighting, results/sighting information, and remarks. Upon completion of post-flight debriefing, squadron S-2s should disseminate MISREPs to the MAGTF G-2/S-2 by the most expeditious means possible.

Response to a Request for Intelligence

Responses to a request for intelligence (RRFIs) are nonscheduled products designed to fill gaps in knowledge identified by subordinate tactical units. RRFIs should be answered and disseminated as quickly as possible.

Intelligence Reports Plan and Matrix

Detailed guidance and instructions for dissemination of intelligence reports must be established to ensure effective, efficient, and accurate intelligence dissemination. This may be accomplished through the use of an intelligence report matrix. The CM/DO develops and updates dissemination procedures, architectures, and reporting matrixes. The intelligence report matrix is an exhibit to the intelligence reports tab to Annex B of intelligence OPLAN/OPORD. Report matrixes may be adjusted by unit SOP. See appendix D for a sample format.

APPENDIX A
MAGTF INTELLIGENCE DISSEMINATION PLAN
APPENDIX FORMAT

Tab C (Intelligence Dissemination Plan) to Appendix 16 (Intelligence Operations Plan) to Annex B (Intelligence) explains how intelligence dissemination elements supporting the MAGTF will be used to support the operation.

CLASSIFICATION

TAB C TO APPENDIX 16 (INTELLIGENCE OPERATIONS PLAN) TO ANNEX B (INTELLIGENCE) TO MAGTF OPORD X (U)
INTELLIGENCE DISSEMINATION PLAN (U)

(U) REFERENCES: Identify organic DOD; Director, National Security Agency; National Imagery and Mapping Agency, and other directives; combatant commander, JTF, joint force maritime component commander/joint force land component commander/joint force air component commander or other higher authorities'OPORDs, tactics, techniques, and procedures), and SOPs for intelligence dissemination operations; intelligence reporting formats or any other relevant documents that pertain to anticipated intelligence dissemination operations.

1. (U) Situation

   a. (U) Define the AO and Area of Interest. Describe the limits of the AO and area of interest. Summarize pertinent weather, terrain, and other AO characteristics and conditions as they may influence the conduct of intelligence dissemination operations.

   b. (U) Enemy. Refer to Annex B (Intelligence) and current intelligence estimates for threat capabilities, limitations, vulnerabilities, and order of battle pertinent to intelligence dissemination operations.

CLASSIFICATION

c. (U) Assigned MAGTF Organic and Supporting Intelligence Dissemination Assets. Identify organic and supporting forces available to perform intelligence dissemination functions.

d. (U) Assumptions. (Derived during the mission analysis step of the Marine Corps Planning Process.)

e. (U) Intelligence Dissemination Considerations. List key intelligence dissemination, CIS and interoperability considerations that impact this OPLAN/OPORD.

(1) (U) Availability of national and commercial intelligence and multipurpose CIS resources.

(2) (U) Intelligence C2 and dissemination support to and from JTF or component HQ and other external commands and/or intelligence organizations.

(3) (U) Creation and manning of forward intelligence C2 and operations elements.

2. (U) Mission. State concisely the intelligence dissemination mission as it relates to the command's planned operations.

3. (U) Execution

a. (U) Concept of Operations. Summarize command relationships, task-organization, main and supporting efforts, and the scope of MAGTF and supporting intelligence dissemination operations. Reference the unit's intelligence SOP and Appendix 16 (Intelligence Operations Plan) to Annex B. Restate as appropriate the commander's intent and pertinent aspects of the unit's overall concept of operations as they relate to intelligence operations. Outline the purpose and concept of intelligence dissemination operations, specified priorities, and summarize the means and agencies to be employed to support the operations and intelligence concepts of operations. Address the integration of JTF, other components, theater, national, and allied intelligence operations, dissemination, and CIS support.

b. (U) Dissemination Tasks for Intelligence Units and Organizations, Subordinate Units, and Detachment Commanders/Officers in Charge.

(1) (U) Orders to Subordinate, Attached, and Supporting Units. Use separate subparagraphs to list detailed instructions for each unit conducting intelligence-related dissemination operations, including the originating HQ, subordinate commands, and separate intelligence support units.

CLASSIFICATION

(a) (U) Marine division(s).

(b) (U) Marine aircraft wing(s).

(c) (U) Force service support group(s).

(d) (U) Commanding officer, intelligence battalion/intelligence support coordinator.

1 (U) Officer in charge (OIC), support cell.

2 (U) OIC, P&A cell.

3 (U) OIC, surveillance and reconnaissance cell.

4 (U) Intelligence systems officer.

5 (U) Commanding officer, CI/HUMINT company.

6 (U) Platoon commander, imagery intelligence platoon.

7 (U) Platoon commander, topographic platoon.

8 (U) OIC, joint surveillance target attack radar system common ground station.

(e) (U) Commanding officer, Marine unmanned aerial vehicle squadron.

(f) (U) Commanding officer, Marine tactical electronic warfare squadron.

(g) (U) Commanding officer, radio battalion.

(h) (U) Commanding officer, force reconnaissance company.

(i) (U) OIC, national intelligence support team (if attached).

(2) (U) Requests to Higher, Adjacent, and Cooperating Units. Provide separate numbered subparagraphs pertaining to each unit not organic, attached or supporting and from which intelligence dissemination support is requested, including other components, JTF HQ, allied or coalition forces, theater, and national operational and intelligence elements.

CLASSIFICATION

c. (U) Coordinating Instructions. Reference Appendix 16 (Intelligence Operations Plan), Annex K (CIS), Annex J (C2), as well as command, other unit, intelligence and CI SOPs. Detail here or in supporting tabs key changes to unit SOPs. Additional topics to include are as follows:

- Requesting dissemination support.
- Timely reporting procedures for intelligence CIS problems.
- Coordinating switchover to backup dissemination paths.
- Intelligence operations.
- C2.
- CIS hand over between command echelons.

(1) (U) General Dissemination Guidance and Procedures. Use separate subparagraphs to list detailed instructions for routine and time-sensitive dissemination, precedence of transmissions, predetermined recipient lists, general and specific broadcast parameters, reporting thresholds and reporting filters.

(2) (U) Intelligence Reporting Criteria

(3) (U) Resource Allocation. Discuss dissemination resource allocation between the main and supporting efforts, and between support to current operations and support to future operations.

(4) (U) Intranet Management. List detailed instructions for homepage and database management, to include authorities for posting, updating, and removing information and intelligence.

(5) (U) Common Operational Picture/Common Tactical Picture. List detailed instructions for track data and auto-forwarding, broadcast times, and boundary/ track ownership responsibilities.

(6) (U) Formats and Standardization. Provide formats for internal and external MAGTF intelligence dissemination and reporting, preformatted templates and/or where to find these referenced elsewhere in the OPORD. Include standards and limits on size and composition of files attached to electronic mail.

CLASSIFICATION

4. (U) Administration and Logistics

a. (U) Logistics. Reference Annex D (Logistics). Identify intelligence dissemination logistics requirements and concerns, such as follows:

- Unique combat service support requirements (batteries, unique replacement parts).
- Procedures, and other guidance to support MAGTF intelligence units and operations.
- Procedures for specialized technical logistics support necessary from external organizations.
- Map distribution.
- Requirements for courier runs.

b. (U) Personnel. Identify personnel requirements and concerns that affect intelligence dissemination operations and support (systems administrators or global sourcing requirements).

5. (U) Command and Control

a. (U) Command Relationships. Reference Annex J (Command Relationships). Provide any instructions necessary regarding MAGTF command relationships that will influence intelligence operations and dissemination support.

b. (U) Information Management. Reference Annex U (Information Management), Annex C (Operations) and Appendix 16 (Intelligence Operations Plan). Provide any instructions necessary regarding information management (time-sensitive and routine reporting criteria, intelligence databases, reports) that will influence MAGTF intelligence dissemination, reporting, and other operations.

c. (U) Communications and Information Systems. Reference Appendix 16 (Intelligence Operations Plan) and Annex K (CIS). Provide any instructions necessary regarding CIS that will influence MAGTF intelligence dissemination operations. List intelligence dissemination priorities (by operational phase, intelligence units, operational intelligence and C2 nodes, and intelligence activities. Choose the most effective approach for the operation.

CLASSIFICATION

d. (U) Intelligence C2 Nodes and Facilities. Reference the unit's SOP and Appendix 16 (Intelligence Operations Plan). Provide any guidance and instructions necessary regarding establishment and operation of intelligence C2 nodes and facilities and dissemination support and priorities to these to include as follows:

- G-2/S-2 elements within future plans.
- Future operations.
- Current operations, and force fires centers.
- IOC's support cell.
- SARC and P&A cell.
- CI/HUMINT company command post.
- Reconnaissance operations center.
- Operations control and analysis center.
- Command element tactical or rear echelons.
- Intelligence liaison elements.

Tab D TO APPENDIX 16 (INTELLIGENCE OPERATIONS PLAN) TO ANNEX B (INTELLIGENCE) TO MAGTF OPORD X (U)
INTELLIGENCE COMMUNICATIONS AND INFORMATION SYSTEMS PLAN (U)

REFERENCES: Identify organic DOD; Director, National Security Agency; National Imagery and Mapping Agency; and other directives; combatant commander, JTF, joint force maritime component commander/joint force land component commander/joint force air component commander or other higher authorities' OPORDS, TTP, and SOP for intelligence CIS operations; formats; and any other relevant documents that pertain to anticipated intelligence operations.

1. (U) Situation

a. (U) Define the AO and Area of Interest. Describe the limits of the AO and area of interest. Summarize pertinent weather, terrain, and other AO characteristics and conditions as they may influence the conduct of intelligence CIS operations.

b. (U) Enemy. Refer to Annex B (Intelligence) and current intelligence estimates for threat capabilities, limitations, vulnerabilities, and order of battle pertinent to intelligence CIS operations.

CLASSIFICATION

c. (U) Assigned MAGTF Organic and Supporting Intelligence CIS Assets. Identify organic and supporting forces available to perform C2 or intelligence CIS functions.

d. (U) Assumptions. Derived during the mission analysis step of the Marine Corps planning process.

e. (U) Intelligence CIS Considerations. List key intelligence CIS and interoperability considerations that impact this OPLAN/OPORD.

(1) (U) Availability of national and commercial intelligence and multipurpose CIS resources.

(2) (U) Intelligence C2 and dissemination support to and from JTF/component HQ and other external commands and intelligence organizations.

(3) (U) Creation and manning of forward intelligence C2 and operations elements.

2. (U) MISSION. State concisely the intelligence CIS mission as it relates to the command's planned operations.

3. (U) Execution

a. (U) Concept of Operations. Summarize command relationships, task organization, main and supporting efforts, and the scope of MAGTF and supporting intelligence CIS operations. Reference the unit's intelligence SOP and Appendix 16 (Intelligence Operations Plan) to Annex B. Restate as appropriate the commander's intent and pertinent aspects of the unit's overall concept of operations as they relate to intelligence operations. Outline the purpose and concept of intelligence CIS operations, specified priorities, and summarize the means and agencies to be employed to support the operations and intelligence concepts of operations. Address the integration of JTF, other components, theater, national, and allied intelligence operations and CIS support.

b. (U) CIS Tasks for Intelligence Units and Organizations, Subordinate Units, and Detachment Commanders/Officers in Charge.

(1) (U) Orders to Subordinate, Attached, and Supporting Units. Use separate sub-paragraphs to list detailed instructions for each unit conducting intelligence-related dissemination operations, including the originating HQ, subordinate commands, and separate intelligence support units.

CLASSIFICATION

(a) (U) Marine division(s).

(b) (U) Marine aircraft wing(s).

(c) (U) Force service support group(s).

(d) (U) Commanding officer, intelligence battalion/intelligence support coordinator.

1 (U) OIC, support cell.

2 (U) OIC, P&A cell.

3 (U) OIC, SARC.

4 (U) Intelligence systems officer.

5 (U) Commanding officer, CI/HUMINT company.

6 (U) Platoon commander, imagery intelligence platoon.

7 (U) Platoon commander, topographic platoon.

8 (U) OIC, joint surveillance target attack radar system common ground station.

(e) (U) Commanding officer, Marine unmanned aerial vehicle squadron.

(f) (U) Commanding officer, Marine tactical electronic warfare squadron.

(g) (U) Commanding officer, radio battalion.

(h) (U) Commanding officer, force reconnaissance company.

(i) (U) OIC, national intelligence support team (if attached).

(2) (U) Requests to Higher, Adjacent, and Cooperating Units. Provide separate numbered subparagraphs pertaining to each unit not organic, attached or supporting and from which intelligence CIS support is requested, including other components, JTF HQ, allied or coalition forces, theater, and national operational and intelligence elements.

CLASSIFICATION

c. (U) Coordinating Instructions. Reference Appendix 16 (Intelligence Operations Plan), Annex K (CIS), Annex J (C2), and command, other unit, intelligence and CI SOPs. Detail here or in supporting tabs key changes to unit SOPs. Additional topics to include are as follows:

- Requesting CIS support.
- Timely reporting procedures for intelligence CIS problems.
- Coordinating switchover to backup dissemination paths.
- Intelligence operations.
- C2.
- CIS hand over between command echelons.

4. (U) Administration and Logistics

a. (U) Logistics. Reference Annex D (Logistics). Identify intelligence CIS logistics requirements and concerns, such as follows:

- Unique combat service support requirements (batteries, unique replacement art).
- Procedures, and other guidance to support MAGTF intelligence units and operations.
- Procedures for specialized technical logistics support necessary from external organizations.
- Requirements for courier runs.

b. (U) Personnel. Identify personnel requirements and concerns that affect intelligence CIS operations and support (systems administrators, global sourcing requirements).

5. (U) Command and Control

a. (U) Command Relationships. Reference Annex J (Command Relationships). Provide any instructions necessary regarding MAGTF command relationships that will influence intelligence operations and CIS support.

b. (U) Information Management. Reference Annex U (Information Management), Annex C (Operations) and Appendix 16 (Intelligence Operations Plan). Provide any instructions necessary regarding information management (time-sensitive and routine reporting criteria, intelligence databases, reports) that will influence MAGTF intelligence CIS, reporting, and other operations.

CLASSIFICATION

c. (U) Communications and Information Systems. Reference Appendix 16 (Intelligence Operations Plan) and Annex K (CIS). Provide any instructions necessary regarding CIS that will influence MAGTF intelligence dissemination operations. List intelligence CIS priorities by operational phase, intelligence units, intelligence operations and C2 nodes, and intelligence activities. Use the most effective approach for the operation.

d. (U) Intelligence C2 Nodes and Facilities. Reference the unit's SOP and Appendix 16 (Intelligence Operations Plan). Provide any guidance and instructions necessary regarding establishment and operation of intelligence C2 nodes and facilities and CIS support and priorities to these to include as follows:

- G-2/S-2 elements within future plans.
- Future operations.
- Current operations, and force fires centers.
- IOC's support cell.
- SARC and P&A cell.
- CI/HUMINT company command post.
- Reconnaissance operations center.
- Operations control and analysis center.
- Command element tactical or rear echelons.
- Intelligence liaison elements.

TABS:

A Intelligence CIS Architecture Diagrams

- Include an diagram for the overall, overarching intelligence CIS architecture.
- Include diagrams by intelligence discipline (imagery intelligence, signals intelligence, HUMINT) if possible and useful for the operation.
- Include blueprints and CIS wire diagrams for all intelligence C2 and operations nodes and facilities, as appropriate.

B Intelligence Information Management Flow Diagram(s)

APPENDIX C
SAMPLE INTELLIGENCE DISSEMINATION REQUIREMENTS PLANNING MATRIX

The sample IDR planning matrix is developed to assist in dissemination planning and includes the following information.

Requestor: identify the unit name or staff section that requested the intelligence or products. If the requestor has assigned the IR a control number, also list the control number here.

CCIR/PIR/IR: identify the supported CCIR, PIR or IR. This may be either a short text description or its control number.

Likely Collection Timeframe: ranges from "anytime" to specific windows of opportunity for collection (for example, related to anticipated time or operational phase requirements).

Source: source of intelligence collection. This may be depicted either by intelligence discipline (for example, SIGNET, ground reconnaissance) or by specific collector (for example, unmanner aerial vehicle, EA-6B, HUMINT exploitation team).

Who Needs Intelligence First: most immediate distribution recipient(s). This may be the original requestor and/or a list of units identified during COA wargaming. Specifically identify each unit by unit name, staff section or node.

Timeliness: (hours, minutes, seconds). Factor in users who need finished analysis and who needs semi-finished, single-source analysis.

Currency: (hours, minutes, seconds): Usually there is a direct proportional relationship between timeliness and currency requirements. Basic intelligence analysts, for example, may need current information for event by event analysis, but their timeliness requirements are less critical than that needed by I&W analysts or the G-3.

Periodicity of Reporting: (days, hours, minutes, seconds or as event occurs): Usually used when reporting surveillance results or tracking critical threat targets or emerging events. Nothing significant to report or negative reports are required unless otherwise directed.

General Product Type: Some examples follow:

- Structured text—usually to fill a database (e.g., order of battle database) or correlator (e.g., electronic intelligence correlator).
- Unstructured text—freeform.
- Raw digital stream—usually to fill a database or correlator.
- Analog voice.
- Digital voice.
- Video (tape or digital stream).
- Raster graphic (scanned/bitmapped photos, maps).
- Vector graphic (vector maps, some imagery products).
- Combination of formats.

Specific/Unique Product Requirements: for each general product type, identify any specific or unique product or format requirements.

Standard Channel(s): identify the primary and first alternate communication channel for standard reporting.

Alarm Channel(s): identify the primary and first alternate communication channel for time-sensitive dissemination.

Quantity: usually only used for hardcopy dissemination. Identify specific quantity for each recipient.

Deliberate Follow-up: identify if positive personal follow-up is required with any recipient subsequent to dissemination. If so, state who is responsible, with whom and when. Such follow-up is typically required when answering a CCIR.

Acknowledge Receipt Necessary? Yes or No. The communications data network may do this automatically.

APPENDIX D
INTELLIGENCE REPORTS
DISSEMINATION MATRIX FORMAT

This appendix provides a sample of an intelligence report dissemination matrix, used to ensure understanding and efficiency in dissemination of intelligence reports. It may be used as an exhibit to Tab E (Intelligence Reports) to Appendix 16 (Intelligence Operations Plan) to Annex B (Intelligence).

INTEL REPORT	ORIGIN	DISSEMINATION METHOD	VIA	COMMS PATH	MEF G-2/IOC FILTER

APPENDIX E
GLOSSARY

Section I. Acronyms

AC/S . . . . . assistant chief of staff
AO. . . . . area of operations

BDA . . . . . battle damage assessment

C2 . . . . . command and control
C2PC. . . . . command and control personal computer
CCIR . . . . . commander's critical information requirements
CE . . . . . command element
CI . . . . . counterintelligence
CIS . . . . . communications and information systems
CM/DO . . . . . collection management/ dissemination officer
COA . . . . . course of action
COC . . . . . combat operations center
COMSEC . . . . . communications security
COP. . . . . common operational picture
CTP . . . . . common tactical picture

DISUM . . . . . daily intelligence summary
DOD . . . . . Department of Defense
DS . . . . . direct support
DSN . . . . . Defense Switched Network
DSNET . . . . . Defense Secure Network

G-1 . . . . . manpower or personnel officer (major subordinate commands and larger organizations)
G-2 . . . . . intelligence officer (major subordinate commands and larger organizations)
G-3 . . . . . operations officer (major subordinate commands and larger organizations)
G-4 . . . . . logistics officer (major subordinate commands and larger organizations)
G-5 . . . . . plans officer (major subordinate commands and larger organizations)
G-6 . . . . . communications and information systems officer (major subordinate commands and larger organizations)
GENSER. . . . . general service

HLZ. . . . . helicopter landing zone
HPT . . . . . high-payoff targets
HPTR . . . . . high-pay off target reporting
HQ. . . . . headquarters
HUMINT . . . . . human intelligence

I&W . . . . . indications and warning
IAS . . . . . intelligence analysis system
ICR . . . . . intelligence collection requirement
IDR . . . . . intelligence dissemination requirement
IOC . . . . . intelligence operations center
IOW . . . . . intelligence operations workstation
INTSUM . . . . . intelligence summary
IPB . . . . . intelligence preparation of the battlespace
IPR . . . . . intelligence production requirement
IR . . . . . intelligence requirement
ISC . . . . . intelligence support coordinator

J-2 . . . . . intelligence directorate of a joint staff
J-6 . . . . . command, control, communications, and computer systems directorate of a joint staff
JDISS . . . . . joint deployable intelligence support system
JIC . . . . . joint intelligence center
JTF . . . . . joint task force
JWICS. . . . . Joint Worldwide Intelligence Communications System

LAN . . . . . local area network
LTIOV . . . . . latest time intelligence is of value

MAG . . . . . Marine aircraft group

MAGTF . . . . . Marine air-ground task force
MARDIV . . . . . Marine division
MARFOR . . . . . Marine Corps Forces
MAW . . . . . Marine aircraft wing
MCDP . . . . . Marine Corps doctrinal publication
MCRP . . . . . Marine Corps reference publication
MCWP . . . Marine Corps warfighting publication
MEF . . . . . Marine Expeditionary Force
MISREP . . . . . mission report
MSC . . . . . major subordinate command

MSE . . . . . major subordinate element

NGO . . . . . nongovernmental organization
NIPRNET . . . . . Nonsecure Internet Protocol Router Network

OIC . . . . . officer in charge
OPLAN . . . . . operation plan
OPORD . . . . . operation order

P&A . . . . . production and analysis
PDA . . . . . physical damage assessment
PERINTSUM . . . . periodic intelligence summary
PIR . . . . . priority intelligence requirement

RFI . . . . . request for information
RRFI . . . . . response to request for information

SALUTE . . . . . size, activity, location, unit, time, and equipment
S-2 . . . . . intelligence officer (units and organizations below the major subordinate command level)
S-3 . . . . . operations officer (units and organizations below the major subordinate command level)
S-4 . . . . . logistics officer (units and organizations below the major subordinate command level)
S-6 . . . . . communications and information systems officer (units and organizations below the major subordinate command level)
SARC . . . . . surveillance and reconnaissance cell
SATCOM . . . . . satellite communications
SCI . . . . . sensitive compartmented information
SCIF . . . . . sensitive compartmented information facility
SIGINT . . . . . signals intelligence
SIPRNET . . . . . SECRET Internet Protocol Router Network
SOP . . . . . standing operating procedure
SSO . . . . . special security officer
SYSCON . . . . . systems control

TDN . . . . . tactical data network
TECHCON . . . . . technical control
TSCIF . . . . . tactical sensitive compartmented information facility

UHF . . . . . ultra high frequency

WAN . . . . . wide-area network

Section II. Definitions

area of operations—An operational area defined by the joint force commander for land and naval forces. Areas of operation do not typically encompass the entire operational area of the joint force commander, but should be large enough for component commanders to accomplish their missions and protect their forces. Also called **AO**. (JP 1-02)

basic intelligence—Fundamental intelligence concerning the general situation, resources, capabilities, and vulnerabilities of foreign countries or areas which may be used as reference material in the planning of operations at any level and in evaluating subsequent information relating to the same subject. (JP 1-02)

battle damage assessment—1. The timely and accurate estimate of damage resulting from the application of military force, either lethal or nonlethal, against a predetermined objective. Battle

damage assessment can be applied to the employment of all types of weapon systems (air, ground, naval, and special forces weapon systems) throughout the range of military operations. Battle damage assessment is primarily an intelligence responsibility with required inputs and coordination from the operators. Battle damage assessment is composed of physical damage assessment, functional damage assessment, and target system assessment. (JP 1-02) **2.** In Marine Corps usage, the timely and accurate estimate of the damage resulting from the application of military force. BDA estimates physical damage to a particular target, functional damage to that target, and the capability of the entire target system to continue its operations. Also called **BDA**. (MCRP 5-12C)

battlespace—All aspects of air, surface, subsurface, land, space, and electromagnetic spectrum which encompass the area of influence and area of interest. (MCRP 5-12C)

collection—In Marine Corps usage, the gathering of intelligence data and information to satisfy the identified requirements. (MCRP 5-12C)

collection asset—A collection system, platform, or capability that is supporting, assigned, or attached to a particular commander. (JP 1-02)

collection management—1. In intelligence usage, the process of converting intelligence requirements into collection requirements, establishing priorities, tasking or coordinating with appropriate collection sources or agencies, monitoring results, and retasking, as required. (JP 1-02)

combatant command—A unified or specified command with a broad continuing mission under a single commander established and so designated by the President, through the Secretary of Defense and with the advice and assistance of the Chairman of the Joint Chiefs of Staff. Combatant commands typically have geographic or functional responsibilities. (JP 1-02)

combat data—Data derived from reporting by operational units. (MCRP 5-12C)

combat information—Unevaluated data, gathered by or provided directly to the tactical commander which, due to its highly perishable nature or the criticality of the situation, cannot be processed into tactical intelligence in time to satisfy the user's tactical intelligence requirements. See also **information**. (JP 1-02)

command and control—1. The exercise of authority and direction by a properly designated commander over assigned and attached forces in the accomplishment of the mission. Command and control functions are performed through an arrangement of personnel, equipment, communications, facilities, and procedures employed by a commander in planning, directing, coordinating, and controlling forces and operations in the accomplishment of the mission. (JP 1-02) **2.** Also in Marine Corps usage, the means by which a commander recognizes what needs to be done and sees to it that appropriate actions are taken. Also called **C2**. (MCRP 5-12C)

commander's critical information requirements—Information regarding the enemy and friendly activities and the environment identified by the commander as critical to maintaining situational awareness, planning future activities, and facilitating timely decisionmaking. Also called **CCIR**. **NOTE**: CCIRs are normally divided into three primary subcategories: priority intelligence requirements; friendly force information requirements; and essential elements of friendly information. (MCRP 5-12C)

commander's intent—A commander's clear, concise articulation of the purpose(s) behind one or more tasks assigned to a subordinate. It is one

of two parts of every mission statement which guides the exercise of initiative in the absence of instructions. (MCRP 5-12C)

commander's planning guidance—Directions and/or instructions which focus the staff's course of action development during the planning process. Also called **CPG**. (MCRP 5-12C)

component—One of the subordinate organizations that constitute a joint force. Normally a joint force is organized with a combination of Service and functional components. (JP 1-02)

coordination—The action necessary to ensure adequately integrated relationships between separate organizations located in the same area. Coordination may include such matters as fire support, emergency defense measures, area intelligence, and other situations in which coordination is considered necessary. (MCRP 5-12C)

counterintelligence—1. Information gathered and activities conducted to protect against espionage, other intelligence activities, sabotage, or assassinations conducted by or on behalf of foreign governments or elements thereof, foreign organizations, or foreign persons, or international terrorist activities. (JP 1-02) **2.** Within the Marine Corps, counterintelligence constitutes active and passive measures intended to deny a threat force valuable information about the friendly situation, to detect and neutralize hostile intelligence collection, and to deceive the enemy as to friendly capabilities and intentions. Also called **CI**. (MCRP 5-12C)

critical information—Specific facts about friendly intentions, capabilities, and activities vitally needed by adversaries for them to plan and act effectively so as to guarantee failure or unacceptable consequences for friendly mission accomplishment. (JP 1-02)

critical intelligence—Intelligence that is crucial and requires the immediate attention of the commander. It is required to enable the commander to make decisions that will provide a timely and appropriate response to actions by the potential or actual enemy. It includes but is not limited to the following: a. strong indications of the imminent outbreak of hostilities of any type (warning of attack); b. aggression of any nature against a friendly country; c. indications or use of nuclear, biological, and chemical weapons (targets); and d. significant events within potential enemy countries that may lead to modification of nuclear strike plans. (JP 1-02)

critical vulnerability—An aspect of a center of gravity that if exploited will do the most significant damage to an adversary's ability to resist. A vulnerability cannot be critical unless it undermines a key strength. Also called **CV**. (MCRP 5-12C)

daily intelligence summary—A report prepared in message form at the joint force headquarters that provides higher, lateral, and subordinate headquarters with a summary of all significant intelligence produced during the previous 24-hour period. The "as of" time for information, content, and submission time for the report will be specified by the joint force commander. Also called **DISUM**. (JP 1-02)

data—Representation of facts, concepts, or instructions in a formalized manner suitable for communication, interpretation, or processing by humans or by automatic means. Any representations such as characters or analog quantities to which meaning is or might be assigned. (JP 1-02)

database—Information that is normally structured and indexed for user access and review. Databases may exist in the form of physical files (folders, documents, etc.) or formatted automated data processing system data files. (JP 1-02)

debriefing—Interviewing of an individual who has completed an intelligence or reconnaissance assignment or who has knowledge, whether through observation, participation, or otherwise, of operational or intelligence significance. (MCRP5-12C)

decision point—An event, area, or point in the battlespace where and when the friendly commander will make a critical decision. Also called **DP**. (MCRP 5-12C)

deliberate planning—A planning process for the deployment and employment of apportioned forces and resources that occurs in response to a hypothetical situation. Deliberate planners rely heavily on assumptions regarding the circumstances that will exist when the plan is executed. (JP 1-02)

descriptive intelligence—Class of intelligence which describes existing and previously existing conditions with the intent to promote situational awareness. Descriptive intelligence has two components: basic intelligence, which is general background knowledge about established and relatively constant conditions; and current intelligence, which is concerned with describing the existing situation. (MCRP 5-12C)

detachment—1. A part of a unit separated from its main organization for duty elsewhere. **2.** A temporary military or naval unit formed from other units or parts of units. (JP 1-02)

direct support—A mission requiring a force to support another specific force and authorizing it to answer directly to the supported force's request for assistance. Also called **DS**. (JP 1-02)

dissemination—Delivery of intelligence to users in a suitable form. (This term and its definition are proposed for inclusion in the next edition of MCRP 5-12C.)

dissemination management—Involves establishing dissemination priorities, selection of dissemination means, and monitoring the flow of intelligence throughout the command. The objective of dissemination management is to deliver the required intelligence to the appropriate user in proper form at the right time while ensuring that individual consumers and the dissemination system are not overloaded attempting to move unneeded or irrelevant information. Dissemination management also provides for use of security controls which do not impede the timely delivery or subsequent use of intelligence while protecting intelligence sources and methods. (MCRP 5-12C)

electronic reconnaissance—The detection, location, identification, and evaluation of foreign electromagnetic radiations. (JP 1-02)

electronic warfare—Any military action involving the use of electromagnetic and directed energy to control the electromagnetic spectrum or to attack the enemy. The three major subdivisions within electronic warfare are electronic attack, electronic protection, and electronic warfare support. Also called **EW**. (JP 1-02)

essential elements of friendly information—1. Key questions likely to be asked by adversary officials and intelligence systems about specific friendly intentions, capabilities, and activities so they can obtain answers critical to their operational effectiveness. (JP 1-02) **2.** Specific facts about friendly intentions, capabilities, and activities needed by adversaries to plan and execute effective operations against our forces. Also called **EEFI**. (MCRP 5-12C)

fires—The effects of lethal or nonlethal weapons. (JP 1-02)

force protection—Actions taken to prevent or mitigate hostile actions against Department of Defense personnel (to include family members), resources, facilities, and critical information. These actions conserve the force's fighting potential so it can be applied at the decisive time and place and incorporate the coordinated and synchronized offensive and defensive measures to enable the effective employment of the joint force while degrading opportunities for the

enemy. Force protection does not include actions to defeat the enemy or protect against accidents, weather, or disease. Also called **FP**. (JP 1-02)

force reconnaissance company—A unit whose mission is to conduct preassault and deep postassault reconnaissance operations in support of a landing force and its subordinate elements. (MCRP 5-12C)

friendly force information requirements—Information the commander needs about friendly forces in order to develop plans and make effective decisions. Depending upon the circumstances, information on unit location, composition, readiness, personnel status, and logistics status could become a friendly force information requirement. Also called **FFIR**. (MCRP 5-12C)

geographic intelligence—The process of collecting, organizing, analyzing, synthesizing, disseminating, and using all-source geospatial and other intelligence information with regard to the military aspects of the terrain in support of MAGTF operations. GEOINT can include cross-country movement studies, line of sight analysis, natural and manmade obstacles, and various terrain studies (e.g., road, railroad, airfield, bridges, ports, helicopter landing zones). Also called **GEOINT**. (This term and its definition are proposed for inclusion in the next edition of MCRP 5-12C.)

global sourcing—A process of force provision or augmentation whereby resources may be drawn from any location/command worldwide. (MCRP 5-12C)

helicopter landing zone—A specified ground area for landing assault helicopters to embark or disembark troops and/or cargo. A landing zone may contain one or more landing sites. Also called **HLZ**. (JP 1-02)

high-payoff target—A target whose loss to the enemy will significantly contribute to the success of the friendly course of action. High-payoff targets are those high-value targets that must be acquired and successfully attacked for the success of the friendly commander's mission. Also called **HPT**. See also **high-value target**. (JP 1-02)

high-value target—A target the enemy commander requires for the successful completion of the mission. The loss of high-value targets would be expected to seriously degrade important enemy functions throughout the friendly commander's area of interest. Also called **HVT**. See also **high-payoff target**. (JP 1-02)

human intelligence—1. A category of intelligence derived from information collected and provided by human sources. (JP 1-02) **2.** In Marine Corps usage, human intelligence operations cover a wide range of activities encompassing reconnaissance patrols, aircrew reports and debriefs, debriefing of refugees, interrogations of prisoners of war, and the conduct of counterintelligence force protection source operations. Also called **HUMINT**. (MCRP 5-12C)

hydrography—The science which deals with the measurements and description of the physical features of the oceans, seas, lakes, rivers, and their adjoining coastal areas, with particular reference to their use for navigational purposes. (JP 1-02)

imagery intelligence—Intelligence derived from the exploitation of collection by visual photography, infrared sensors, lasers, electro-optics, and radar sensors such as synthetic aperture radar wherein images of objects are reproduced optically or electronically on film, electronic display devices, or other media. Also called **IMINT**. (JP 1-02)

indications and warning—Those intelligence activities intended to detect and report time-sensitive intelligence information on foreign developments that could involve a threat to the US or allied and/or coalition military, political, or economic interests or to US citizens abroad. It includes forewarning of enemy actions or intentions; the imminence of hostilities; insurgency; nuclear/non-nuclear attack on the US, its overseas

forces, or allied and/or coalition nations; hostile reactions to US reconnaissance activities; terrorists' attacks; and other similar events. Also called **I&W**. See **information**; **intelligence**. (JP 1-02)

information—1. Facts, data, or instructions in any medium or form. **2.** The meaning that a human assigns to data by means of the known conventions used in their representation. (JP 1-02)

integration—A stage in the intelligence cycle in which a pattern is formed through the selection and combination of evaluated information. (This term and its definition are proposed for inclusion in the next edition of MCRP 5-12C.)

intelligence—1. The product resulting from the collection, processing, integration, analysis, evaluation, and interpretation of available information concerning foreign countries or areas. **2.** Information and knowledge about an adversary obtained through observation, investigation, analysis, or understanding. (JP 1-02) 3. Also, in Marine Corps usage, intelligence is knowledge about the enemy or the surrounding environment needed to support decisionmaking. This knowledge is the result of the collection, processing, exploitation, evaluation, integration, analysis, and interpretation of available information about the battlespace and threat. (MCRP 5-12C)

intelligence annex—A supporting document of an operation plan or order that provides detailed information on the enemy situation, assignment of intelligence tasks, and intelligence administrative procedures. (JP 1-02)

intelligence cycle—The process by which information is converted into intelligence and made available to users. (JP 1-02)

intelligence data—Data derived from assets primarily dedicated to intelligence collection such as imagery systems, electronic intercept equipment, human intelligence sources, etc. (MCRP 5-12C)

intelligence discipline—A well defined area of intelligence collection, processing, exploitation, and reporting using a specific category of technical or human resources. There are seven major disciplines: human intelligence, imagery intelligence, measurement and signature intelligence, signals intelligence (communications intelligence, electronic intelligence, and foreign instrumentation signals intelligence), open-source intelligence, technical intelligence, and counterintelligence. (JP 1-02)

intelligence estimate—The appraisal, expressed in writing or orally, of available intelligence relating to a specific situation or condition with a view to determining the courses of action open to the enemy or potential enemy and the order of probability of their adoption. (JP 1-02)

intelligence operations—The variety of intelligence tasks that are carried out by various intelligence organizations and activities. Predominantly, it refers to either intelligence collection or intelligence production activities. When used in the context of intelligence collection activities, intelligence operations refer to collection, processing, exploitation, and reporting of information. When used in the context of intelligence production activities, it refers to collation, integration, interpretation, and analysis, leading to the dissemination of a finished product. (JP 1-02)

intelligence preparation of the battlespace—1. An analytical methodology employed to reduce uncertainties concerning the enemy, environment, and terrain for all types of operations. Intelligence preparation of the battlespace builds an extensive database for each potential area in which a unit may be required to operate. The database is then analyzed in detail to determine the impact of the enemy, environment, and terrain on operations and presents it in graphic form. Intelligence preparation of the battlespace is a continuing process. (JP 1-02) **2.** In Marine Corps usage, the systematic, continuous process

of analyzing the threat and environment in a specific geographic area. Also called **IPB**. (MCRP 5-12C)

intelligence report—A specific report of information, usually on a single item, made at any level of command in tactical operations and disseminated as rapidly as possible in keeping with the timeliness of the information. Also called **INTREP**. (JP 1-02)

intelligence requirement—1. Any subject, general or specific, upon which there is a need for the collection of information, or the production of intelligence. **2.** A requirement for intelligence to fill a gap in the command's knowledge or understanding of the battlespace or threat forces. (JP 1-02) **3.** In Marine Corps usage, questions about the enemy and the environment, the answers to which a commander requires to make sound decisions. Also called **IR**. (MCRP 5-12C)

joint deployable intelligence support system—A transportable workstation and communications suite that electronically extends a joint intelligence center to a joint task force or other tactical user. Also called **JDISS**. (JP 1-02)

joint force—A general term applied to a force composed of significant elements, assigned or attached, of two or more Military Departments, operating under a single joint force commander. (JP 1-02)

joint intelligence center—The intelligence center of the combatant command headquarters. The joint intelligence center is responsible for providing and producing the intelligence required to support the combatant commander and staff, components, subordinate joint forces and elements, and the national intelligence community. Also called **JIC**. (JP 1-02)

joint intelligence support element—A subordinate joint force forms a joint intelligence support element as the focus for intelligence support for joint operations, providing the joint force commander, joint staff, and components with the complete air, space, ground, and maritime adversary situation. Also called **JISE**. (JP 1-02)

joint operations—A general term to describe military actions conducted by joint forces or by Service forces in relationships (e.g., support, coordinating authority), which, of themselves, do not create joint forces. (JP 1-02)

joint task force—A joint force that is constituted and so designated by the Secretary of Defense, a combatant commander, a subunified commander, or an existing joint task force commander. Also called **JTF**. (JP 1-02)

Joint Worldwide Intelligence Communications System—The sensitive, compartmented information portion of the Defense Information Systems Network. It incorporates advanced networking technologies that permit point-to-point or multipoint information exchange involving voice, text, graphics, data, and video teleconferencing. Also called **JWICS**. (JP 1-02)

Marine Corps Planning Process—A six-step methodology which helps organize the thought processes of the commander and staff throughout the planning and execution of military operations. It focuses on the threat and is based on the Marine Corps philosophy of maneuver warfare. It capitalizes on the principle of unity of command and supports the establishment and maintenance of tempo. The six steps consist of mission analysis, course of action development, course of action analysis, comparison/decision, orders development, and transition. Also called **MCPP**. **NOTE**: Tenets of the MCPP include top down planning, single battle concept, and integrated planning. (MCRP 5-12C)

military operations other than war—Operations that encompass the use of military capabilities across the range of military operations short of war. These military actions can be applied to

complement any combination of the other instruments of national power and occur before, during, and after war. Also called **MOOTW**. (JP 1-02)

multinational operations—A collective term to describe military actions conducted by forces of two or more nations, usually undertaken within the structure of a coalition or alliance. (JP 1-02)

national intelligence support team—A nationally sourced team composed of intelligence and communications experts from either Defense Intelligence Agency, Central Intelligence Agency, National Security Agency, or any combination of these agencies. Also called **NIST**. (JP 1-02)

near real time—Pertaining to the timeliness of data or information which has been delayed by the time required for electronic communication and automatic data processing. This implies that there are no significant delays. Also called **NRT**. (JP 1-02)

noncombatant evacuation operations—Operations directed by the Department of State, the Department of Defense, or other appropriate authority whereby noncombatants are evacuated from foreign countries when their lives are endangered by war, civil unrest, or natural disaster to safe havens or the United States. Also called **NEO**. (JP 1-02)

operational control—Command authority that may be exercised by commanders at any echelon at or below the level of combatant command. Operational control is inherent in combatant command (command authority) and may be delegated within the command. When forces are transferred between combatant commands, the command relationship the gaining commander will exercise (and the losing commander will relinquish) over these forces must be specified by the Secretary of Defense. Operational control is the authority to perform those functions of command over subordinate forces involving organizing and employing commands and forces, assigning tasks, designating objectives, and giving authoritative direction necessary to accomplish the mission. Operational control includes authoritative direction over all aspects of military operations and joint training necessary to accomplish missions assigned to the command. Operational control should be exercised through the commanders of subordinate organizations. Normally this authority is exercised through joint force commanders and Service and/or functional component commanders. Operational control normally provides full authority to organize commands and forces and to employ those forces as the commander in operational control considers necessary to accomplish assigned missions; it does not, in and of itself, include authoritative direction for logistics or matters of administration, discipline, internal organization, or unit training. Also called **OPCON**. (JP 1-02)

operations control and analysis center—Main node for the command and control of radio battalion signals intelligence operations and the overall coordination of MAGTF signals intelligence operations. Processes, analyzes, produces, and disseminates signals intelligence-derived information and directs the ground-based electronic warfare activities of the radio battalion. Also called **OCAC**. (MCRP 5-12C)

order of battle—The identification, strength, command structure, and disposition of the personnel, units, and equipment of any military force. Also called **OOB**. (JP 1-02)

priority intelligence requirements—1. Those intelligence requirements for which a commander has an anticipated and stated priority in his task of planning and decisionmaking. (JP 1-02) **2.** In Marine Corps usage, an intelligence requirement associated with a decision that will critically affect the overall success of the command's mission. Also called **PIR**. (MCRP 5-12C)

production—Conversion of processed information into intelligence through the integration, analysis, evaluation, and interpretation of all source data and the preparation of intelligence products in support of known or anticipated user

requirements. (Term and definition proposed for next edition of MCRP 5-12C.)

production management—Encompasses determining the scope, content, and format of each intelligence product, developing a plan and schedule for the development of each product, assigning priorities among the various production requirements, allocating processing, exploitation, and production resources, and integrating production efforts with intelligence collection and dissemination. (MCRP 5-12C)

reach back—The ability to exploit resources, capabilities, expertise, etc., not physically located in the theater or a joint operations area, when established. (MCRP 5-12C)

reactive target—The method used for targeting targets of opportunity. It is used when time and situation do not allow for targeting; i.e., during deliberate targeting, during an attack, when defending against an attack, or upon discovery of the location of a target such as a radio jammer, tank, or antiaircraft weapon. (MCRP 5-12C)

SECRET Internet Protocol Router Network—Worldwide SECRET level packet switch network that uses high-speed internet protocol routers and high-capacity Defense Information Systems Network circuitry. Also called **SIPRNET**. (JP 1-02)

sensitive compartmented information—All information and materials bearing special community controls indicating restricted handling within present and future community intelligence collection programs and their end products for which community systems of compartmentation have been or will be formally established. (These controls are ever and above the provisions of DOD 5200.1R, *Information Security Program Regulation*.) Also called **SCI**. (JP 1-02)

sensitive compartmented information facility—An accredited area, room, group of rooms, or installation where sensitive compartmented information (SCI) may be stored, used, discussed, and/or electroncially processed. Sensitive compartmented information facility (SCIF) procedural and physical measures prevent the free access of persons unless they have been formally indoctrinated for the particular SCI authorized for use or storage within the SCIF. Also called **SCIF**. (JP 1-02)

sensor data—Data derived from sensors whose primary mission is surveillance or target acquisition, such as air surveillance radars, counterbattery radars, and remote ground sensors. (MCRP 5-12C)

signals intelligence—1. A category of intelligence information comprising either individually or in combination all communications intelligence, electronic intelligence, and foreign instrumentation signals, however transmitted. **2.** Intelligence derived from communications, electronic, and foreign instrumentation signals. Also called **SIGINT**. (JP 1-02)

situational awareness—Knowledge and understanding of the current situation which promotes timely, relevant and accurate assessment of friendly, enemy, and other operations within the battlespace in order to facilitate decisionmaking. An informational perspective and skill that foster an ability to determine quickly the context and relevance of events that are unfolding. (MCRP 5-12C)

surveillance and reconnaissance cell—Primary element responsible for the supervision of MAGTF intelligence collection operations. Directs, coordinates, and monitors intelligence collection operations conducted by organic, attached, and direct support collection assets. Also called **SARC**. (MCRP 5-12C)

tactical intelligence—1. Intelligence that is required for planning and conducting tactical operations. (JP 1-02) **2.** In Marine Corps usage, tactical intelligence is concerned primarily with the location, capabilities, and possible intentions of enemy units on the battlefield and with the tactical aspects of terrain and weather within the battlespace. Also called **TACINTEL**. (MCRP 5-12C)

target—1. An area, complex, installation, force, equipment, capability, function, or behavior identified for possible action to support the commander's objectives, guidance, and intent. Targets fall into two general categories: planned and immediate. **2.** In intelligence usage, a country, area, installation, agency, or person against which intelligence operations are directed. **3.** An area designated and numbered for future firing. **4.** In gunfire support usage, an impact burst that hits the target. Also called **TGT**. (JP 1-02)

target intelligence—Intelligence that portrays and locates the components of a target or target complex and indicates its vulnerability and relative importance. See also **target**. (JP 1-02)

track management—Defined set of procedures whereby the commander ensures accurate friendly and enemy unit and/or platform locations, and a dissemination procedure for filtering, combining, and passing that information to higher, adjacent, and subordinate commanders. (JP 1-02)

warfighting functions—The six mutually supporting military activities integrated in the conduct of all military operations are: **1. command and control—**The means by which a commander recognizes what needs to be done and sees to it that appropriate actions are taken. **2. maneuver—**The movement of forces for the purpose of gaining an advantage over the enemy. **3. fires—**Those means used to delay, disrupt, degrade, or destroy enemy capabilities, forces, or facilities as well as affect the enemy's will to fight. **4. intelligence—**Knowledge about the enemy or the surrounding environment needed to support decisionmaking. **5. logistics—**All activities required to move and sustain military forces. **6. force protection—**Actions or efforts used to safeguard own centers of gravity while protecting, concealing, reducing, or eliminating friendly critical vulnerabilities. Also called **WF**. (MCRP 5-12C)

CHAPTER 1
INTRODUCTION

1. Purpose

This manual is a guide for the use of personnel concerned with signal intelligence (Signal Corps technical intelligence), and should be used in conjunction with FM 30–16.

2. Scope

The manual covers the principal phases of signal intelligence at various echelons. It describes the intelligence responsibilities of the Signal Corps, the mission, organization, and operation of signal intelligence units, and the means and methods of obtaining and processing information to produce signal intelligence (fig. 1).

3. References

Publications and training films pertaining to subjects within the scope of this manual are listed in appendix I.

4. Definitions

Signal intelligence as defined in SR 320–5–1 is to be sharply distinguished from communication intelligence, and electronic intelligence.

a. Signal intelligence is that portion of technical and scientific intelligence that is concerned with signal

and electronic equipment, systems, installations, organizations, doctrines, tactics, and techniques of foreign nations, both military and civil. It is a function of the Signal Corps and a vital element of the overall technical intelligence pattern coordinated by the Assistant Chief of Staff, Intelligence (ACSI).

b. Communication intelligence consists of information obtained by intercepting enemy traffic and by applying electronic position finding techniques to enemy radio and radar stations. It also includes the study of the enemy's communication means, procedures, and security systems. This form of intelligence lies outside the scope of this manual. It is not a function of the Signal Corps.

c. Electronic intelligence is the collection and the technical processing for intelligence purposes, of information on non-communications, electro magnetic radiations emanating from other than atomic detonation sources. This form of intelligence functioning is not a responsibility of the Signal Corps.

5. Objectives of Signal Intelligence

The objectives of signal intelligence are—

a. To provide the army with signal intelligence concerning the vulnerability and capability of foreign communication systems, both civil and military.

b. To provide the army with signal intelligence required for the prompt and efficient use of captured signal equipment and communication systems.

c. To provide research and development laboratories with technical intelligence for possible application in developing new signal equipment and electronic countermeasures devices.

d. To provide staff officers with signal intelligence for possible inclusion in long-range strategic planning.

e. To arrive at an estimate of a foreign nation's military capabilities in the field of telecommunication, at both tactical and strategic level.

CHAPTER 2

SIGNAL INTELLIGENCE RESPONSIBILITIES

6. General

The Signal Corps is responsible for supplying signal intelligence to the Department of the Army (DA), to theater commanders, and to other authorized agencies. To meet its responsibility in this respect, the Signal Corps—

a. Trains specialists in methods of collecting and processing signal information.

b. Directs the prompt and complete study of captured signal equipment, supplies, installations, and documents, to abstract information of both tactical and strategic value.

c. Studies foreign research and development activities in the fields of radio, wire, radar, television, photography, sound and visual communication, meteorological instrumentation, radio beacons, and other communication equipment and services.

d. Maintains signal intelligence liaison with other branches.

7. Chief Signal Officer

a. Under the general supervision of the AC of S, Intelligence, the Chief Signal Officer (CSigO) controls all signal intelligence operations. The staff intelligence element of Office of the Chief Signal Officer is responsible for advising the CSigO, all staff and technical

divisions of OCSigO, and all field activities of OCSigO, on signal intelligence matters; for maintaining liaison with ACSI on technical intelligence affecting the Signal Corps; and for exercising staff supervision over field intelligence activities of the Signal Corps.

b. The Signal Corps Intelligence Agency (SCIA) is the principal field intelligence activity. The SCIA is responsible for—

(1) Producing, and keeping current files of information and intelligence for the use of both the Signal Corps and the Office of the ACSI. This includes intelligence concerning all activities in all foreign countries which parallel the U.S. Army Signal Corps, such as:

(*a*) Foreign equipment design, performance, manufacture, storage, maintenance, capabilities, and limitations.

(*b*) Foreign military communication organizations, installations, signal doctrines and techniques.

(*c*) Foreign civilian communication facilities: their nature, operating characteristics, capabilities, limitations, vulnerabilities, and military use potential, including the effects of weather, terrain, and other environmental factors.

(2) Disseminating intelligence to ACSI and to elements of the Signal Corps.

(3) Exercising technical supervision over the collection and use of signal intelligence information in theaters of operation.

(4) Processing and abstracting information from

foreign equipment received from oversea theaters.

(5) Originating and processing collection requirements for signal information and foreign signal equipment and supplies and forwarding them to ACSI for consideration at that level, or concurrently through channels, to appropriate Signal Corps elements in theaters of operation.

(6) Training personnel and units for specialization in technical analysis and the preparation of technical reports, studies, and estimates.

8. Theater, Field Army, and Corps Signal Officers

Theater, field army, and corps signal officers are responsible for—

a. Providing their respective commanders with accurate and timely signal intelligence. This is accomplished by producing and maintaining signal intelligence reports and studies, and by acquiring, producing and maintaining information and intelligence concerning foreign signal materiel, communication installations, facilities, and other fields of interest to the Signal Corps. Signal intelligence operations are coordinated with the technical requirements of G2.

b. Providing technical supervision of signal intelligence personnel in the collection, examination, and reporting on captured enemy signal materiel, communication installations, and facilities in accordance with policies and priorities established by G2.

c. Maintaining estimates of the enemy signal situation.

d. Insuring the proper dissemination of signal intelligence concurrently through the G2 and Signal Corps technical channels, except for that required exclusively for the Signal Corps.

e. Determining the extent to which captured enemy signal installations and materiel can be exploited by friendly troops.

f. Developing techniques and preparing directives for the collection of information on enemy signal installations and materiel.

g. Forwarding signal intelligence files to the SCIA upon the deactivation of assigned intelligence units.

h. Training signal personnel and units for specialization in technical analysis and the preparation of signal intelligence reports and studies.

i. Implementing and operating the system of evacuation of captured signal materiel.

j. Advising the G2 on signal technical matters and providing such assistance as may be required.

k. Providing information for training of signal personnel to foreign signal materiel to include recognition characteristics, use, and interchangeability with United States or allied signal equipment.

9. Division Signal Officer

The division signal officer supervises signal intelligence activities at division level. His duties include the dissemination of signal intelligence to higher, lower, and lateral headquarters, in conformance with G2 policy.

10. Signal Intelligence Officers

Any Signal Corps officer may—by reason of his training or his association with military or signal

intelligence activities—be selected as a signal intelligence officer. He may serve in a dual capacity, as commander of a signal intelligence unit under the operational control of the staff signal officer, and as a staff member of the signal section of the command to which he is assigned or attached. Under the direction of the staff signal officer and in accordance with G2, his responsibilities may include any or all of the following:

a. Training personnel in signal intelligence practices.

b. Evacuating captured signal equipment for intelligence purposes.

c. Training personnel in the characteristics of enemy signal equipment and its interchangeability with, or adaptability to, our own equipment.

d. Exploiting signal intelligence derived from captured maps, diagrams, and other signal intelligence targets.

e. Interrogating captured enemy signal personnel.

f. Reviewing interrogation reports for the purpose of directing additional technical interrogation of specially qualified prisoners of war (POW).

g. Implementing that portion of the collection plan that pertains to the Signal Corps' field of interest.

h. Preparing or supervising the preparation of field reports.

i. Collecting information and producing signal intelligence concerning foreign signal materiel, communication facilities, and installations required by the staff signal officer for fulfillment of G2's requirement.

11. Signal Intelligence Units

Signal Corps intelligence units are normally assigned or attached to corps, army, theater, or certain types of logistical commands. The units are responsible for exploiting any signal situation or captured signal equipment, supplies, documents, and other material that may expedite the immediate tactical mission or aid in long-range strategic planning. These units are described in paragraphs 17 through 22.

12. Signal Units

In addition to general intelligence responsibilities common to all combat and service units, signal units at all levels have specific technical responsibilities in assisting signal intelligence personnel and intelligence officers. These responsibilities normally include:

a. Reporting the capture of enemy signal installations to the nearest signal intelligence unit or officer. This report should include all available information pertaining to the location, quantity, condition, design, identification, manufacture, operation, and maintenance of equipment.

b. Safeguarding captured supplies and equipment to an extent consistent with the assigned mission of the unit.

c. Destroying captured equipment when recapture by the enemy is imminent.

d. Reporting information pertaining to captured cryptographic materiel to agencies concerned with communication intelligence and security.

13. Other Units

a. Although signal intelligence is the direct concern of specially organized units and agencies, all unit commanders should impress upon their personnel

the necessity for recognizing and reporting promptly any information pertaining to signal intelligence. By such action, individuals contribute to the production of signal intelligence and to the accomplishment of major military objectives.

b. Individuals may obtain information accidently while performing a routine mission or they may be directed to seek some particular item of information through reconnaissance or other means. In either case, considerable initiative is required. In reporting and processing information, no detail should be omitted. Information that seems unimportant at first glance or during initial processing may assume primary importance when correlated with other information. The value of information is increased when the circumstances concerning its origin—including the time it was obtained—are known. Failure to report these circumstances often renders the information valueless.

c. Individuals must also be able to recognize and report negative information. Knowledge of enemy inactivity in a given direction may have great intelligence value.

14. Intelligence Officers

Intelligence officers at all echelons are responsible for the coordination of all functions pertaining to technical intelligence. Where appropriate, intelligence sections of the general staffs of higher headquarters may have a technical intelligence officer assigned or attached to assist the G2 with the technical intelligence plan and the staff coordinating effort. At corps level and higher, the G2 is usually assisted by a technical intelligence staff officer for the purpose of supervising collection activities of a technical and scientific nature. This coordinator does not supersede the signal officer, who continues to function as the commander's technical advisor. Specific duties of the various intelligence officers are outlined in publications listed in appendix I.

CHAPTER 3
SIGNAL INTELLIGENCE ORGANIZATION

Section I. SIGNAL CORPS INTELLIGENCE AGENCY

15. General

The SCIA is a class II activity under the control of the Chief Signal Officer through the staff intelligence element of the OCSigO. The SCIA:

a. Coordinates the collection of signal intelligence.

b. Evaluates and correlates the information received.

c. Prepares signal intelligence studies.

d. Disseminates intelligence information through Signal Corps command and technical channels.

e. Maintains a research and reference service for technical signal intelligence.

f. Provides assistance on matters of organization and training of Signal Corps intelligence units.

g. Maintains liaison with other intelligence activities.

16. Operations

The SCIA:

a. Evaluates and interprets information and produces intelligence on foreign communications systems and equipment, both civilian and military.

b. Evaluates and interprets information concerning foreign electronic research and development, as well as the natural and industrial resources that provide the civilian and military communication installations, equipment, and supplies of foreign nations.

c. Exploits intelligence derived from studies of captured communication equipment and scientific information.

d. Prepares bibliographies concerning signal intelligence information required by a theater or task force signal officer.

e. Produces and maintains current intelligence concerning technical details and performance data of captured materiel.

f. Assists in the planning, activating, and training of signal intelligence units.

g. Supervises the processing and distributing of captured signal materiel as directed by the Chief of Staff, U.S. Army, to meet training requirements within the CONUS.

h. Supervises the preparation of signal intelligence manuals and training aids.

i. Disseminates completed intelligence to agencies under control of the Chief Signal Officer and supervises the transmission of such intelligence to the ACSI.

Section II. SIGNAL INTELLIGENCE UNITS

17. General

Signal Corps intelligence units are employed in the field to procure and process information promptly and to disseminate the resultant intelligence. These units serve as the basic operating and coordinating elements of signal intelligence activities.

18. Mission

Signal intelligence units are normally assigned or attached to the various echelons of command as required. These units are under the operational control of the signal officer of the command and are under the staff supervision of the appropriate G2. The general mission of the units are:

a. Collection of foreign electronic and communication equipment and materiel; study of their components, use, effectiveness, and intelligence value, including research and development; selecting, reporting, and evacuating foreign equipment and materiel for intelligence purposes, including research and development.

b. Identifying, photographing, and reporting foreign telecommunication installations, electronic equipment, documents (in coordination with G2) and similiar materiel required for signal intelligence purposes.

c. Assisting in the location, evaluation, intelligence exploitation, and reporting on foreign Signal installations and facilities, personnel, and agencies. Other activities of interest are those associated with or contributing to the planning, design, research and development, testing and production, storage, and maintenance of signal equipment. Construction of signal installations and other facilities that would be of interest to signal intelligence are also included.

d. Conducting signal intelligence exploitation of information repositories, in coordination with G2, and participating in the production and maintenance of intelligence peculiar to the needs of the Signal Corps.

e. Assisting in or conducting training of units in the special responsibilities and techniques by which those units may aid the signal technical intelligence collection effort.

19. Organization

a. There are five types of signal intelligence teams organic to a theater. These teams—TA, TB, TC, TD, and TE—are organized and equipped in accordance with TOE 11–500R. There is also a sixth type—Signal Technical Intelligence Team (class II)—attached to a major ovearsea command.

b. Each team has at least one signal intelligence officer assigned to it.

c. When required, any of these units can be augmented by administrative, mess, and automotive maintenance teams from TOE 11–500R.

20. Theater Headquarters

The TE-type team is normally attached or assigned to the theater or to a type C logistical command (fig. 2). This team—

a. Coordinates the activities of the TA-, TB-, TC-, and TD-type teams.

b. Disseminates signal intelligence within the theater of operations., in accordance with G2 dissemination policy.

c. Supervises the storage, issue, and shipment to CONUS of collected communication material.

21. Army

One TC-type team and one TD-type team are normally allocated to a field army or to a type C logistical command (fig. 3).

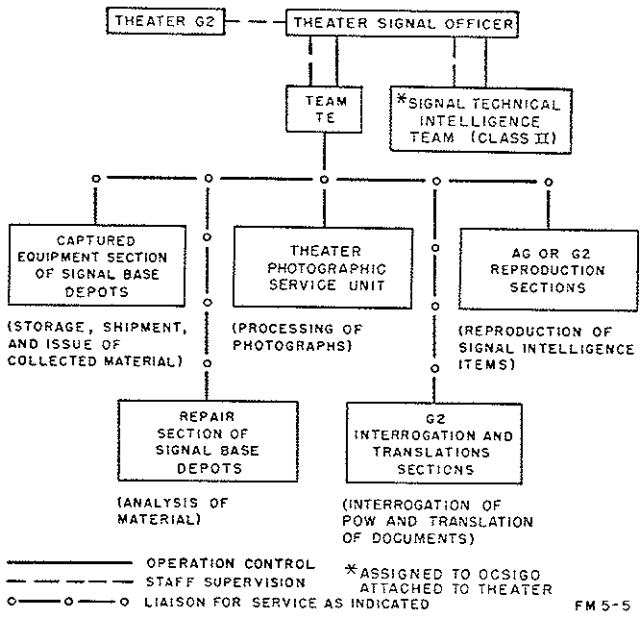

Figure 2. Signal intelligence teams at theater.

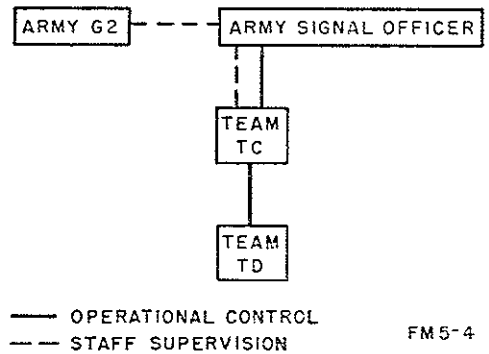

Figure 3. Signal intelligence teams at army.

a. Team TC. This team—

(1) Coordinates the activities of the TA-, TB-, and TD-type teams.

(2) Supervises the storage, issue, processing, and shipment to the rear of collected communication materiel.

b. Team TD. This team—

(1) Performs technical examination and evaluation of fixed plant communication installations and other special communication installations and equipment.

(2) Recommends the disposition of these signal installations.

22. Corps

One TA-type team and two TB-type teams normally are allocated to the headquarters of each corps or to a type B logistical command (fig. 4).

a. Team TA. This team—

(1) Coordinates the activities of two or more collection teams TB.

(2) Processes intelligence reports and forwards them to higher headquarters, within limitations of G2 policy.

(3) Provides the necessary liaison between the signal officer of the command and the G2.

b. Teams TB. These teams—

(1) Accompany advance combat elements for the capture of special communication targets.

(2) Tour afterbattle areas for the purpose of locating and safeguarding signal equipment abandoned by the enemy.

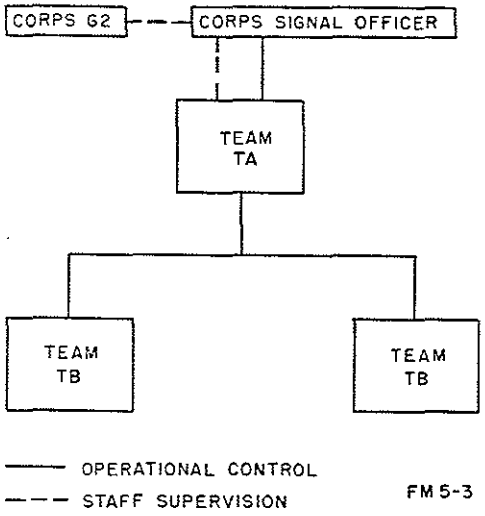

Figure 4. Signal intelligence teams at corps.

(3) Collect, photograph, and identify items of captured signal materiel.

(4) Prepare spot reports on all items collected.

(5) Process and evacuate, through team TA, items of signal intelligence.

CHAPTER 4
SIGNAL INTELLIGENCE OPERATIONS

Section I. PLANNING

23. General

Signal intelligence planning is designed to expedite the collection and exploitation of signal information and intelligence. It is a systematic process that follows a prescribed form as outlined in FM 30–16. When initial operational planning has been completed and the estimate of the signal situation has been formulated, the signal intelligence operational plan can take shape. It is based on the G2 technical intelligence and collection plans and is primarily concerned with the signal intelligence collection mission.

24. Technical Intelligence Plan

a. The theater technical intelligence plan is prepared by the theater G2 in coordination with the theater chiefs of technical services. Lower level supporting plans are prepared by the appropriate G2 in coordination with the technical service special staff officers.

b. The technical intelligence plan encompasses the operations of all technical intelligence personnel. It covers—

(1) Collection and processing of technical intelligence information.

(2) Handling of foreign materiel.
(3) Dissemination of technical intelligence.
(4) Organization for an intelligence task force operation.
(5) Employment of technical service intelligence units.

25. Collection Plan

The collection plan is prepared by the G2 to direct the overall collection program. It is prepared to cover any specific period of operation and is modified when necessary to conform to new requests and decisions made by the commander as the operation develops. The collection scheme outlined by the plan is based on an analysis of the *essential elements of information* (EEI) required by the commander.

26. Coordination of Plans

All signal intelligence planning must be coordinated with the commander's immediate plan of operation and with the G2 technical intelligence plan. At corps, army, and theater headquarters, the G2 keeps the planning section—including the signal officer—advised of all matters pertaining to enemy or indigenous communications. In turn, the signal officer keeps the G2 informed of all pertinent activities of the signal intelligence teams. At division level, the G2 coordinates his planning with the division signal officer, who coordinates with the corps signal officer and with any corps signal intelligence personnel operating within the division area.

Section II. SOURCES OF SIGNAL INFORMATION

27. General

The reliability of the *source* of any intelligence information must be carefully evaluated. The accuracy of the information itself must also be carefully evaluated by comparison with known facts. When a human factor is involved, the evaluation of the source becomes particularly important. For example, overzealous local inhabitants, in an effort to please, may give distorted information. Or the enemy may plant false deserters to deliberately distort intelligence information. Some of the more common sources of technical signal information are—

a. Captured signal equipment and installations.
b. Local inhabitants.
c. Captured enemy personnel.
d. Captured photographs, charts, diagrams, manuals, weather and terrain maps, and other documents.
e. Aerial and ground photographs made by friendly forces.
f. Weather and terrain maps made by friendly forces.

28. Captured Signal Equipment and Installations

Captured signal equipment and installations—both military and civilian—may be the best sources of technical signal information available in a theater of operations. Such information may be of technical, tactical, and strategic value. By analysis of this information:

a. Use of the equipment may be determined and effective countermeasures may be developed.

b. It may be established whether or not the enemy is in short supply of certain strategic materials.

c. It can be learned when, where, and how many units of the equipment were produced.

d. Superior qualities of workmanship may be studied and parts may be introduced into our own equipment for increased efficiency.

e. A basis may be established for the production of training literature to instruct friendly troops in the use of enemy equipment.

29. Local Inhabitants and Enemy Personnel

a. Local inhabitants of an area of operation may be willing sources of information. One of the best sources of information is the personnel of underground organizations, who are usually trained for specific information-collecting missions.

b. If skillfully interrogated, POW's may willingly or inadvertently divulge information. Technicians who have become prisoners may unintentionally reveal information because of their interest in the technical aspects of certain equipment. Prisoners may be carrying personal or official documents that furnish new information or confirm information already on hand. In addition to data on troop dispositions, communication lines, arms and equipment, information on the morale of the enemy, and the effects of psychological warfare can be obtained from prisoners.

30. Photographs

Official aerial and ground photographs may provide reliable information on the enemy's equipment, use of terrain, indigenous facilities, and lines of communication. Such photographs suggest profitable targets for specialized technical intelligence team assignments.

31. Miscellaneous

Other sources of information include such things as—

Weather forecasts and studies.
Strategic and tactical terrain surveys.
Reference data.
Studies prepared by other intelligence agencies.

Section III. COLLECTION OF SIGNAL INFORMATION

32. Introduction

Collecting captured signal equipment is one of the most important parts of the signal intelligence program. However, the program may be delayed or negated if the captured equipment is not handled and processed correctly.

a. Up to and including division, the collecting opportunities are mainly for individuals or teams whose collection activities are curtailed both by the time factor and the tactical situation. Their efforts are restricted mainly to the collection of tactical signal information.

b. At echelons above division, the information trend gradually shifts from tactical to strategic. Intelligence personnel at corps, army, and theater have more time to search larger installations and facilities.

c. To collect signal information at any level, it is necessary to know *what* to look for and *where* to find it. Basic intelligence operations and doctrine—applicable to all types of intelligence work—are

treated in detail in pertinent publications listed in appendix I.

33. Fields of Interest

Signal intelligence is concerned with information pertaining to—

Radio equipment.
Wire equipment.
Sound and visual communication equipment.
Facsimile equipment.
Television equipment.
Ground radar and recognition equipment.
Direction-finding equipment.
Power and auxiliary equipment.
Photographic equipment.
Meteorological equipment.
Proximity fuses.
Radiological detection devices.
Electronic countermeasures equipment and devices.
Guided missile guidance and control systems.

34. Targets

Any nation normally has characteristic procedures for the location of equipment and documents and for the storage and issue of supplies. Peculiarities of procedures should be studied by signal intelligence personnel. Collection methods based on such studies greatly facilitate the signal intelligence effort. Certain aspects of signal intelligence are of tactical value, certain others are of strategic value, and many overlap both fields. Tactical and strategic equipment and information are usually found in the following locations:

a. Tactical.

(1) Forward observation points.
(2) Command posts.
(3) Unit headquarters.
(4) Communication centers.
(5) Unit supply agencies and facilities.
(6) Artillery positions.
(7) Various types of signal units operating in the forward areas.

b. Strategic.

(1) Unit headquarters.
(2) Other military installations.
(3) Communication centers.
(4) Radio stations.
(5) Radar stations.
(6) Power stations.
(7) Meteorological stations.
(8) Telephone and telegraph switching centers.
(9) Laboratories, research centers, and experimental stations.
(10) Supply warehouses and storage dumps.
(11) Police and security headquarters.
(12) Railroad stations, railheads, rail centers, and other logistical control points.
(13) Civilian industrial installations.

35. Selection of Equipment and Documents for Evacuation

a. Captured equipment for evacuation should be carefully selected, and, as a rule, only those items in

the best condition should be forwarded to higher headquarters for evaluation. Quantities of equipment in excess of intelligence requirements are evacuated through normal signal supply channels. Signal documents, wherever found, should be evacuated for evaluation purposes.

b. When possible, only equipment having all of its component parts or units should be selected for intelligence purposes. Where a complete set of equipment is not available, an attempt should be made to assemble a complete set by using sound parts from damaged equipment of the same type. To determine how many pieces make up a complete set or how parts or components fit together, captured enemy signal personnel may be interrogated by arrangement with the intelligence section of the responsible headquarters.

36. Photographic Coverage

If possible, equipment and documents to be collected for intelligence purposes are photographed intact *before removal.* These photographs are made inclosures to the report relating to the collected item.

37. Equipment Tag

Frequently an item cannot be evacuated immediately. To prevent duplication of effort and to deter appropriation by souvenir hunters, the equipment is tagged as having been inspected or earmarked for collection. A typical equipment tag is shown in figure 5.

a. The tag designates the item for further signal intelligence processing, gives pertinent information concerning the item, and prevents it from being sent to disinterested agencies.

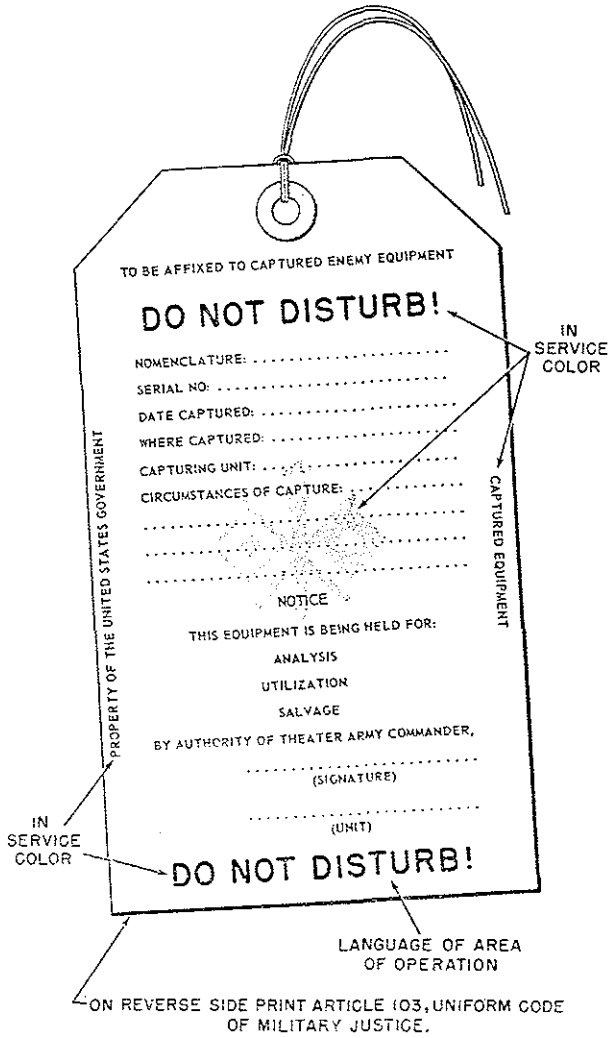

Figure 5. Typical equipment tag.

b. The tag should include Article 103 of the Uniform Code of Military Justice and provide space for the following information:

(1) Nomenclature and type number, if any.
(2) Serial number.
(3) Date, place, and circumstances of capture.
(4) Equipment identification.
(5) Notice of intended use.
(6) Authority for collection.
(7) Signature of person preparing the tag and designation of his unit.
(8) Other identifying information.

38. Collection at Different Echelons

Most of the collection of signal intelligence is done at corps level by TB collection teams, under the direction of the TA team. At army level, the TC signal intelligence team and the TD equipment evaluation team collect much less equipment and material—their major effort is in the processing of intelligence materiel collected and forwarded from corps. At theater level, collection is practically nonexistent. The flow of signal intelligence material and reports is shown in figure 6.

39. Guides to Collecting Signal Information

The amount and kind of signal intelligence to be collected differs according to whether the captured installation is military or civilian. Checklists aid individuals, teams, or other collection agencies during inspection of such installations. DA Pam 30–100 is an excellent instrument to aid all collecting agencies concerned with signal intelligence.

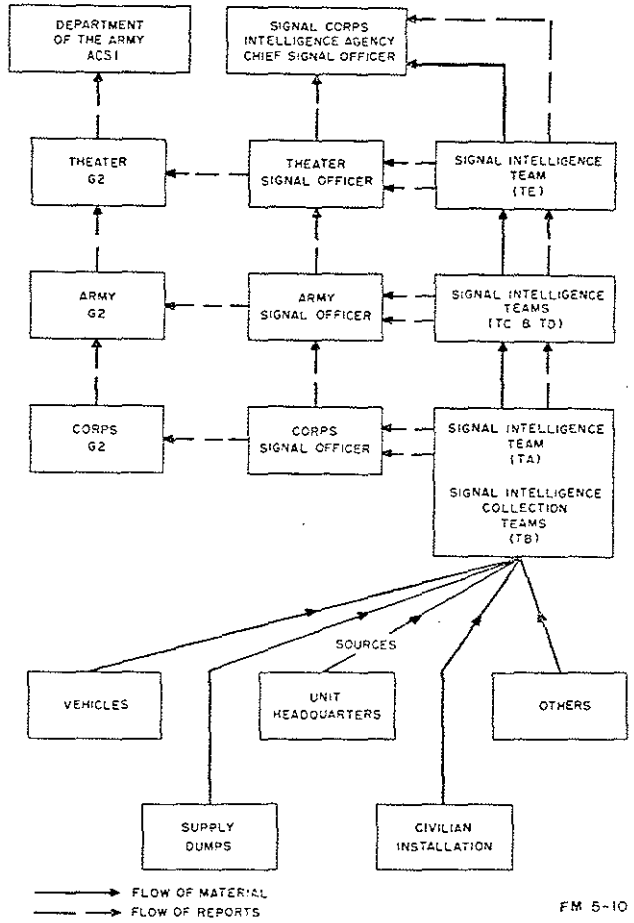

Figure 6. Flow of signal intelligence material and reports.

40. Checklist for Collecting Military Communication Information

a. Organization and Equipment of Enemy Units.

(1) Signal equipment in use by each military unit.

(2) Qualifications of personnel in enemy communication units.

(3) Communication specialist shortages.

(4) Communication terminology and map symbols.

(5) All documents pertaining to military communication and communication equipment.

b. Methods of Operation.

(1) Responsibility within the unit.

(2) Responsibility to higher units.

(3) Responsibility to lower and adjacent units.

(4) Types of radio and wire nets in use.

(5) Types of communication in use—such as telephone, telegraph, visual, and messenger facilities.

c. Telephone and Telegraph Equipment.

(1) Switchboards.

(2) Carrier and repeater equipment.

(3) Users' equipment—such as telephone, telegraph, and teletypewriter end instruments.

(4) Line materials.

(5) Line routes.

(6) Auxiliary equipment—such as power supplies, test equipment, and tools.

d. Radio Equipment.

(1) Transmitters and receivers.

(2) Remote control equipment.

(3) Antennas.

(4) Vacuum tubes and component parts.

(5) Direction-finding equipment.

(6) Special equipment, such as tone keyers, demodulators, special multiplexers, and converters.

e. Radar Equipment. Use the same checklist as for radio equipment (*d* above).

f. Meteorological and Navigational Equipment.

(1) Measuring devices.

(2) Recording devices.

(3) Special radio equipment (use checklist in *d* above).

g. Photographic Equipment.

(1) Cameras.

(2) Film.

(3) Processing equipment.

h. Other Equipment. Any other equipment used or controlled by the Signal Corps—such as visual, sonic, infrared, and flash ranging equipment.

41. Checklist for Collecting Information on Nonmilitary Civilian Communication Facilities

a. Wire Facilities.

(1) Name and location.

(2) Description.

(3) Amount, type, and capacity of equipment.
(4) Interconnection with other systems.
(5) Condition and recommendations.
(6) Outside plant.
(*a*) Open wire lines—poles, pole fixtures, number of circuits, wire gage, and transpositions.
(*b*) Aerial cable—poles, method of suspension, conductor gage and composition, and number of pairs.
(*c*) Underground cable—method and depth of laying, conductor gage and composition, and number of pairs.

b. Radio Facilities (Including Broadcasting Stations).

(1) Name and location.
(2) Description.
(3) Antenna installation.
(4) Station equipment—nomenclature of radio sets and auxiliary equipment.
(5) Current operational condition.
(6) Individual items of equipment—complete description of each item.

Section IV. SOUVENIR CONTROL

42. Introduction

Souvenir control is important to the general military intelligence mission for the prevention of unauthorized acquisition, mutilation, or cannibalization of captured enemy equipment, documents, and supplies. The need for this control is proportionate to the amount of damage that souvenir hunting may do to the intelligence effort. In combat areas, strict souvenir control is an immediate and continuing requirement.

43. Reasons for Control

a. Successful intelligence processing of captured equipment and information—both military and civilian—is expedited when the materiel is obtained in its entirety. Removal, by souvenir hunters, of any equipment components, documents, or photographs may break or prolong the intelligence process and delay vital intelligence functions.

b. Unwarranted rummaging through captured equipment and documents hampers the intelligence mission by complicating the collecting and processing of information.

c. Identifying data on captured equipment are often as vital to the success of an intelligence mission as the equipment itself. When souvenir hunters remove tags or nameplates from captured equipment, they needlessly complicate the job of intelligence personnel.

44. Signal Equipment Control

Captured signal equipment attracts the attention of equipment scavengers, as well as that of souvenir hunters.

a. Stringent controls must be exerted over captured optical equipment such as cameras, lenses, prisms, meteorological instruments, theodolites, range finders, tracking and sighting devices, and binoculars. Strict control over this type of equipment is necessary because of its small size, general attractiveness, and ease of acquisition.

b. Controls are also required over captured com-

munication equipment, such as radio sets, teletypewriters, repeaters, switchboards, and other apparatus. This equipment constitutes valuable sources of information and must not be removed, disassembled, or dismantled by unauthorized personnel.

c. Communication centers, facilities, supply depots, and technical installations seized by combat elements or an intelligence task force warrant particular precautions and provisions to prevent unintentional destruction by combat troops, delayed enemy demolition, looting, or removal by souvenir hunters. If necessary, a guard unit from an appropriate rear area organization should be provided. Since combat troops must be released as soon as the target is out of proximity to the enemy, another unit must provide normal interior guard. This may be accomplished by the provost marshal or by drawing troops from Signal Corps units, which should be prepared to remain until duly relieved.

45. Dangers of Souvenir Hunting

The individual soldier must be made to realize the dangers of souvenir hunting both to himself and to his command.

a. Booby traps present the greatest immediate personal danger to the souvenir hunter. When souvenir discipline is relaxed, the enemy will make expeditious use of this knowledge, and excessive casualties may result. Developments in chemical, bacteriological, and radiological warfare methods tend to make souvenir hunting an increasingly more dangerous activity.

b. The unwarranted destruction of captured equipment, supplies, and installations by friendly troops engaged in souvenir hunting deprives friendly forces of certain materiel that might be urgently needed for research, and also deprives intelligence personnel of potentially important sources of information.

46. Responsibility

The unit commander is responsible for the enforcement of souvenir control regulations. To stimulate interest in the collection effort, commanders must implement directives from higher headquarters governing the return of trophies turned in by members of their commands. Items that cease to be of military value should be returned to individuals after approval of G2, with a certificate, in duplicate, authorizing their retention.

47. Authority

The primary authority for souvenir control is contained in Article 103 of the Uniform Code of Military Justice. It states that enemy property—both military and civilian—becomes the property of the United States immediately upon its capture, and must not be sold or otherwise disposed of without proper authority. During combat operations, DA regulations are frequently issued to cover particular situations and to clarify control procedures relative to individual items of equipment.

Section V. PROCESSING OF SIGNAL INFORMATION

48. General

Processing includes the collation, evaluation, and interpretation of collected information. At corps

level, processing plays a relatively minor role, with increasing importance at army and theater levels. At army, it consists primarily of collating equipment and information received from teams attached to corps and from individuals and units operating below corps level, and forwarding this to theater. At theater, processing assumes a major role in the development of materiel and information into usable and timely intelligence.

49. Collation

Signal information is collated to keep data of the same categories together for convenience of selection. comparison, and coordination. In the collation of information, no facts can be disregarded. Items that seem trivial at first glance may assume primary importance upon comparison with other facts.

50. Evaluation

An item of information must be appraised in order to determine its pertinence, the reliability of the source or agency, and the accuracy of the information. A close and expeditious examination of the received information establishes its degree of relevancy and its possible value. The reliability of the source and collecting agency is also determined before the information can be evaluated. The accuracy or truth of the information itself must be determined separately from the reliability of the source and agency. The rating of the information is done in accordance with pertinent paragraphs of FM 30–5.

51. Interpretation

Interpretation is the critical analysis of the evaluated information to determine its significance with respect to information or intelligence already at hand. There are two phases to consider—first, establishing the conformity or nonconformity of new information with existing information, and second, determining its significance.

a. The purpose of interpreting signal information is not to draw conclusions as to the enemy's communication capabilities or probable courses of action, but to establish accurately the facts of the enemy situation. Proper interpretation of collected information results in intelligence that is accurate and concise, free from irrelevant matter, and ready for immediate use.

b. The probable significance of processed information must be determined in terms of past, present, and future factors. When the reliability of the source and the accuracy of an item of information have been established, the question arises as to what the information means in the light of other available information. In answering this question, important points to consider are—

(1) Does the item alter or add significance to any information previously received?
(2) Does the information tend to confirm the estimate of the enemy situation or does it tend to indicate that the estimate is incorrect?
(3) Does the information suggest that any previous information was purposely planted by the enemy for deception?

52. Processing at Corps

At corps level, processing consists principally of consolidating the information and materiel obtained

by the collection teams and other sources. It includes the intermediate steps of preparing equipment and documents for shipment to army and the dissemination of reports of immediate tactical value to the interested agencies.

53. Processing at Army

In addition to coordinating the activities of the teams attached to lower echelons, signal intelligence personnel at army level are responsible for forwarding to theater headquarters enemy signal materiel that is not authorized for retention within the army command. Equipment arriving from field collecting agencies is checked and identified for purposes of signal intelligence and for possible issue to troops. Technical installations and equipment bypassed by combat units are exploited for intelligence purposes. This is done by team TD, which analyzes and recommends disposition or use of the installation or equipment. Copies of this equipment evaluation report are disseminated to interested agencies.

54. Processing at Theater

At theater level, processing is a detailed operation that includes the steps of collation, evaluation, and interpretation. Actual procedures depend upon the signal intelligence officer, the theater signal officer, and the theater G2. In addition, signal intelligence processing activity at this level includes the supervision of the packing and shipment to CONUS of captured signal equipment in such quantities as may be required for intelligence purposes. The details of equipment evacuation are explained in applicable manuals (app. I).

Section VI. DISSEMINATION OF SIGNAL INTELLIGENCE

55. Requirements

Dissemination of signal intelligence (fig. 7) is as essential as any of the steps in its processing. Signal intelligence is of no value unless it reaches the individuals or units concerned in time to serve its purpose. To meet this requirement, dissemination of intelligence must be:

a. Specific and timely.

b. Adequate to fill the needs of the situation.

c. Broad enough to assure that the information is received by all interested agencies but limited enough to prevent its reception by agencies not requiring the information.

d. In such form that the recipients may rapidly locate details of interest to them.

e. Disseminated in accordance with established AC of S Intelligence or G2 dissemination policy at each command echelon.

56. Department of the Army

The SCIA disseminates signal intelligence outside the Signal Corps to all interested agencies authorized to receive such intelligence after approval by the Office of the Assistant Chief of Staff, Intelligence, Department of the Army. Technical bulletins and other reports are distributed through command channels to theaters of operations as required.

57. Theater

The major signal intelligence dissemination effort

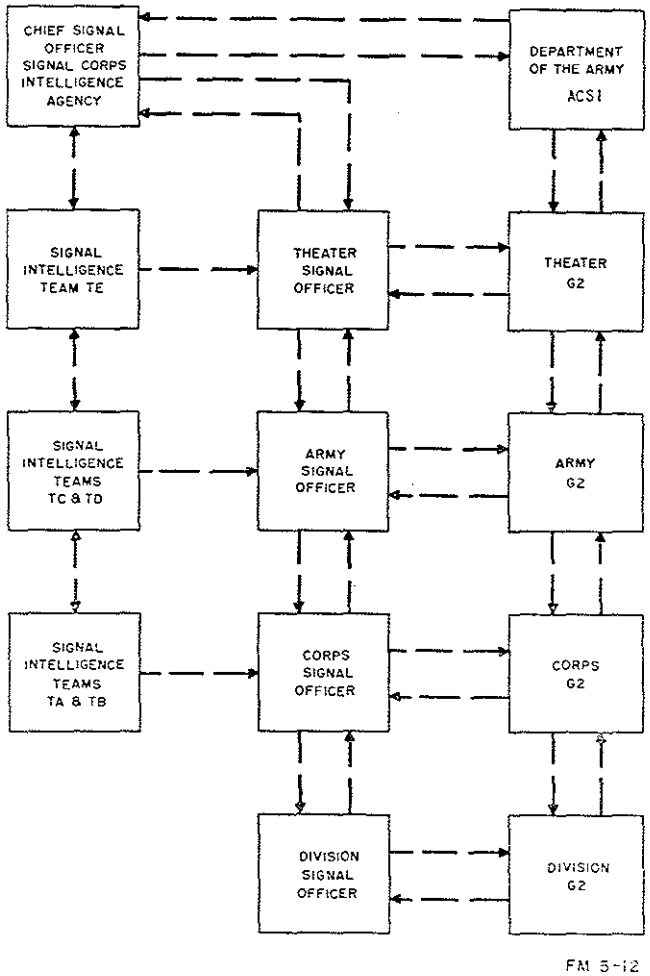

Figure 7. Dissemination of signal intelligence.

is conducted at theater level, where the TE team becomes the source of signal intelligence for all commanders within the theater. This effort is directed at all reports required to put the intelligence into the hands of the users. Normally, the periodic intelligence reports compiled and processed by the TE team are the means of dissemination. These reports are distributed to all interested commands through the theater signal officer. Information copies of all intelligence summaries, reports, and estimates are also disseminated by the theater signal intelligence officer to other signal intelligence teams as required.

58. Army

Dissemination of signal intelligence at army level is normally confined to equipment evaluation and periodic reports. These reports are distributed to—

a. Army signal officer.
b. Army G2.
c. Theater TE team.
d. Other interested commands (through the army signal officer).

59. Corps

At corps level, dissemination of signal intelligence is in the form of spot and periodic reports that have been prepared on collected items of information or equipment and that summarize signal intelligence over a given period. These reports are distributed to—

a. Corps signal officer.
b. Corps G2.
c. Army TC team.
d. Other interested commands (through corps signal officer.)

Section VII. SIGNAL INTELLIGENCE REPORTS

60. Introduction

All signal intelligence teams prepare reports. These reports are submitted to the appropriate staff signal officer and the unit G2. In turn, the signal officer transmits these reports—through technical channels—to the signal officer of his superior headquarters. Reports of interest to other commands are similarly transmitted to the appropriate signal or communications officer. Samples of various reports are given in appendixes II through V.

61. Coordination

a. To carry out their missions, signal intelligence teams must obtain much of their information and virtually all of their logistical support from units and agencies of the headquarters to which they are attached or from units subordinate to that headquarters.

b. To insure full cooperation and to maintain a good working relationship between the signal intelligence teams and their supporting agencies, the plans and operations of the teams must be coordinated at the headquarters to which they are attached. Most of this staff coordination can be arranged with G2 through the signal officer.

c. Other staff sections are often concerned with signal intelligence team activities, and they must be kept informed. For this reason, the distribution or routing of information copies of reports should be frequently reviewed.

62. Types of Reports

Special and periodic reports are prepared by the various units and agencies concerned with signal intelligence. These reports are disseminated in accordance with G2 policy.

a. Special reports are prepared whenever a useful item of information becomes available. Several different types of special reports are prepared by the different echelons of signal intelligence.

b. Periodic reports are prepared at specific intervals to keep interested echelons and agencies currently informed of the overall intelligence effort. They are prepared by signal intelligence teams at all echelons.

c. Specific types of reports are listed in the following table. This table also shows who prepares each type of report, to whom the report is normally distributed, and the general content of each type of report.

Type and designation	Prepared by—	Directed to—	General content
Spot (special).	Teams TA and TB	Corps SigO Team TC Corps G2	On-the-spot report. Brief information about newly collected materiel.
Equipment evaluation (special).	Team TD	Army SigO Teams TC and TE Army G2	Detailed description of capabilities of captured fixed plant installations, civil and military, and other special items of equipment.
Preliminary (special).	Teams TE and TD	SCIA Theater SigO Theater G2	Detailed report on selected items.

Type and designation	Prepared by—	Directed to—	General content
Periodic	All teams at periodic intervals	As required to higher, lower, and adjacent units and headquarters	Basic signal intelligence report. Summarization of collected materiel. All new signal intelligence items.
Technical bulletins.	SCIA	All interested headquarters	Detailed reports on selected items of equipment.
Other studies, summaries, and estimates.	All teams and SCIA	As required	As required

63. Requirements

Four principal characteristics of reports are brevity, clarity, pertinence, and interest.

a. Intelligence reports should be brief but complete. Thus, two conflicting aims must be satisfied.

(1) Brevity is needed for the commanders, staff officers, and others who require a brief summary of the enemy's operations and the significance of these operations in relation to probable future courses of enemy action.

(2) Detail is required by many other recipients, who must have the most complete information concerning specific aspects of enemy activity.

b. Clarity may be increased by stating known intelligence and admitting the lack of other desired information. Unconfirmed information must be so labeled. Unless this is done, units using the information as a basis for plans may become victims of false indications of the enemy's capabilities.

c. All intelligence reports must be both relevant and timely. The scope of enemy activity included in these reports varies with each headquarters for which the report is prepared. A small tactical unit usually requires information in considerable detail about the enemy. A higher headquarters is more concerned with information more appropriate to its operational requirements.

d. Illustrative material—such as photographs, maps, and sketches—add to the value and interest of a report. Readability can be maintained by elimination of unfamiliar abbreviations and unnecessary references. Excessive use of coordinates should be avoided, especially when a map is not included in the report.

CHAPTER 5
TRAINING

64. General

Signal intelligence training follows the methods of instruction prescribed by FM 21–5 and FM 21–6. The principles of *preparation, explanation, demonstration, application, examination,* and *discussion* can be followed throughout all phases of intelligence training. This training is best accomplished by centralized instruction, therefore every effort should be made to include pertinent aspects of signal intelligence in the course of instruction at all schools.

65. Scope of Training

a. Military intelligence training is a staff responsibility of the Intelligence Officer in coordination with the Operations Officer at each Command Level and is conducted in accordance with DA directives and training programs. This training is received by all members of the army during their basic and specialist training.

b. Basic signal intelligence training is given to all members of the Signal Corps and communications personnel of other arms and services. It covers—

(1) Responsibility of the Signal Corps for technical intelligence.
(2) Sources and methods of collecting and reporting signal information.
(3) The importance of preservation of captured communication equipment and material for examination.

c. Specialized individual intelligence training is given to officer and enlisted personnel selected for duty with a Signal Corps intelligence unit or agency. It may be given through special intelligence courses, through field training with a signal intelligence team, or through an assignment with the SCIA. Normally, this training includes—

(1) Principles of intelligence.
(2) Organization and mission of the signal intelligence teams and the SCIA.
(3) Value of signal intelligence.
(4) Composition of signal intelligence reports covering the tactical and strategic aspects of communication.
(5) Means of communication and a study of recognition factors of communication equipment.
(6) Organization of corps, army, and theater headquarters and of signal units operating in a theater of operations.
(7) Sources, collection, processing, and dissemination of signal intelligence information.
(8) Basic photography.
(9) Orientation in the language of the area of operation.

d. Specialized unit signal intelligence training begins on completion of individual training. Signal intelligence personnel are assigned to teams and the unit training begins. The officers assigned to the individual units are responsible for this phase of training.

(1) Usually, several teams are activated and trained as a complete unit in anticipation of assignment to a specific theater of operation. However, teams may be activated and trained individually.

(2) The training program for signal intelligence teams is based on an 8-week cycle. It is, essentially, an extension of the specialized individual program and a specialized course in each of the subjects listed under *c* above—covering each subject as it applies to the specific mission.

66. Responsibility

a. The *unit commander* must insure that all officers and enlisted personnel have an understanding of their intelligence duties.

b. The *signal intelligence officer* must correct deficiencies and increase the intelligence consciousness of personnel in his area of operation. Each soldier is potentially an information collector who should be trained to report on such matters as the location of captured or abandoned communication equipment and installations; the enemy's signal operating procedures, efficiency, and morale; the techniques of construction of communication centers; and the use of visual and sound communication methods by the enemy. Intelligence consciousness instilled in these men increases the flow of captured signal equipment through intelligence channels and decreases souveniring and needless destruction of valuable equipment. Training does not end with the completion of a program or school. It must be continued on-the-job training to be effective.

APPENDIX II
SPOT REPORT

1. Preparation

After selecting and tagging an item of signal equipment, an on-the-spot report is prepared by a member of the collection team.

a. The report should be concise and complete and should incorporate the following information:

(1) Item.
(2) Description.
(3) Condition.
(4) How and where obtained.
(5) Disposition.
(6) Remarks.

b. At the corps signal section, team TA consolidates and reproduces spot reports in sufficient quantities for dissemination. Reports normally contain information as indicated in *a* above, but may be supplemented as circumstances permit or require.

2. Example of Spot Report

CLASSIFICATION

Spot Report No. 15

2 October 1952

1. ITEM: Field switchboard.

2. DESCRIPTION:

a. General. Ten drop field switchboard, encased in a gray metal case about 17" x 8" x 6".

b. Weight. Approximately 15 lb with batteries.

c. Nomenclature. Type K–10, serial No. 4509751.

3. CONDITION: Generally good—two broken line terminals.

4. HOW OBTAINED: This item was captured by unknown elements of the ROK infantry when they routed an enemy company near Taegu on 9 October 1950.

5. DISPOSITION: This item has been evacuated to army.

6. REMARKS: This appears to be a new type switchboard, used by forward combat elements down to and including company. Photographs are attached.

APPENDIX III
EQUIPMENT EVALUATION REPORT

1. Content

After discovery or capture of an enemy military or civilian communication installation, the army signal officer requires knowledge of its condition and capabilities for possible use or integration into the communication system. This will require a thorough inspection and evaluation by the equipment evaluation team TD. This evaluation and inspection can also be made on special items of equipment collected by intelligence teams for purposes of furnishing such information to interested agencies at army. The resultant report is prepared by team TD after analysis. The report should disclose:

a. Name of installation.

b. Location (town, street, number, etc.).

c. Type (radio station, telephone central, etc.).

d. Circumstances of discovery or capture.

e. Complete description.

f. Recommendations for use or disposition.

g. Photographs, charts, diagrams, and sketches of the installation.

2. Example of Equipment Evaluation Report

CLASSIFICATION

HEADQUARTERS
174th Signal Intelligence Team
APO 112

2 Oct 1952

SUBJECT: Evaluation Report of Captured Radio Station
TO: See Distribution.

1. On 1 October 1952, elements of the 3rd Infantry Battalion, advancing through Genco, captured (almost intact) a radio station on the outskirts of the city.

2. The station, located on the top floor of an office building at No. 399 Darec Street, in the south end of Genco, was apparently used as a police or security force station. This station probably served to dispatch various radio-equipped elements and also operated in a net with a higher headquarters, probably located in Hostilia, about 250 miles to the southeast. Sufficient equipment was found to operate effectively in two separate nets within a 25-mile radius, and also to maintain point-to-point communications with a distant station, possibly in the city of Amigia.

3. This station is a semipermanent installation in fairly good condition, although tubes are smashed and interconnecting cables are cut. At present, the station is inoperative, but it could be rehabilitated with several days' work, since the tubes can be replaced with standard Signal Corps types. Following is a list of the major components of the station:

a. Three (3) Radio Transmitters, Type S–28–A.
Serial No. 487168–P, 487178–P, and 487034–P.
2.5 to 17.5 megacycle, voice and cw, 50-watt output.
Power: 220-volt, 1-phase, 60-cycle.

b. One (1) Radio Transmitter, Type S–11–F.
Serial No. 4916–A.
1.75 to 15.5 megacycles, voice and cw, 500-watt output.
Power: 220-volt, 3-phase, 60-cycle.

CLASSIFICATION

CLASSIFICATION

c. Four (4) Radio Receivers, Type R–33–C.
Serial No. 7465, 9382, 8675, and 8576.
.5 to 20 megacycles, voice and cw receivers.
Power: 110-volt, 1-phase, 60-cycle.

d. One (1) Frequency Meter, Type C–05–L.
Serial No. 95843–L.
.5 to 20 megacycle heterodyne frequency meter.
Power: 110-volt, 1-phase, 60-cycle.

e. One (1) Control Panel, Type B–17–D.
Serial No. 5011–P.
(This panel permits one operator to modulate or key any one of four transmitters at will, or to connect any transmitter to remote control lines as desired.)

f. Two (2) Generator Sets, Type P–155–B.
Serial No. 9382–F and 9383–F.
Diesel engine driven, skid mounted.
Output: 220-volt, 3-phase, 25-kva, 60-cycle.

g. Three (3) Antennas, Type R–78–X.
No serial numbers.
Vertical whip 22 feet long.
72-ohm coaxial cable to transmitters S–28–A.

h. One (1) Antenna, no type number.
No serial number.
Horizontal doublet 100 feet long on 60-foot poles running NE to SW.
600-ohm two-wire transmission line to transmitter type S–11–F.

i. Miscellaneous maintenance equipment and supplies.

4. Because of its nature, this station with its existing facilities would be well suited for use by the Military Police in traffic control. The equipment cannot be used with standard Signal Corps frequency-modulated vhf tactical radios. The high-powered transmitter could be removed and, with slight modification, could be used with frequency shift radioteletype keying. It is recommended that the power equipment be left

CLASSIFICATION

in place, because the 220-volt, 3-phase power required for the large transmitter is available at most fixed transmitter stations.

5. Arrangements have been made with the 14th Military Police Company to place a guard on the installation until disposition is confirmed.

6. Attached as inclosures are sketches of antenna systems and layout of equipment in the building. Photographs of major equipment items are also included.

/s/ E. X. James
E. X. JAMES
Major, Signal Corps

APPENDIX IV
PRELIMINARY REPORT

1. General

The preliminary report on captured equipment is made on selected items of equipment at theater level. Its primary purpose is to disseminate information on new or unusual items of equipment or material to interested agencies in the theater and to the SCIA in CONUS.

2. Content

The preliminary report should include:

a. Brief description.

b. How obtained.

c. Documentary material, if any.

d. Brief technical characteristics of the item and component parts.

e. Usage—normal and special.

f. Comparison with United States materiel and possible use by United States forces.

g. Recommendation and disposition.

h. Other information as may be required by the theater commander.

3. Example of Preliminary Report

CLASSIFICATION

HEADQUARTERS
APO 111
175th Signal Intelligence Team

20 October 1952

SUBJECT: Preliminary Report on Captured Field Radio Type RBM-1.

TO: See Distribution

1. One complete unit of this field radio, type RBM-1, was captured by unknown elements of the ROK infantry about 1 October 1952, in the vicinity of SEISNU (42.7-05.3).

a. The equipment is divided into four sections for pack transportation; two sections are in metal cases and two sections are in canvas bags. When transported by truck, the equipment is packed into one wooden chest. The basic transmitter-receiver section is housed in a metal case which measures 13 x 7 x 10½ inches and weighs about 25 pounds. The battery case, type UP, is similar to the transmitter-receiver unit. The normal battery complement used with Radio Set RBM-1 consists of one storage battery, type 2NKN-22, and four dry battery units, type BAS-60, or three dry battery units, type BAS-80. The battery case, complete with batteries, weighs about 27 pounds. A canvas bag contains the headset, handset, telegraph key, and connecting cables. The antenna kit is packed in a second canvas bag. In addition, there are two small, wooden boxes for spare parts.

b. No documentary material relating to this unit was captured with this set.

2. This radio set is a complete transmitter-receiver on one chassis covering the frequency range of 1.5 to 5.0 megacycles, and it is battery operated. Receiver and transmitter dials are identical. In each case, only the scale corresponding to the band in use is exposed. Band ranges are: BAND I, from 1.5 to 3.0 megacycles; and BAND II, from 3.0 to 5.0 megacycles. Separate band switches are provided for the transmitter and receiver. All operating controls are located on the front panel.

CLASSIFICATION

CLASSIFICATION

a. Three type SO-257 tubes are used in the transmitter. Power output is about .5 watt on radiotelegraph and .3 watt on radiotelephone.

b. The receiver employs a type SB-242 tube as the mixer-oscillator and five type 2K2M tubes in the remainder of the receiver. Audio power output of the receiver averages .03 watts. Telephone line connections are provided so that the radio set may be used from a distant point if an operator is present to control the send-receive switch.

c. Both transmitter and receiver use a battery power supply that is carried in the case marked UP. A terminal strip is provided at one end of the case for connecting batteries to the jack serving the power cord from the radio set. An additional two-contact jack is provided on the outside of the case, supplying 2 volts.

d. The antenna is a rod-type screwed into the antenna socket on the panel, and consists of six 1-foot sections and a top section of five flat metal fingers, about 9½ inches long, fanned out to form a star.

e. No test equipment was captured with this set.

3. At the time of capture, the set was in use at a command post; however, it appears that it can also be used from a vehicle or on the march. If captured in quantity, it could be used by United States forces, netting with the SCR-694 and the SCR-536. It appears to be rugged and simple in design as compared with the United States sets.

4. Photographs accompanying this report indicate details of serial numbers, nomenclature, etc. Recommend that the unit be air-shipped to the CONUS at an early date for further examination and analysis.

F. J. HILL
Captain, Signal Corps

CLASSIFICATION

APPENDIX V
PERIODIC REPORT

1. General

The periodic report is the basic and primary means of disseminating signal intelligence. Used at all levels, it sums up the information that has been collected, evaluated, and interpreted during a given period. It is a convenient means of keeping higher, lower, and adjacent units informed of the enemy situation. It frequently contains important information that has been disseminated by means of special messages and reports. Distribution of periodic intelligence reports usually is made to staff sections of the unit headquarters, headquarters of the next two higher and subordinate echelons, and adjacent units. Further dissemination may be made as required and in accordance with G2 policy.

2. Content

No standard content for this report can be formulated. The content, format, and preparation depend on the procedures of the headquarters to which the team is assigned and upon the type and amount of intelligence available at the time of preparation. However, the periodic report should include:

a. Summaries of all items of signal equipment and information collected—quantity, condition, and disposition.

b. Summaries of all signal intelligence items collected during the period covered by the report—intelligence concerning enemy signal operations, usage of equipment, type of communications, nets, quality, and morale of enemy signal personnel.

c. Comments by the signal intelligence officer interpreting new intelligence, and old intelligence in light of new information.

d. Other information as required by the commander of the headquarters to which the team is attached.

3. Example of Periodic Report

CLASSIFICATION

HEADQUARTERS
175th Signal Intelligence Team
APO 111

20 October 1952

SUBJECT: Periodic Report No. 10, Period 1 Oct 52 to 15 Oct 52.

TO: See Distribution

1. During the period covered by this report, the following items of signal equipment and materiel have been collected by Signal Intelligence Collection Teams. Samples of all items have been evacuated for further inspection and analysis.

Item	*Quantity*	*Location or disposition*
1. Field Switchboard Type RBM–1–K	9 complete	Evacuated to CONUS 10 Oct 52
2. Field Radio Set Type K–42T5	15 less power supply	Stored at 147 Signal Depot
3. Field Telephone Type RBL–17	22 new, in original containers.	Stored at 147 Signal Depot
4. Field Telephone Type RBL–105	1	Evacuated to CONUS 2 Oct 52
5. Field Wire Type TLB	Twenty ½-mile reels	Stored at 147 Signal Depot
6. Radio Receiver Type PCR	2	Evacuated to CONUS 2 Oct 52
7. Batteries Type T3B4	500 (2½-volt, original containers).	Stored at 147 Signal Depot

2. As evidenced by numerous reports from varied sources, the previous high quality of enemy signal communications has deteriorated to some extent. This appears to be especially true on the central front. There appears to be a shortage of fully trained operators, primarily radio. In general, along all fronts, the morale of enemy signal personnel is low.

CLASSIFICATION

CLASSIFICATION

a. Extensive interrogation of enemy radio operators, captured in a recent probing attack on the central front, reveals that the enemy is now using partially trained personnel to make up losses suffered in recent reversals.

b. Reports of POW's in subparagraph *a* above have been confirmed by interrogation of another prisoner of war, who was captured in action on the eastern front. This POW confirmed that the enemy is generally in short supply of critical signal items, which has caused communication personnel to complain and take a defeatist attitude.

c. Preliminary analysis of Field Telephone RBL–102 Type, captured in September 1952, reveals that improved equipment may soon be used in greater quantities by combat elements. The RBL–102 type telephone has an increased audio range of up to 5 miles over previous models; it is sturdier, more compact, and lighter than telephones in use. Similar trends toward smaller, compact units have been noted in other items of captured equipment.

d. A POW recently interrogated by G2 asserted that future attacks will be preceded by absolute radio silence, followed by a sudden increase in sound and visual signals, including pyrotechnics, in the forward areas. These signals will be used to transmit prearranged messages between commanders of forward elements. Armored vehicles will use pyrotechnic signals up to and into the initial stage of attack. This information was confirmed by a document from another source. This ties in with recent information that pyrotechnics are being brought up to forward areas in greater quantities.

Comment: Although enemy signal communications seem to have deteriorated somewhat, it is believed that this is a temporary condition due to recent intensified air strikes against the enemy's lines of communication. For planning purposes, it is felt that the capability of the enemy communications to support a major offensive has been somewhat neutralized, but is still stable.

TECHNICAL INTELLIGENCE PLAN
(ALL ECHELONS)

CLASSIFICATION

Issuing Headquarters
Place
Time/Date

Appendix.....to Annex.....(Intelligence) to Opn Plan.....

1. General

A statement of the purpose, references, period covered, and designation of subordinate elements required to prepare similar plans.

2. Organization

A statement of the mission, organization, allotment of Signal Corps technical intelligence detachments, responsibilities and functions, as well as designation of Signal Corps Depots.

3. Personnel

a. Military. Policy concerning: special passes; taking custody of captured enemy materiel; movements in forward areas; reporting to command posts; cooperation with combat intelligence personnel; relationship between intelligence and Signal Corps technical intelligence personnel.

b. Civilian.

(1) Authority for presence in theater of operations; passes required.

(2) Policies concerning sponsors for individuals and groups.

(3) Responsibility of sponsor for logistical support.

CLASSIFICATION

(4) Limitations on activities of individuals and groups.

4. Direction

Policies governing publishing requirements and Items Wanted Lists; designation of special targets; direction to be provided by subordinate echelons and technical services.

5. Collection

a. Documents. Procedures for collecting and forwarding documents; responsibilities for evaluating importance and timeliness of data; channels for forwarding.

b. Prisoners. Procedures for selection and interrogation of personnel with technical knowledge; channels for evacuation; ultimate disposition (civilians, neutrals, deserters, etc.).

c. Materiel.

(1) Disposition of information concerning captured enemy materiel.

(2) Policies for safeguarding, evacuation, examination and ultimate disposition.

d. Facilities. Procedures for collecting and reporting information, responsibility and preparing EEI; channels for forwarding or disposition of facilities data.

6. Processing

a. Records required to be maintained.

b. Policies governing preparation of preliminary and final field reports.

c. Liaison and coordination between intelligence agencies and Signal Corps concerning evaluation and interpretation of technical intelligence information.

7. Dissemination

a. Purpose, scope, language, content, and type of periodic and special reports to be submitted.

b. Policies governing dissemination.

8. Scientific/Technical Intelligence Task Force Operations

a. Theater and theater army policy concerning scope and effort that may be expended on missions.

b. Authority to determine whether an intelligence target should be saved for capture or destroyed.

c. Procedures for collecting and reporting data.

d. Responsibility for direction of operations.

e. Limitation on units and individuals authorized to participate.

f. General provisions for security of planned operations; safeguarding components of intelligence and other value; priorities concerning exploitation.

FIELD MANUAL

SIGNAL CORPS TECHNICAL INTELLIGENCE

FM 11–30
CHANGES No. 1

HEADQUARTERS,
DEPARTMENT OF THE ARMY
WASHINGTON 25, D.C., *1 November 1961*

FM 11–30, 13 August 1956, is changed as follows:

Wherever "Signal Corps Intelligence Agency" or its abbreviation "SCIA" appears, change to United States Army Signal Intelligence Agency and USASIA respectively.

4. Definitions

Signal intelligence as defined in **AR 320–5** is to be sharply distinguished from communication intelligence, and electronic intelligence.

* * * * *

b. Communication intelligence consists * * * of this manual. **It is a function for which the Signal Corps has partial responsibility in certain areas of intelligence.**

* * * * *

15. General

The **USASIA** is a class II activity under the control of the Chief Signal Officer through the **Research and Development Division** of the OCSigO. The **USASIA:**

* * * * *

16. Operations

The **USASIA:**

* * * * *

i. (Superseded) Disseminates completed intelligence to agencies under control of the Chief Signal Officer, and to the ACSI.

20. Theater Headquarters

The TE-type team * * * (fig. 2). This team—

* * * * *

c. Supervises the storage, issue, and shipment to CONUS of collected **signal** material.

33. Fields of Interest

Signal intelligence is concerned with information pertaining to—

* * * * *

Infrared devices. (Added)

Space vehicle communications equpipment. (Added)

Automatic data processing equipment. (Added)

34. Targets

Any nation normally * * * the following locations:

* * * * *

b. Strategic.

* * * * *

(14) (Added) Television stations.

40. Checklist for Collecting Military Communication Information

a. Organization and Equipment of Enemy Units.

* * * * *

(6) (Added) Name of Signal Officer.

* * * * *

h. Other Equipment. Any other equipment used or controlled by the Signal Corps—such as visual, sonic, infrared, **television,** and flash ranging equipment.

41. Checklist for Collecting Information on Nonmilitary Civilian Communication Facilities

* * * * *

b. Radio ***and television*** *facilities* (*including broadcasting stations*).

* * * * *

c. (Added) *Communications-Electronics Manufacturing Plants.*

(1) Name and location.

(2) Type equipment produced.

(3) Current operational condition.

(4) Inventory of completed equipment, parts, and raw materials.

d. (Added) *Communications-Electronics Research and Development Laboratories.*

(1) Name and location.

(2) Type of equipment under development.

e. (Added) *Photographs and Documents Pertaining to Communications-Electronics Facilities, Manufacturing Plants and Research Laboratories.*

44. Signal Equipment Control

Captured signal equipment * * * of souvenir hunters.

* * * * *

c. Communication centers, facilities, supply depots, technical installations, **research and development laboratories and manufacturing plants,** or an intelligence task force warrant particular precau-

tions and provisions to prevent unintentional destruction by combat troops, delayed enemy demolition, looting, or removal by souvenir hunters.

65. Scope of Training

* * * * *

d. (Superseded) *Specialized unit signal intelligence training* begins on completion of individual training. The officers assigned to the individual units are responsible for this phase of training.

(1) Normally, personnel selected for assignment to a signal intelligence unit will be assigned initially to a lower echelon team—Team TA for administrative personnel, and Team TB for Signal Corps technicians. As training and experience are gained, qualified personnel will be selected for subsequent assignment to a higher echelon team—Team TC, TD, or TE—to meet normal replacement requirements in appropriate military occupational specialties.

(2) When required, several teams may be activated and trained as a complete unit for assignment to a specific theater of operations. However, teams may be activated and trained individually. Individual replacements normally can be integrated into a team and receive on-the-job training on an individual basis with no loss to unit effectiveness.

(3) For newly activated teams the training program is based on an 8-week cycle. It may also be desirable to retrain teams under this program, when warranted by a large turnover of personnel. The program is, essentially, an extension of the specialized course in each of the subjects listed under *c*, above—covering each subject as it applies to the specific mission.

APPENDIX II (Superseded)

SPOT REPORT

1. Preparation

After selecting, photographing, and tagging an item of signal equipment, an on-the-spot report is prepared by a member of the collection team.

a. The report should incorporate the following information:

(1) Nomenclature of item.
(2) Description.
(3) Condition.
(4) How and where obtained.
(5) Cross-reference to photographs, if any.
(6) Disposition.
(7) Remarks.

b. Since the lower echelon collection team has limited administrative capability, forms may be reproduced and kept on hand so that the report can be expeditiously completed in pencil. Reports normally contain information as indicated in *a*, above, but may be supplemented as circumstances permit or require. An example of a spot report is shown in paragraph 2.

c. At the corps signal section, team TA screens and forwards the reports with recommendations to the corps signal officer as to distribution of information which has not been previously reported.

d. At each successive echelon in signal intelligence channels, the responsible team or agency will screen the reports and forward to the next higher echelon those which contain newly acquired information.

2. Example of Spot Report

CLASSIFICATION

SPOT REPORT NO. 15 DATE: 2 Oct 52

1. ITEM NOMENCLATURE:
Field Switchboard, K–10.

2. DESCRIPTION:
Ten drop switchboard in a gray metal case. 17″ x 8″ x 6″. Weight: 15 lbs w/batteries. Ser. Nr. 45Ø9751.

3. CONDITION:
Good ~~Fair~~ ~~Poor~~

4. HOW AND WHERE OBTAINED:
2d ROK Inf. Regt; 3 miles NW of TAEGU.

5. PHOTOGRAPHER:
Pfc Spencer
Pack Nr. 4 Exp. Nr. 6

6. DISPOSITION:
Evacuated to Army.

7. REMARKS:
Captured from company level unit. Appears to be new type switchboard for forward combat units down to and including company.

PREFACE

This field manual provides guidance to commanders and staffs of military intelligence (MI) and other units responsible for technical intelligence (TECHINT) or having an association with TECHINT. It provides general guidance and identifies the tactics, techniques, and procedures (TTP) used in the collection, exploitation, and dissemination of TECHINT in satisfying the warfighter's requirements.

TECHINT is an integral part of the overall battlefield operating system (BOS) and supports Army operations through the analysis and exploitation of foreign equipment, weapons, and other war materiel.

This field manual describes the TECHINT process at all echelons and identifies responsibilities. It further describes the MI TECHINT organizations, other services, and the strategic level intelligence agencies supporting the process.

On today's battlefield, Army forces will likely deploy as part of a joint or combined military operation. For that reason, while this manual supports Army operations, it does so in the context of Army operations as part of a joint or combined task force.

This field manual applies to all Army personnel, to include Active Component (AC) and Reserve Components (RC) commanders and their staffs, US Army Training and Doctrine Command (TRADOC) Centers and Schools, and MI elements.

The proponent of this publication is US Army Intelligence Center and Fort Huachuca (USAIC&FH). Send comments and recommendations on DA Form 2028 (Recommended Changes to Publications and Blank Forms) directly to Commander, US Army Intelligence Center and School, ATTN: ATZS-TDL-D, Fort Huachuca, AZ 85613-6000.

The doctrine in this publication conforms with and supports the principles in FM 34-1 and FM 100-5. This manual does not implement any international standardization agreements but complies with the following Standardization Agreements:

STANAG 1059 - National Distinguishing Letters for Use by NATO Forces (Edition 6).
STANAG 2014 - Operations Plans, Warning Orders, and Administrative/Logistics Orders (Edition 7).
STANAG 2044 - Procedures for Dealing With Prisoners of War (Edition 5).
STANAG 2084 - Handling and Reporting of Captured Enemy Equipment and Documents (Edition 5).
STANAG 2097 - Nomenclature and Classification of Equipment (Edition 6).
STANAG 2143 - Explosive Ordnance Reconnaissance/Explosive Ordnance Disposal (Edition 4).
STANAG 2389 - Minimum Standards of Proficiency for Trained Explosive Ordnance Disposal Personnel (Edition 1).
STANAG 2834 - The Operation of the Explosive Ordnance Disposal Technical Information Center (EODTIC) (Edition 2).

Unless this publication states otherwise, masculine nouns and pronouns do not refer

exclusively to men. The use or mention of any commercial or private organization's name or trademark and the organization's services and/or funds by the US Army does not express or imply an endorsement of the sponsor or its products and services by the US Army.

Chapter 1

TECHNICAL INTELLIGENCE MISSION AND SUPPORT

GENERAL

This chapter describes the TECHINT mission, how it supports the warfighter, and presents TECHINT in a historical perspective. TECHINT results from the collection, evaluation, and analysis of foreign warfighting equipment and associated materiel. At the strategic level, the exploitation and interpretation of foreign weapons systems, materiel, and technologies is referred to as scientific and technical intelligence (S&TI). This S&TI covers—

- Foreign developments in basic and applied research and in applied engineering techniques.
- Scientific and technical (S&T) characteristics, capabilities, and limitations of all foreign military systems, weapons, weapon systems, and material.
- Research and development (R&D) related to these systems and the production methods employed for their manufacture.

MISSION

The TECHINT mission ensures that the warfighter has a clear understanding of the full technological capabilities residing in his opponent's equipment. With this knowledge, the warfighter adopts countermeasures, operations, and tactics, as necessary, to be successful in any assigned mission.

TECHINT SUPPORT TO THE WARFIGHTER

STRATEGIC LEVEL:

The US has relied on its military strength as a strategic deterrent to war. The strength of the US military lies, in part, to the diversity and extent of its technology base. While the US aspires to be the leader in integrating technology, the actual products are available to any buyer. An adversary can achieve temporary technological parity or advantage by acquiring modern systems or capabilities. The world arms market is willing to provide these advanced systems to countries or individuals with the resources to

pay for them. A concerted TECHINT program is vital to providing precise direction and purpose within the US R&D process to ensure that this parity or advantage is neutralized quickly and efficiently.

OPERATIONAL AND TACTICAL LEVEL:

For the Army, technology is changing how we organize, how we train and develop leaders, and how we conduct operations. Advances in electronics, communications, automation, reconnaissance and surveillance (R&S), contamination avoidance, precision-guided munitions, and the exploitation of space-based capabilities have increased the lethality, range, accuracy, and reliability of our weaponry.

Operational and tactical commanders rely on this technological advantage to successfully synchronize and execute complex modern Army operations. The introduction of a surprise technological capability by an adversary causes confusion and delay mission accomplishment until the capability is understood and countered. TECHINT is the key to the early identification of an adversary's technical capabilities and the development of countermeasures for the operational and tactical commander.

HISTORICAL PERSPECTIVE

In the 1920's, Germany was developing the weapons and systems it would use against the Allies in the 1940's. Because Allied nations did not integrate TECHINT into peacetime collection efforts, German S&T advances went largely unnoticed. When information did come to light, Washington and London ignored or ridiculed it. Later, when the Germans fielded their advanced weapons and systems in war, the resulting technological surprise on the battlefield was devastating.

WORLD WAR II:

During the air battle for Europe, the British used TECHINT to counter the German antiaircraft and night-fighter defenses. This was accomplished by exploiting captured aircraft radios and a captured radar station. (See below a discussion of the Bruneval Raid.)

The Allies captured many German and Italian weapons in North Africa. This collection led to the publishing of new technical material, such as—

- Technical manual E9 series handbooks on enemy weapons.
- Special series publications on German weapons.
- Training aids.

- Updates to handbooks on the German and Italian armies.

TECHINT exploitation of captured German Tiger and Panther tanks led to several important battlefield countermeasures. One of these was the adoption of new armor tactics while another was the development of more powerful antitank rockets.

The United States started a successful TECHINT program in the fall of 1943 called the ALSOS mission. This unit was made up of Counterintelligence (CI) Corps agents, scientists, and interpreters. Their mission was to capture and exploit personnel and material of S&T value.

The successes of this unit included:

- Exploitation of Italian and German nuclear scientists.
- Removal of significant quantities of uranium ore from the Albert Canal.
- Recovery of the international radium standards from what was to be the Soviet occupied sector of Germany.

Throughout the remainder of the 1940's a Foreign Materiel Intelligence Branch at the Ordnance Center, Aberdeen Proving Grounds, MD, continued to conduct exploitation work on captured German and Japanese equipment.

THE RAID ON BRUNEVAL—AN OFFENSIVE TECHINT OPERATION:

At 2100Z on 27 February 1942, 119 British soldiers of Company C, 2nd Battalion, the Parachute Regiment, parachuted into a drop zone near the small village of Bruneval, in Occupied France. The company's mission was to raid a suspected German radar site on a cliff a few hundred yards from an accessible beach to bring back an item of extreme TECHINT interest—the WUERZBURG radar.

The WUERZBURG radar was believed to be a mobile, short-range, high-precision radar responsible for the sudden and serious increase in Allied heavy bomber losses. Routine Allied photographic reconnaissance originally discovered the installation in January 1942. French resistance forces were sent to investigate. They confirmed the site as well as a garrison troop strength of nearly 200 enemy signal, support, and security troops. They also reported that the nearby beach was not mined.

It was the intelligence and urgent need to protect Allied planes that resulted in the commando raid that night. Once on the ground, the commandos moved quickly and split into three equal groups. The first group secured

the beach. The second group spread out and took up positions to act as a reserve or blocking force. The last group, the collection team and a special radar technical expert, moved forward to take the target.

The collection team slipped through enemy defender positions, entered the installation, and found the radar. They used hacksaws, crowbars, and precision hand tools to dismantle the main components. As each part of the radar was exposed, it was sketched and photographed. The team also captured a German signalman—the radar operator.

When they finished, the team destroyed what they couldn't take with them and began their move to the beach under progressively heavy fire. The surviving commandos were picked up by Allied landing craft and escaped across the Channel to England.

Exactly three and one-half hours after the mission began it was over. Although two men were killed, six wounded, and six more listed as missing in action, the raid was deemed a great success. Not only was it the first raid on the continent following the disaster at Dunkirk but also it resulted in the successful capture of a valuable piece of enemy material—material that later proved to be of vital TECHINT interest.

Allied TECHINT experts examined the material as soon as they got it. The exploitation of this radar, along with the sketches and the photographs, quickly began to provide valuable TECHINT. For example, just from the recovered metal manufacturer's plates, analysts accurately determined how many Wuerzburg radars had been produced and their current rate of production. When the German signalman was interrogated, he provided valuable information about the level of operator skills and operator training. Most important, though, TECHINT scientists
used the captured material to build an operational Wuerzburg radar mockup.

When the mockup was completed, they had a multifrequency radar that seemed, at first, to be almost impossible to jam. Scientists went to work to develop countermeasures to neutralize the radar's capabilities. Their efforts resulted in thin metallic strips cut to different lengths that could be dropped from airplanes. These strips reflected radar signals and effectively jammed the new radars. They dubbed these strips *chaff*. CHAFF turned out to be one of the most successful countermeasures developed during World War II—being particularly useful during the Normandy Invasion.

THE KOREAN WAR:

It wasn't until the beginning of the Korean War, when North Korean troops in Soviet-designed and Chinese-built armor rolled south, that the United States discovered it had little confirmed data on enemy weapons systems.

We realized that to be able to develop effective countermeasures, TECHINT had to be an ongoing process. As a result, we once again began a concerted TECHINT effort, with the Foreign Material Intelligence Branch at Aberdeen Proving Grounds training and fielding TECHINT teams to Korea.

In the Korean War, the warfighters found that their 2.36-inch bazooka rockets could not penetrate the T-34/85 tanks' frontal armor. With this combat deficit identified, commanders began to support the TECHINT process by evacuating captured T-34/85 tanks and other material to TECHINT elements for exploitation. TECHINT both in the theater and back in the United States at the Chrysler Corporation analyzed the captured material. The US Army responded by giving combat commanders new tactics, a redesigned M-48 tank, and a 3.5-inch bazooka.

The TECHINT effort also supported the political effort to prove Soviet involvement on behalf of the North Korean aggressor. Captured modern Soviet weapons were regularly paraded before the UN Security Council as evidence of Soviet support.

THE VIETNAM WAR:

Following the Korean War, the United States did not disband its TECHINT capability completely, as had been done at the conclusion of all previous hostilities. But neither did we maintain it at its wartime level. Three small TECHINT detachments remained in place at the Army's research and development centers. By 1962 two of the detachments merged to form the Army's Foreign Science and Technology Center. The third detachment established the Missile Intelligence Agency at Redstone Arsenal. The Surgeon General also operated a Medical Intelligence Center at Fort Detrick, MD.

An agency called the Captured Materiel Exploitation Center (CMEC) came into being in 1966. Its wartime mission was to manage, coordinate, and analyze captured enemy equipment (CEE), and technical captured enemy documents (CEDs). The CMEC did this on a tactical level by dispatching teams of experts and analysts into the tactical zone of each corps. These teams analyzed captured materiel in the field and recommended countermeasures to tactical commanders. American personnel working in the CMEC were assigned to Delta Company, 519th MI Battalion.

The North Vietnamese employed Soviet designed man-portable systems with considerable success. The Soviet AT-3 Sagger antitank guided missile (ATGM) was used against South Vietnamese armored vehicles, communications bunkers, and even small outposts. In addition, the SA-7 heat-seeking surface-to-air missile (SAM) was employed and became an even more serious threat because it could disrupt allied control of the air

space over the battlefield. Lastly, the 122-mm rocket was employed as the North Vietnamese Army's (NVA) primary artillery weapon in a variety of configurations. While samples of these weapons undoubtedly fell into the hands of the South Vietnamese, nothing was done with them because of the September 1969 inactivation of American TECHINT units in Vietnam. And, by October 1971, the 55th Military Intelligence Detachment, a corps support unit with a TECHINT capability, had also been inactivated.

GRENADA (OPERATION URGENT FURY):

Following the commitment of US forces to Grenada on 25 October 1983, large quantities of foreign military equipment were discovered thus requiring TECHINT support.

Two elements of the 203d MI Battalion, 513th MI Group, were deployed to Grenada. Five soldiers participated as members of a Defense Intelligence Agency (DIA) Team formed at the request of the Commander in Chief, Atlantic (CINCLANT) operational commander for URGENT FURY. The first element arrived in Grenada on 31 October 1983 and was tasked to identify, sort, and provide approximate inventories of foreign material and to establish priorities for shipment to the United States. Nineteen other soldiers established the 203d MI Battalion (Forward) and operated a modified CMEC. Together the 203d soldiers type-classified and developed inventories; assisted combat units in searches for materiel; operated a collection point for CEE and captured enemy materiel (CEM); and shipped appropriate items to the continental United States (CONUS).

In 1985 the 203d MI Battalion was redesignated the Foreign Materiel Intelligence Group. In 1989 it was again redesignated as the Foreign Materiel Intelligence Battalion (FMIB).

THE GULF WAR (OPERATIONS DESERT SHIELD and DESERT STORM):

DESERT SHIELD and DESERT STORM were the largest battlefield TECHINT operations since the Vietnam War, and the largest joint and combined TECHINT operations since World War II. The Joint Captured Materiel Exploitation Center (JCMEC) was formed with the Army's FMIB to serve as the nucleus and headquarters. Augmentation to the FMIB included TECHINT personnel from every element of the Department of Defense (DOD), the national S&TI community, Great Britain, Canada, and Australia.

During Sadaam Hussein's attack on the Saudi Arabian city of Khafji in February 1991, a previously unseen and highly modified tank was captured. This tank, a modified T-55, had vastly improved external armor and possibly new fire control, weapons, and optical systems. A team from the JCMEC was dispatched forward to conduct a hasty exploitation and to

find out if this tank required a tactical capabilities reassessment. In layman's terms, could this new tank, with its improved armor, defeat a broader array of friendly weaponry? Within 2 days, the TECHINT collection team soldiers, analysts at the JCMEC, and national S&TI agencies in the United States were able to report their findings to the theater commander and his staff.

DESERT SHIELD and DESERT STORM produced the largest amount of CEM in the shortest amount of time since World War II. As a result of lessons learned from prior deployments, TECHINT provided unprecedented timely and accurate information to the warfighter and the national S&TI community.

SOMALIA (OPERATION RESTORE HOPE):

On 4 December 1992, the FMIB alerted a TECHINT liaison element (LNE) for deployment in support of the US Marine Corps (USMC) II Expeditionary Force, the core headquarters for Joint Task Force (JTF) Somalia.

The TECHINT LNE deployed to Somalia on 16 December and established operations at the US Embassy compound in southwest Mogadishu on 18 December. The TECHINT LNE made several significant contributions to the operations and intelligence efforts in Somalia.

On 21 December, the LNE accompanied a delegation from the JTF Somalia headquarters on a tour of compounds controlled by rival warlords in Mogadishu. During the 5 to 10 minutes the LNE was inside of each of the five compounds, the TECHINT LNE personnel compiled lists of the foreign and US weapons, equipment, and ordnance controlled by the warlords. This order of battle (OB) intelligence was key in planning the eventual US forces attack against one of those compounds.

After determining there was no theater-wide plan for the collection and processing of CEM, the TECHINT LNE established the Centralized Weapons Collection Center (CWCC). In conjunction with explosive ordnance disposal (EOD) personnel, the CWCC processed, screened for intelligence value, and disposed of thousands of captured weapons and hundreds of thousands of rounds of ammunition.

On 6 January, several SA-7 man-portable SAMs were captured in the Mogadishu area. In conjunction with EOD personnel, and with input from the US Missile and Space Intelligence Center (MSIC), the TECHINT LNE reported that the missiles were functional. This intelligence prompted a change in the air defense artillery (ADA) threat status and flight operations in Somalia.

On 14 January, several French MILAN antitank missiles were captured in

the Mogadishu area. The TECHINT LNE conducted testing and evaluation of captured missiles with personnel from the French contingent of Commander, Joint Task Force (CJTF) Somalia. The missiles were functional and capable of defeating all but the heaviest armor in the Somali theater of operations.

HAITI (OPERATIONS RESTORE DEMOCRACY and UPHOLD DEMOCRACY) :

In September 1994 FMIB deployed a 14-soldier TECHINT contingency support detachment (CSD) and a 2-soldier LNE in support of US Operation RESTORE DEMOCRACY. TECHINT LNE personnel, in conjunction with JTF 180 and JTF 190 planners, developed handling and processing procedures for CEM, including weapons received as part of the "Cash for Guns" program.

The CSD established the JCMEC (Forward) in Port-au-Prince. The CSD screened, processed, and inventoried over 10,000 weapons and thousands of rounds of ammunition by hand without the benefit of materiel-handling equipment. The resulting database provided OB analysts a tool for assessing the threat to US forces as well as the success of the "Cash for Guns" program. Additionally, the "by serial number" inventory was forwarded to national law enforcement agencies via CI liaison channels to aid in arms smuggling investigations.

At the time of redeployment, CSD personnel had accomplished all assigned national TECHINT collection requirements, and through intelligence discipline integration, played key roles in various signals intelligence (SIGINT) and human intelligence (HUMINT) operations.

LESSONS LEARNED

The historical experience of the nation in times of peace and war clearly demonstrates the need for a fully operational Army TECHINT capability. A robust TECHINT collection and analysis capability, with dynamic links to S&TI centers in the United States is especially vital in the future's technologically sophisticated battlefield. This capability is required to correctly portray the battlespace for warfighting commanders. Furthermore, TECHINT enhances force protection. To neglect TECHINT during the planning and execution of Army operations invites the possibility of technological surprise.

Chapter 2

SCIENTIFIC AND TECHNICAL INTELLIGENCE

INTRODUCTION

TECHINT is the end product of a complex process. It is the result of collecting, analyzing, and processing information on foreign technological developments. It is also the result of studying the performance of foreign materiel and its operational capabilities.

TECHINT has two goals:

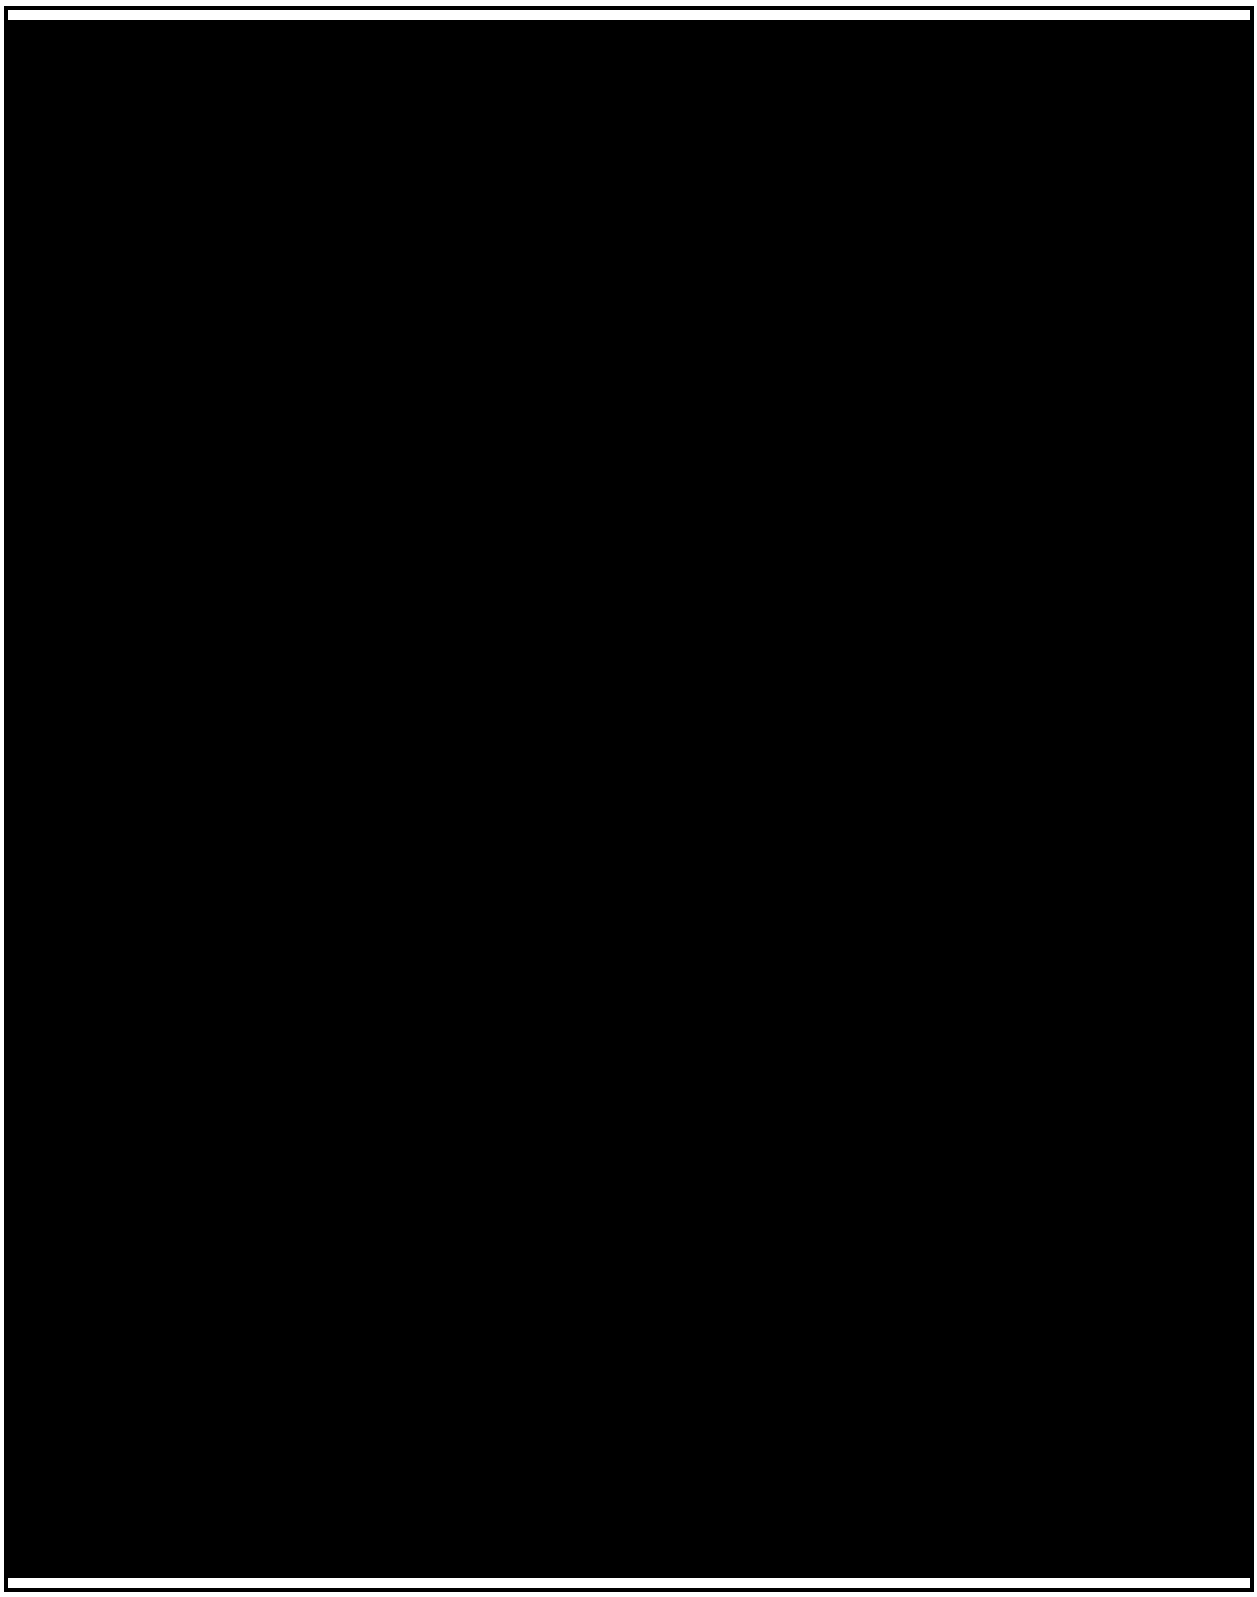
- To ensure the US armed forces maintain technological advantage against any adversary.
- To provide tailored, timely, and accurate TECHINT support to the warfighter throughout the entire range of military operations.

This support includes providing US forces information and training on foreign weapons systems to an extent that allows use of the CEE. The TECHINT system accomplishes both missions.

THE S&TI COMMUNITY

The S&TI community satisfies the nation's overall TECHINT objectives during peacetime, and the strategic TECHINT requirements in wartime. The S&TI community starts at the DOD level. Figure 2-1 shows this organizational structure.

S&TI is designed to track and analyze foreign technological developments. It is used to analyze the performance and operational capabilities of foreign materiel that may have military application.
Although the primary function of the S&TI community is to satisfy strategic TECHINT objectives, it also makes significant contributions toward fulfilling operational and tactical TECHINT requirements. Strategic communications between battlefield TECHINT units and S&TI centers allow the use of their comprehensive databases and expertise to rapidly satisfy the TECHINT requirements of the warfighter.



STRUCTURE

DEFENSE INTELLIGENCE AGENCY:

DIA manages and reviews overall TECHINT activities throughout DOD during peacetime and war. The S&TI directorate within DIA is the action element for TECHINT. This directorate coordinates with external TECHINT agencies on nonpolicy matters concerning the production of S&TI.

Armed Forces Medical Intelligence Center (AFMIC). AFMIC, based at Fort Detrick, MD, is a DOD intelligence production center under control of DIA. AFMIC is responsible for exploiting foreign medical materiel. The director supports the Army Foreign Materiel Exploitation Program (FMEP) and Army medical R&D requirements. The director coordinates with the Deputy Chief of Staff, Intelligence (DCSINT) in planning, programming, and budgeting. AFMIC—

- Studies and reports foreign medical S&TI and general medical intelligence to DOD and other Federal agencies.
- Studies and reports foreign biological warfare S&TI capabilities.
- Administers the DOD Foreign Medical Materiel Exploitation Program (FMMEP).
- Provides "quick response" foreign medical intelligence support to DOD and other Federal agencies.
- Maintains a mutually beneficial S&TI exchange with the US Army Intelligence and Security Command (INSCOM) to complement Army capabilities.

***Missile and Space Intelligence Center (MSIC)*.** MSIC, based at Redstone Arsenal, AL, is a DOD intelligence production center under control of DIA and supports the FMEP. The MSIC acquires, produces, maintains, and disseminates S&TI pertaining to missile and space weapons systems, subsystems, components, and activities. The S&TI produced at MSIC also covers foreign state-of-the-art technology and research applicable to missiles. MSIC analyzes—

- Directed energy weapons.
- Antisatellite technology.
- Tactical air defense.

- Short-range ballistic missiles (SRBMs).
- Antitank guided missiles (ATGMs).

Defense HUMINT Service (DHS). DHS conducts worldwide HUMINT operations in support of foreign materiel acquisition and exploitation.

NATIONAL SECURITY AGENCY (NSA):

NSA is the SIGINT organization of the US Government. It is responsible for exploiting cryptologic and electronic warfare (EW) materiel.

DEFENSE ADVANCED RESEARCH PROJECTS AGENCY (DARPA):

DARPA is the central R&D organization for DOD. It manages and directs selected basic and applied R&D projects for DOD and pursues research and technology where risk and payoff are both very high and where success may provide dramatic advances for traditional military roles and missions. DARPA sponsors R&D in all aspects of TECHINT, including imagery intelligence (IMINT), SIGINT, HUMINT, and measurement and signature intelligence (MASINT). For the latest description of DARPA projects, visit the DARPA World Wide Web site on the Internet: http://www.arpa.mil/.

AIR FORCE:

National Air Intelligence Center (NAIC). NAIC is the primary DOD agency producing foreign aerospace S&TI. It satisfies DIA requirements and supports the Air Force Assistant Chief of Staff for Intelligence (AFACSI). NAIC acquires, analyzes, produces, and disseminates S&TI related to current and future enemy aerospace capabilities.

NAVY:

Naval EOD Technical Division and Fire Support and Armament Command EOD. These are the primary training centers of all Joint EOD personnel. Augmented by Army EOD specialists from Picatinny Arsenal, they act as primary centers establishing identification, render safe procedures (RSPs) and demolition procedures for foreign ordnance.

Office of Naval Intelligence. The Navy proponent for TECHINT in the Office of Naval Intelligence (ONI) is designated ONI-23. ONI-23 provides

S&TI on technical characteristics and capabilities of foreign naval forces and merchant systems. It provides S&TI support to the Commander of the ONI and the Chief of Naval Operations.

ARMY:

Office of the Deputy Chief of Staff, Intelligence (ODCSINT). Although ODCSINT does not produce intelligence, it does have general staff responsibility for all Army TECHINT activities. The ODCSINT—

- Formulates policies and procedures for S&TI activities.
- Supervises and carries out the Army S&TI program.
- Coordinates Department of the Army (DA) staff and major subordinate command requirements for TECHINT.
- Is responsible for the Army Foreign Materiel Program (FMP).

US Army Materiel Command (AMC). AMC is a major Army command (MACOM) with a significant support role in TECHINT. Among AMC elements are a series of research, development, and engineering centers (RDECs), the Army Research Laboratory System, and the US Army Test and Evaluation Command (TECOM). Each plays a role in wartime in conducting highly technical evaluations of foreign equipment. In peacetime, the AMC conducts foreign materiel exploitation (FME) on equipment purchased by each laboratory and RDEC for the intelligence community and for DOD as part of the International Materiel Evaluation Program (IMEP).

AMC's Foreign Ordnance exploitation team is at the Fire Support Armaments Center (FSAC) EOD (Picatinny Arsenal). They exploit foreign ground ordnance and develop RSP for foreign ordnance. They also prepare detailed intelligence reports to support EOD, Intelligence, and US munitions developer communities.

Additionally, AMC operates the Scientific Intelligence Center Europe (STICEUR) and Scientific Intelligence Center Far East (STICFE) with the purpose of overtly collecting information on foreign technical developments by attending arms shows and technology exhibitions.

AMC's Chemical and Biological Defense Command (CBDCOM) is the headquarters for the US Army Technical Escort Unit (TEU). This unit has the mission to collect and escort nuclear, biological, and chemical (NBC) samples from the battlefield to CONUS for testing and evaluation.

US Army Intelligence and Security Command **(INSCOM).** Under the direction of Headquarters, Department of the Army (HQDA), INSCOM is responsible for peacetime TECHINT operations. Headquarters, INSCOM, fulfills its responsibilities through its TECHINT oversight function and manages the Army's Foreign Materiel for Training (FMT) Program and FMEP. It does this by—

- Providing the interface with strategic S&TI agencies in support of foreign materiel exploitation.
- Organizing, training, and equipping echelons above corps (EAC) TECHINT organizations during peacetime.

Headquarters, INSCOM, controls two organizations that facilitate TECHINT: National Ground Intelligence Center (NGIC) and the 203d MI Battalion.

National Ground Intelligence Center:

Headquarters, INSCOM, exercises direct operational control over the NGIC. NGIC produces and maintains intelligence on foreign scientific developments, ground force weapons systems, and associated technologies. NGIC analysis includes, but is not limited to, military communications-electronics (C-E) systems which include—

- Types of aircraft used by foreign ground forces (usually rotary wing).
- NBC systems.
- Basic research in civilian technologies with possible military applications.

203d Military Intelligence Battalion:

The 203d MI Battalion, headquartered at Aberdeen Proving Ground, MD, is the only AC TECHINT battalion. The 203d MI Battalion is subordinate to the Force Projection Brigade (FPB) supporting national level S&TI. It—

- Conducts TECHINT and MASINT collection and reporting in support of validated S&TI objectives and MASINT data requirements (MDRs).
- Acts as the HQDA executive agent for foreign materiel used for training purposes.
- Conducts formalized TECHINT and MASINT training for DOD analysts

and RC TECHINT personnel.

- Supports INSCOM's foreign materiel acquisition (FMA) operations and FME operations as directed.

- Supports the Technical Reconnaissance and Surveillance (TECRAS) Program through its MASINT detachment. See Appendix A for MASINT support to TECHINT operations.

All TECHINT assets that reside in the RC are Wartraced to the 203d MI Battalion. Their primary peacetime mission focuses on training. However, certain RC TECHINT units and individuals are tasked to augment real world S&TI missions.

Chapter 3

BATTLEFIELD TECHNICAL INTELLIGENCE OPERATIONS

INTRODUCTION

This chapter describes battlefield TECHINT operations, functions, and procedures. Battlefield TECHINT operations consist of collection, hasty exploitation, initial TECHINT reporting, analysis, evacuation (as necessary), detailed exploitation and analysis, and production and dissemination of final TECHINT products. The term "battlefield" includes any area of operation that US forces occupy while conducting the full range of military operations.

Battlefield TECHINT can start with one conscientious soldier identifying something new in the area of operations and taking the proper steps to report it. The information or item is initially exploited to ascertain if it represents an advantage for the enemy. If it does, the information or item then undergoes increasing levels of analysis until a countermeasure is developed and the technological advantage is neutralized. While a single weapon or technology seldom means the difference between final victory or defeat, it can give one side a battlefield advantage.

A mutually dependent relationship exists between the support the warfighter gets from the TECHINT process and the support TECHINT gets from the warfighter. Operational and tactical commanders identify, capture, protect, and evacuate CEM that undergoes analysis for TECHINT value. TECHINT analysts receive CEM, conduct detailed exploitation, and recommend countermeasures to overcome an enemy's technological advantage.

Another result of this analysis is the development of a new US technology or an enhancement to an existing technology. In any case the end result is the neutralization of the adversary’s technological advantage.

Commanders further ensure the success of the process by demanding TECHINT support to accomplish their assigned missions.

203D MI BATTALION (TECHINT):

The 203d MI Battalion (TECHINT) mission during conflict and war is to provide near-real-time (NRT) intelligence derived from the exploitation of weapons, equipment, and other materiel found, captured, or acquired within the theater area of operations. This includes all items of an S&T nature. This battalion is the centerpiece of the theater TECHINT mission; task-organizing personnel and equipment to support several echelons. Figure 3-2 shows the 203d MI Battalion (TECHINT) organization. The HHC and the TECHINT Exploitation Company form the CMEC. This union is discussed below.

HEADQUARTERS AND HEADQUARTERS COMPANY (HHC):

HHC conducts normal service support operations. In addition, its personnel may be tasked to perform duties as LNEs at various echelons. The S4 section, besides its normal maintenance and logistics staff responsibilities, also plays a significant role in the TECHINT concept of operations. The S4—

- Conducts warehouse operations for all CEE maintained at the CMEC.
- Monitors CEE at the Corps level collection points.
- Monitors captured ammunition and ordnance at Corps ammunition points.
- Assists in the transportation and tracking of equipment from theater to CONUS.

TECHINT EXPLOITATION COMPANY:

The TECHINT Exploitation Company consists of TECHINT collection managers and senior technical analysts in weapons and armaments, mobility systems, EW and communications systems, and chemical, medical, and logistics systems.

During joint and/or combined operations the CMEC may receive joint and/or combined augmentees. In this case, the CMEC is redesignated as the JCMEC or Combined Joint Captured Materiel Exploitation Center (CJCMEC). In all three configurations, the CMEC is commanded by the Commander, 203d MI Battalion. See Appendix B for JCMEC operations and responsibilities.

TECHINT COLLECTION COMPANY:

The TECHINT Collection Company consists of three TECHINT collection teams that normally are attached one per Corps MI brigade. The teams' mission is to conduct the initial identification and exploitation of foreign equipment in support of the Corps and, when directed, theater and national requirements. Additionally, the teams help monitor evacuation of the equipment off the battlefield.

The MI Team (TECHINT) (Collection) serves as the intelligence collection system for the battalion. It consists of TECHINT-qualified soldiers trained in the military occupational specialties (MOSs) shown in Figure 3-3. These teams, trained in TECHINT analysis, deploy forward of the JCMEC

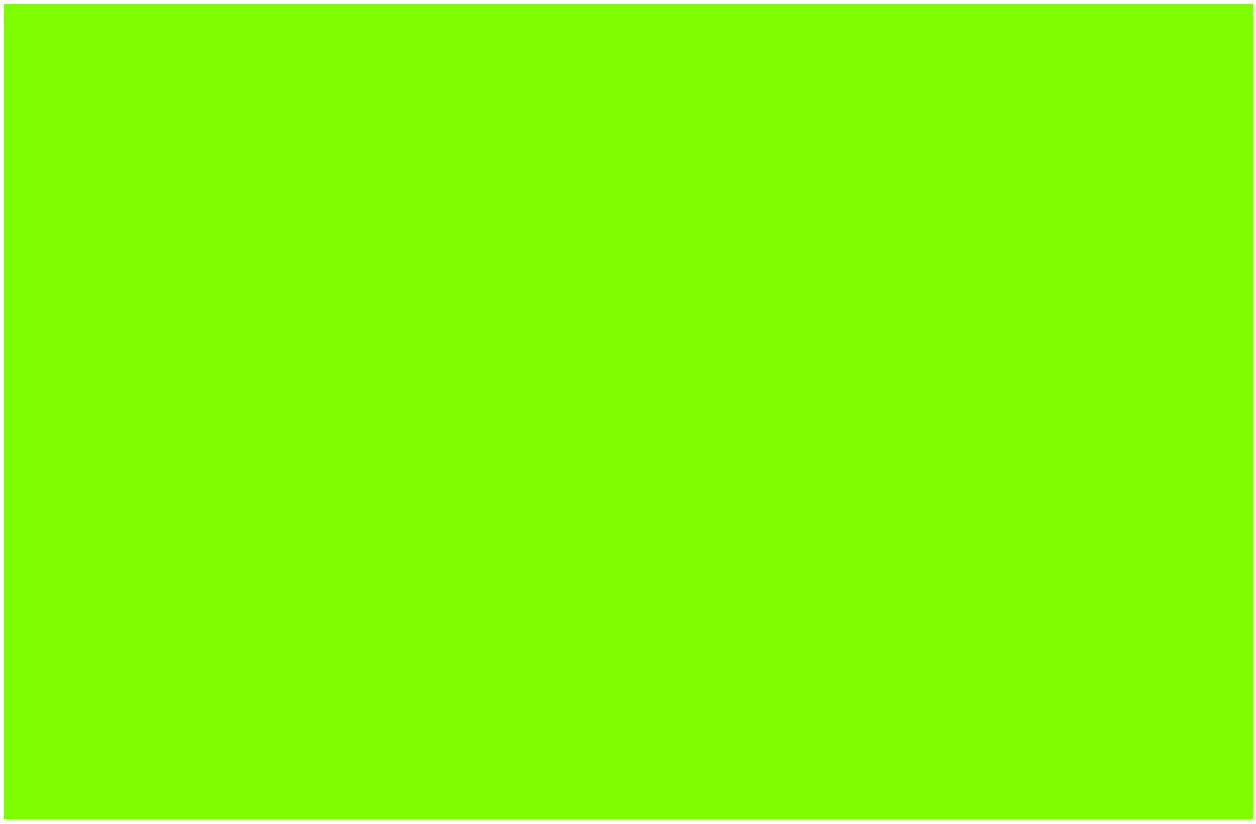
into the Corps area and receive their taskings from the CMEC through

TECHINT LNEs at the Corps G2. CEE is stored in the theater COSCOM.

NTC AND MASINT DETACHMENTS:

The Naval Technical Center (NTC) TECHINT Detachment, currently C Detachment, 203d MI Battalion (TECHINT), is similar to the TECHINT Collection Company in its mission to conduct initial identification and exploitation of foreign equipment in support of Corps, theater, and national requirements. It is organized similar to the TECHINT collection teams that are subordinate to the TECHINT Collection Company. During wartime or contingency it would have the same command and control relationships as a TECHINT collection team. It also has the additional mission of supporting INSCOM's FMT Program at the National Training Center.

The MASINT Detachment attaches MASINT analysts to the TECHINT collection teams and also provides senior analysts to the TECHINT Collection Company.



BATTLEFIELD TECHINT CHANNELS

The battlefield TECHINT channels are designed to support both operational and tactical levels of war. They support warfighting commanders at all levels (see Figure 2-1).

EAC TECHINT support consists of the Joint Technical Intelligence Branch (JTIB) located at the Theater Joint Intelligence Center (JIC), the CMEC formed around the 203d MI Battalion, and TECHINT LNEs located at various EAC analysis and control elements (ACEs). These EAC TECHINT assets provide general support to the theater.

Echelons corps and below (ECB) TECHINT support initially consists of TECHINT collection teams and TECHINT LNEs detached from the 203d MI Battalion. At a minimum, one TECHINT collection team is attached to each Corps MI Brigade. The team takes operational direction from the G2 via the TECHINT liaison officer (LNO) in providing direct support to ECB units from forward locations on the battlefield. A TECHINT LNE is attached to each Corps G2 or component equivalent. Upon mobilization, RC TECHINT units augment the 203d MI Battalion.

Regardless of the echelon, TECHINT elements are equipped to give the supported commander timely, relevant, accurate, and predictive information and recommended countermeasures based on CEM exploitation. This exploitation includes identifying, analyzing, and coordinating the evacuation of CEE, CED, and other CEM. See
Appendix C for procedures for handling and evacuating CEM.

JOINT TECHNICAL INTELLIGENCE BRANCH

The JTIB is formed during joint operations. The JTIB is located at the Theater JIC and is composed of military and civilian TECHINT subject matter experts (SMEs). The JTIB chief is normally the DIA representative and serves as the senior advisor on TECHINT matters to the Theater Commander and the J2.

The JTIB conducts the following missions:

- Coordinates all national, operational, and tactical TECHINT requirements for the theater.
- Develops the theater TECHINT collection plan.
- Coordinates with the J2 and the JCMEC to execute all TECHINT

requirements.

- Provides liaison and coordination support for the JCMEC and the TECHINT collection teams at the JTF level.

CAPTURED MATERIEL EXPLOITATION CENTER

The main effort of the TECHINT mission is executed through a CMEC formed from TECHINT personnel from the 203d MI Battalion. The CMEC is the first major processor of CEM of TECHINT value. The CMEC—

- Exploits CEM based on national, Theater, and supported commanders' requirements.
- Produces TECHINT reports (including countermeasures) for tactical commanders.
- In coordination with EOD, provides render safe procedures (RSPs) for foreign munitions to combat units.
- Coordinates the safe handling and evacuation of CEM.
- Coordinates evacuation of special-interest CEM from ECB locations to the CMEC.
- Supervises evacuation of CEM from theater to CONUS.
- Coordinates with the Theater or Joint Interrogation Facility for the selection and technical interrogation of enemy prisoners of war (EPWs) assessed to have TECHINT-related knowledge. TECHINT analysts may assist interrogators and strategic debriefers during interrogation of a wide range of HUMINT sources of TECHINT interest by conducting "quarterback" debriefing operations with the debriefers.
- Provides accountability for CEE and CEDs within the theater TECHINT structure.
- Recommends CEM disposition to the Theater and Corps commands.
- Maintains the theater TECHINT database.
- Maintains the theater S&TI and battlefield TECHINT requirements.

The CMEC normally is located in the theater rear area near main supply routes (MSRs) and air and sea ports to accommodate rapid evacuation of

equipment. Every effort should be made to collocate the CMEC with the Theater Interrogation Facility to enhance the integration of HUMINT and TECHINT operations.

Additionally, being collocated provides a single geographical area where subordinate units bring captured personnel and CEM, as well as consolidating many transportation and security requirements. Regardless of its location, it is fully equipped with sensitive and sophisticated test and communication equipment. Analyst teams use this equipment to perform detailed in-theater exploitations.

The CMEC can also organize a team from organic CMEC assets to meet immediate requirements of echelons without TECHINT support. These teams can deploy forward or support rear area units as required.

JCMEC AND CJCMEC

The JCMEC and CJCMEC are organized and conduct the same missions as the CMEC. The JCMEC and CJCMEC differ as follows. They—

- Allow a free flow of information, reports, and TECHINT exploitation summaries between joint forces and/or allies; this is because the intelligence support staff is joint and/or combined.
- Coordinate scientific exploitation assistance from joint and/or allied TECHINT analysts.
- May provide direct support US and allied TECHINT teams to joint and/or allied ECB units as required.

TECHINT LIAISON ELEMENTS

The TECHINT LNEs are composed of TECHINT personnel from the 203d MI Battalion. The LNEs serve as advisors on all TECHINT-related matters. The TECHINT LNEs provide coordination and tasking support for the CMEC and the theater TECHINT effort. The TECHINT LNEs consist of one to three TECHINT personnel. Figure 3-4 shows the possible locations of TECHINT LNEs if deployed as part of a JTF.

CORPS CMEC (FORWARD)

An RC TECHINT section may staff a Corps level CMEC (Forward) normally located at the Corps Support Command (COSCOM) area Class VII collection point. Its primary mission is to inventory and identify CEE located at the COSCOM Class VII collection point and screen it for items of TECHINT value.

After identifying an item of TECHINT value, the CMEC (Forward) coordinates with the Corps G4 through the supporting TECHINT LNE for the transportation of the item back to the CMEC. The CMEC (Forward) supports the movement of the CEE by packing or crating it when required. The RC TECHINT section conducts preliminary exploitation and reporting on the identified materiel and assists the Corps TECHINT teams as required.

The RC TECHINT section normally consists of 15 personnel with organic transportation. The section's detailed analysis of CEE may be limited due to number of personnel and organic equipment.

BATTLEFIELD TECHINT COLLECTION TEAMS

The 203d MI Battalion provides direct support TECHINT collection teams to ECB MI Brigades or Marine Expeditionary Force (MEF) intelligence elements. These teams are mobile and organized according to available resources and subordinate command requirements.

TECHINT collection teams perform their mission as a tactical extension of the CMEC. They concentrate on the initial identification and exploitation of CEM and provide TECHINT assistance to Corps and Division G2s. Detailed analysis by these teams is limited due to personnel limitations and lack of extensive diagnostic equipment. The TECHINT collection team normally will have 14 TECHINT analysts and 2 MASINT analysts.

TECHINT collection teams are usually staffed with analysts capable of exploiting threat equipment and documents in eight functional areas: C-E, automation systems, weapons, munitions, NBC, medical, mobility, and signatures analysis. The areas are described below:

- C-E TECHINT is the analysis and exploitation of foreign and threat communications, computers, radars, intercept and jamming equipment, and like systems, including electro-optic and directed-energy technology.

- Automation systems TECHINT is the analysis and exploitation of foreign automation hardware and software.

- Weapons TECHINT involves the analysis of threat weapons and weapon systems, including rocket, tube artillery, mortars, small arms, ATGMs, other missiles, and associated fire control.

- Munitions TECHINT involves the analysis of threat munitions including missiles, NBC munitions, direct and indirect fire weapons ammunition, explosives, and mines.

- NBC TECHINT is based on the analysis of threat offensive and defensive NBC material including NBC samples, flame materials, and obscurants. This analysis determines threat strengths and vulnerabilities in relation to NBC operations.

- Medical TECHINT focuses on the identification, evaluation, and exploitation of medical materiel, general purpose systems modified for medical support, and biological agents sampling.

- Mobility TECHINT exploits threat vehicles, engineer equipment, materiel handling equipment, and power generation. Mobility TECHINT determines the capabilities and vulnerabilities of the enemy to maneuver and support its combat forces on the battlefield.

- Signatures analysis involves collecting and analyzing the acoustic, infrared, and hyperspectral and seismic signatures of foreign equipment.

Historical Vignette

The XVIII Airborne Corps in support of a JTF is engaged in military operations in the country of Zula. During search operations, Company A of the 1st Battalion, 25th Infantry, discovers a recently vacated facility that contains chemicals.

The commander notifies the 1st Battalion S2 and secures the facility until a permanent security force arrives. The Battalion S2 notifies the Brigade S2, who in turn requests that the battlefield TECHINT collection team investigates the facility.

The battlefield TECHINT collection team arrives at the facility and does a cursory evaluation. Upon initial identification, several chemical samples are removed and transported to the Corps CMEC (Forward). The battlefield TECHINT collection team submits a report through channels to the JTF J2 stating that certain suspect chemicals have been found; they've been identified as nerve gas; they will be moved to the Corps CMEC (Forward), and the team will confirm its initial findings in a follow-up report within 4 hours.

Upon receipt, the Corps CMEC (Forward) coordinates with the Corps G4, through the supporting TECHINT LNE, to transport the chemicals to the Corps CMEC.

If identification is made at the Corps CMEC, then the Corps G2 submits a report through the Corps ACE to the JTF J2, for dissemination to the XVIII Airborne Corps G2, 1st Brigade S2, and 1st Battalion S2 for further dissemination to the Commander of Company A (the unit that found the chemicals). The Corps G2 also provides the report to other commanders and staffs within the AO. If identification or further analysis is required, the Corps CMEC coordinates the safe handling and evacuation of chemicals to CONUS for identification and reporting.

Chapter 4

INTELLIGENCE CYCLE APPLIED TO TECHNICAL INTELLIGENCE OPERATIONS

The five-step process known as the intelligence cycle is applied to TECHINT operations to ensure synchronization with the overall all-source intelligence mission and collection plan.

PLAN AND DIRECT

Intelligence preparation of the battlefield (IPB) is the primary intelligence task which helps the J2/G2 focus and direct this step of TECHINT and the remaining steps of the intelligence cycle. Figure 4-1 shows an example of planning and directing.

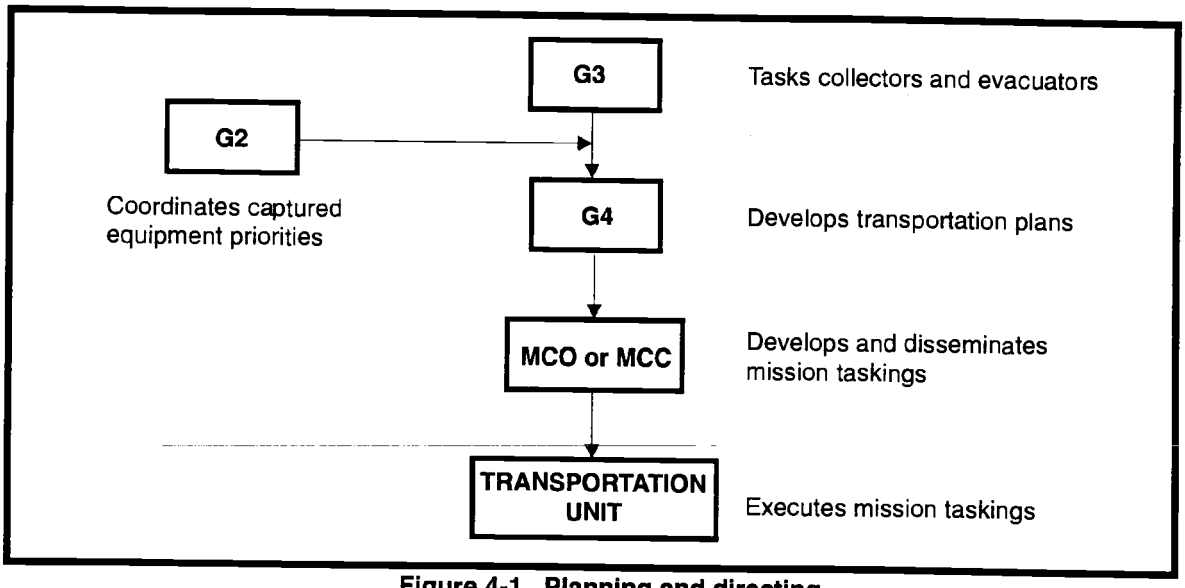


Figure 4-1. Planning and directing.

The JTIB develops the commander's TECHINT priority intelligence requirements (PIR), TECHINT information requirements (IR), and specific information requests (SIR). The JTIB helps develop TECHINT commander's critical information requirements (CCIR) and SIR of a TECHINT nature. The JTIB ensures requirements are closely coordinated with combatant command J2, or theater Army G2 as well as major subordinate commands; for example, corps G2. The JTIB then integrates and deconflicts these CCIR and SIR with other items of special interest to the S&TI community and develops a prioritized TECHINT collection list.

The TECHINT CCIR and SIR and the prioritized TECHINT collection list normally are found in the TECHINT Appendix to the Intelligence Annex to the operations order (OPORD) at all echelons maneuver brigade or group and above.

Through all-source analysis, the JTIB and JCMEC template are where items of TECHINT interest are most likely to be found on the battlefield. This is referred to as "TECHINT templating." Appropriate units are notified, through intelligence, that these items may be within their areas of operations and are tasked for collection through collection management channels. The taskings must be translated into terms that combat, support, and specific collectors can understand.

The taskings should include a TECHINT target folder (TTF). Figure 4-2 shows an example of a TTF. At a minimum, the TTF should include a description of the item, with what major combat systems the item is associated, as well as handling instructions, reporting instructions, and a photograph or sketch if available. The JCMEC and Corps level CMEC (Forward) are responsible for producing TTFs.

1. General information:
    a. Target folder inventory/index.
    b. Record of changes/updates.
    c. Validation/review sheet.
    d. Target identification data—
        (1) Name.
        (2) Description.
        (3) Photographs or sketches (imagery showing location on major end item if TECHINT item is subcomponent).
        (4) Country of origin.
        (5) Other equipment associated with materiel.
        (6) General description/significance (brief explanation of importance of materiel in terms of direct results should its use be denied partially or totally).
        (7) Type of unit materiel is associated with (unit designation if available).
        (8) Disposition instructions.
        (9) References.

Figure 4-2. TECHINT target folder.

Additionally, the JCMEC must develop TECHINT-related indicators and SOR for other intelligence disciplines to augment and complement the single-source TECHINT effort. One example would be the development of TECHINT-related screening questions for EPWs as they are processed. Another might be to request that imagery analysts keep an

eye out for a suspected external modification on a particular model of main battle tank during the normal course of their duty.

COLLECT

TECHINT collection is acquiring foreign materiel, associated technical documents, or other information of TECHINT interest and providing these to the processing and production elements. It includes the maneuver and positioning of intelligence assets to locations favorable to satisfying TECHINT collection objectives.

All TECHINT collection is guided by CCIR, SIR, and the TECHINT collection list. Battlefield TECHINT collection includes capturing, reporting, and evacuating CEM. For that reason, tactical TECHINT and intelligence planners must include a CEM appendix in the Logistics Annex to the OPORD. Logistics is critical in TECHINT collection operations.

Forward deployed units capture or collect items of known or possible TECHINT interest. Capturing units will normally safeguard CEM and report it through intelligence channels to the first TECHINT element in the reporting chain, normally the TECHINT LNE at Corps G2. The Corps TECHINT LNE then forwards the report simultaneously to the JCMEC and JTIB and verifies if the type of materiel captured is required. Further disposition is determined, appropriate coordination is made by the Corps TECHINT LNE with G2/G3 staff, and the capturing unit receives guidance through operational (G3/S3) channels. Figure 4-3 describes the flow of CEM guidance and decisions.

A TECHINT collection team may be sent forward to confirm the identification and conduct initial exploitation of the materiel at the site. Often the items of TECHINT value are subcomponents of major end items. In this case, the collection team removes and evacuates the items using organic transportation, as shown in Figure 4-4.

The capturing unit may be ordered to evacuate the materiel with its organic equipment. In this instance, they will receive detailed instructions from the Corps LNE or direct support TECHINT collection team via G3/S3 channels. The Corps LNE or TECHINT collection team moves to the materiel's location at the Corps CEM collection point when the materiel is not taken directly to a Corps CMEC (Forward) or Theater JCMEC.

TECHINT collection can prove to be a significant force protection multiplier. One example is TECHINT team identification of NBC materiel prior to transport, handling, or destruction of munitions or samples.

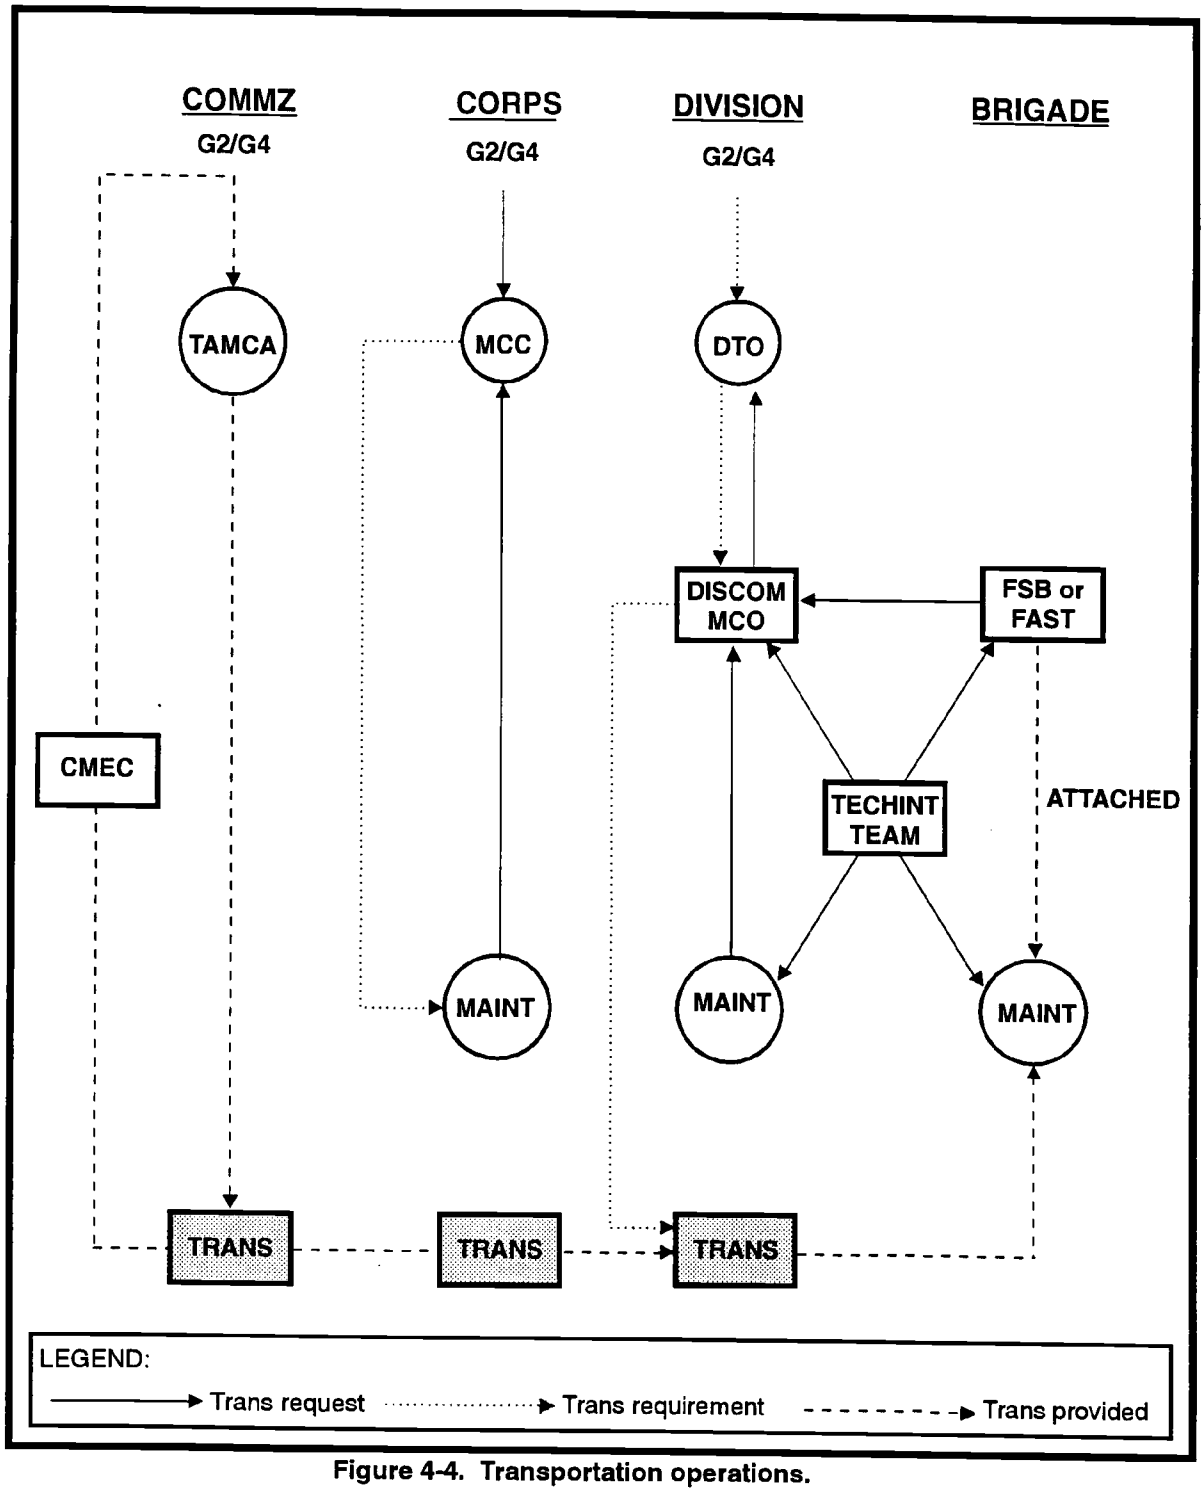

Figure 4-4. Transportation operations.

PROCESS

Processing is the conversion of collected information into a suitable form that can be readily used to produce intelligence. Processing includes data from conversion, photographic development, and transcription and translation of foreign language materiel. Effective processing management ensures that critical information is extracted and processed ahead of information of lesser immediate value. Reports are generated and sent to all appropriate theater and national assets during this process.

TECHINT processing starts with the capture of a piece of equipment of TECHINT value. This confirms that the enemy is indeed employing this materiel. A TECHINT collection team normally conducts a hasty exploitation at the capture site. After the hasty exploitation, a decision is made at the JCMEC or JTIB as to whether the process continues. If it does, the items are sent to the Corps CMEC (Forward) or Theater JCMEC. If the item is deemed to yield no immediate tactical intelligence value, it may still be evacuated to the S&TI centers in CONUS for further analysis if the systems represent a change in the technological posture of an enemy.

PRODUCE

Producing involves the integration, evaluation, analysis, and synthesis of information from single or multiple sources into intelligence. At the tactical level, time constraints and demands of the battle tend to make the processing and producing steps indistinguishable.

TECHINT reports (along with interrogation reports from EPWs with TECHINT knowledge) and digital imagery both funnel into the JCMEC where they undergo the dynamics of production mentioned above. They are then sent to the JTIB and Theater ACE as a single-source TECHINT product.

DISSEMINATE

Dissemination is the timely conveyance of intelligence to users in an easily consumable form. The diversity of forms and means requires interoperability among command, control, communications, and intelligence (C^3I) systems. TECHINT reporting from JCMEC to the Theater ACE will be conducted through existing communications links (See Appendix B for communications architecture).

The JCMEC sends its completed products to the JTIB and to the Theater ACE. This report is based on the standard intelligence information report

(IIR) format. TECHINT reports are then disseminated through two channels. The ACE fuses the TECHINT single-source product into its all-source reports and disseminates them through normal J2/G2/S2 channels. While the TECHINT single-source product is being integrated into the ACE all-source product, the JTIB disseminates the single-source TECHINT product through TECHINT communications channels to the national S&TI centers in CONUS. This ensures both the rapid dissemination of TECHINT and the fusion of TECHINT into all-source products.

The intelligence cycle is a continuous process in which steps are executed concurrently, although not always sequentially. For example, while new information is being collected to satisfy one set of TECHINT requirements, a new TECHINT item may be reported on the battlefield. The JTIB plans and redirects efforts while the intelligence produced from the previously collected materiel or information is disseminated. One or several iterations of the intelligence cycle may be conducted depending on the time constraints of the mission.

BATTLEFIELD TECHINT REPORTING SEQUENCE

THE CAPTURE:

A soldier either captures or observes an item of possible TECHINT interest and does not tamper with it. The soldier quickly reports the encounter via the size, activity, location, unit, time, and equipment (SALUTE) spot report format through the chain of command to the Battalion S2. The soldier then either safeguards the items or continues the mission as directed (see Figure 3-1).

BATTALION S2:

The battalion S2 coordinates security or continued observation of the item with the S3 and ensures the item is not tampered with in any way.

WARNING

Components, control knobs, and switches on C-E equipment **MUST NOT** be touched until the equipment is photographed or positions recorded by TECHINT or other trained personnel to avoid the possibility of immediate personal injury or damage to equipment.

The battalion S2 reports the items in the SALUTE format to the brigade S2, and continues security or observation of the items until receiving further instructions. When possible, the capturing units identify associated items requiring immediate screening for combat information by other supporting

MI elements. This could include C-E systems, code books, or technical documents such as operator manuals.

TECHINT LNE:

The TECHINT LNE at Corps (or lowest level) receives the SALUTE report through intelligence reporting channels. He then compares report information with outstanding requirements to see if collection is necessary. Depending on the priority of the requirement and tactical situation, the Corps LNE may—

- Coordinate with the G3 and MI Brigade Commander to dispatch the Corps direct support TECHINT collection team to the capture site.
- Give further instructions for exploitation and/or evacuation procedures to the capturing unit S2.

If an intelligence requirement no longer exists for the captured equipment, the LNE informs the capturing S2 who disposes of the materiel within normal logistics channels.

In any case, the Corps TECHINT LNE forwards an information copy of the SALUTE report with details of initial actions taken to the JTIB, JCMEC, and other TECHINT LNEs.

BATTLEFIELD TECHINT ANALYSIS

Once a TECHINT unit takes custody of a TECHINT item, battlefield TECHINT exploitation begins. TECHINT analysts and specialists use checklists established by S&TI agencies and the JCMEC to exploit each type of threat equipment for which requirements exist. S&TI and the JCMEC develop battlefield exploitation procedures from four sources:

- The US Army Test and Evaluation Command's international test operation procedures.
- Coordination with S&TI analysts.
- Theater and Corps TECHINT requirements.
- Their own experience.

Exploitation procedures are standardized yet constantly updated and included in different exploitation plans based on the type of equipment or documents being exploited. These plans steer the analysis process.

As the materiel moves through the TECHINT chain, each succeeding level of the exploitation process is completed. TECHINT units maintain procedures and plans for sampling, exploiting, and handling materiel in the following categories:

- Missile guidance systems, warheads, fuses, and propellants.
- Munitions, mines, explosives, and their effects.
- Direct and indirect fire systems of all types and their effects.
- Tracked and wheeled vehicles and transports.
- Various types of armor, radios, and radar.
- EW, intercept, and jamming equipment.
- Communications, antenna, relay, and telephone equipment.
- Teletypes.
- Directed energy weapons.
- Automated data processing (ADP) hardware and software.
- NBC offensive and defensive equipment.
- Tactical aviation.
- Medical equipment capabilities and vulnerabilities.

Although exploitation plans are extremely useful, it is the analyst who determines the actual steps to use in each procedure. Analysis always begins with what is, and what is not, known about the piece of equipment.

Chapter 5

RESPONSIBILITIES

INTRODUCTION

This chapter outlines the various responsibilities of each staff element in units on the battlefield when supporting the overall battlefield TECHINT effort. Battlefield TECHINT elements are resourced and responsible for collecting and processing CEM. Yet to work properly, the battlefield TECHINT structure relies on many other units for mission support, such as combat units which capture items, and the transportation units which evacuate items of TECHINT interest. Figure 5-1 shows staff responsibilities.

STAFF SECTIONS

The duties of coordination staff sections and how they relate to TECHINT direction, collection, processing, production, and dissemination are discussed below. From the J1/G1 to the J5/G5, every staff section contributes in some way to the successful production and use of TECHINT.

ASSISTANT CHIEF OF STAFF, J1/G1, PERSONNEL

The J1/G1 is the principal staff element for the commander on all matters concerning human resources. The J1/G1's involvement in the battlefield TECHINT effort is a result of their primary staff responsibilities for—

- Planning and handling EPW evacuation and processing. The prisoner evacuation channel is one of the richest sources of CEM. All J1/G1 annexes to OPORDs and operations plans (OPLANs) need to state that all CEE will be inspected by TECHINT personnel, and/or be transported to the Corps Captured Equipment Point by the transportation unit within the Corps.

- Directing the command surgeon in captured medical supply disposition and medical intelligence responsibilities.

- Coordinating with the J3/G3 to identify and assign special duty personnel such as JCMEC translators and SMEs.

ASSISTANT CHIEF OF STAFF, J2/G2, INTELLIGENCE

The J2/G2 is the principal staff section for the commander on all intelligence matters and, as such, has primary responsibility for the command's battlefield TECHINT effort. The J2/G2's primary battlefield TECHINT responsibilities include, but are not limited to—

- Providing staff supervision over captured and detained persons with S&T expertise and exploiting CEM.
- Supervising battlefield TECHINT planning, directing, processing, producing, and disseminating.
- Exercising staff supervision over the JCMEC or attached battlefield TECHINT team operations.
- Coordinating battlefield TECHINT collection tasking, with the J3/G3, MI, EOD, NBC, and other combat and combat support units.
- Coordinating with the JCMEC to provide instructions to units capturing enemy materiel, captured medical materiel exploitation, evacuation, and disposition with the command surgeon.
- Coordinating CEM evacuation with the J4/G4. This includes coordinating transportation priorities, disposition, and opportunities to screen CEM in logistic channels.

- Coordinating with the J5/G5 the TECHINT screening of materiel obtained from local nationals, displaced persons, and civilian detainees.

- Coordinating with the staff judge advocate (SJA) to ensure compliance with the Geneva Conventions regarding exploitation of captured personnel and materiel. Ensure that the SJA includes instructions on CEM in the legal annex to OPORDs and OPLANs regarding war trophies and souvenirs.

- Coordinating with the military historical officer to ensure all items of possible historical value are initially screened for TECHINT value.

ASSISTANT CHIEF OF STAFF, J3/G3, OPERATIONS

The J3/G3 is the principal staff section for the commander in matters concerning operations, plans, organization, and training. The J3/G3's involvement in the battlefield TECHINT effort is a result of their primary staff responsibilities. As they relate to battlefield TECHINT, these responsibilities include—

- Coordinating terrain management and clearance or movement issues for TECHINT teams to move about the battlefield as missions dictate.

- Exercising primary staff responsibility over the supporting aviation, chemical, engineer, fire support coordination officers, and the provost marshal (PM).

- Preparing, coordinating, and publishing the command standing operating procedures (SOPs), OPLANs, and OPORDs. This includes instructions for handling CEM, such as collection, reporting, exploitation, evacuation, and disposition.

- Reviewing subordinate command SOPs, OPLANs, and OPORDs to ensure provisions for battlefield TECHINT are included.

- Incorporating TECHINT into current and future operations and plans.

- Assigning, attaching, and detaching battlefield TECHINT assets to subordinate and adjacent commands.

- Advising the commander on friendly use of CEM. This includes to whom the materiel should be allocated, such as irregular or other local national forces.

- Training US troops in the safe disposition and use of CEM.

ASSISTANT CHIEF OF STAFF, J4/G4, LOGISTICS

The J4/G4 is the principal staff section for the commander in matters concerning supply, maintenance, transportation, and services. As the logistical planner, the J4/G4 conducts vital coordination for the TECHINT system. This includes—

- Exercising primary staff responsibility over the EOD officer and the transportation officer.
- Coordinating with the Support Command Commander, who is responsible for logistical support operations; and the J3/G3 for support of battlefield TECHINT collection operations.
- Coordinating and developing command policy for the evacuation and disposition of CEM. Give particular attention to "back-haul" transportation plans for CEM.
- Ensuring that the Service Support Annex to the OPORD has an appendix that addresses CEM.
- Recommending to the J3/G3 the MSR and the main evacuation route of EPWs and CEM.
- Supervising the establishment and the operation of CEM collection points in the unit support area, normally near the Class VII collection point.
- Coordinating the setup and support of the JCMEC and CMEC (Forward) at the Corps collection points.
- Ensuring inventory and storage location records are properly maintained and are reported through materiel management centers (MMC) and TECHINT or JCMEC channels.
- Recommending policies and procedures for the use of captured nonintelligence-value equipment and providing technical staff assistance to the command's MI unit.

ASSISTANT CHIEF OF STAFF, J5/G5, CIVIL AFFAIRS

The J5/G5 is the commander's principal staff officer in all matters

concerning civilians and their impact on military operations. This includes the political, economic, and social effects of military operations on civilian personnel. The J5/G5's involvement in the battlefield TECHINT effort is a result of their primary coordinating staff responsibilities for civilian liaison and Civil Affairs (CA). These responsibilities include—

- Supervising CA functions of the command regarding care and handling of displaced persons, refugees, and any incidental foreign S&T materiel CA personnel may secure.
- Ensuring inclusion of TECHINT collection and notification procedures in all CA SOPs, OPLANs, and OPORDs.
- Coordinating with the command's battlefield TECHINT unit for the screening, exploitation, and evacuation of any CA-secured CEM.
- Coordinating with the J2/G2 and J4/G4 for the return of CEM to the civilian populace.

SPECIAL STAFF OFFICERS

Because TECHINT covers such a broad spectrum of disciplines, activities, and operations performed on the battlefield, the following special staff officers also play an important role in battlefield TECHINT.

AVIATION OFFICER:

- Coordinates with staff movement and transportation personnel for air evacuations of CEM and chemical and biological (CB) samples.

CHEMICAL OFFICER:

- Advises the commander on NBC intelligence matters.
- Recommends employment of chemical troops in support of battlefield TECHINT teams, analysis, and collection operations.
- Plays a key role in the success of the CB sampling mission; ensures that the mission is explained in the chemical Annex of the OPORD.

ENGINEER OFFICER:

- Plans and constructs engineering requirements.
- Incorporates battlefield TECHINT analyses and studies regarding

mobility and survivability characteristics of enemy weapon systems into these OPLANs and OPORDs.

- Provides construction support to JCMEC activities.

EXPLOSIVE ORDNANCE DISPOSAL OFFICER:

- Establishes, operates, and supervises EOD-related TECHINT reporting procedures; includes these reporting procedures in the EOD portion of the OPLAN.

- Coordinates with EOD TECHINT personnel at the JTIB, JCMEC, and TECHINT collection teams for dissemination of EOD TECHINT information.

PROVOST MARSHAL:

- Provides security for designated units, facilities, and convoys, including CEM, along the evacuation route and for TECHINT facilities when tasked by the J3/G3.

- Coordinates with customs for the TECHINT screening of all CEM found at US redeployment or staging sites.

- Establishes procedures to ensure military police confiscate, tag, report, and turn over to TECHINT personnel new or unidentified CEM discovered incidental to EPW handling operations.

THEATER AND SUPPORTING COMMAND SURGEON:

- Uses TECHINT when advising the commander on medical effects of NBC weapons on personnel.

- Coordinates with the theater chemical officer to implement CB sampling procedures.

- Includes CB sampling procedures in the medical portion of the OPLAN.

- Coordinates TECHINT support to examine and process captured medical supplies and equipment; this includes planning and coordinating medical laboratories and personnel to assist in sample analyses.

- Recommends medically related TECHINT PIR and IR to the J2/G2.

- Coordinates the analysis of biological warfare agent specimens collected on the battlefield at the theater medical laboratory.

Coordinates with the J2/G2 and J3/G3 and provides countermeasures, quarantine recommendations, and other appropriate actions to safeguard friendly forces.

AMMUNITION OFFICER:

- Establishes policies for the safe storage and accountability of foreign munitions; also is responsible for the safety certification of foreign munitions designated for reissue to friendly troops.

STAFF JUDGE ADVOCATE:

- Coordinates the Theater war souvenir policy with the JCMEC Commander, JTIB, and the J2. This policy is determined by the deploying commander, based upon recommendations from JAG, G4, and TECHINT procedures.

- Advises on legal matters concerning the movement of CEM out of the Theater.

UNITS AND ORGANIZATIONS

This section describes the responsibilities and duties of specific organizations and units on the battlefield that support TECHINT operations.

JOINT CAPTURED MATERIEL EXPLOITATION CENTER:

The JCMEC's primary function is processing CEM into combat information and TECHINT. The JCMEC is organized around the 203d MI Battalion. When it is further augmented by experts from other nations, it becomes a CJCMEC. Regardless of the command or echelon it supports, it has the same capabilities. The JCMEC—

- Exploits CEE, CED, and CEM.

- Produces TECHINT reports, that include countermeasures, for tactical commanders.

- Provides studies, OPLANs, OPORDs, maps, and special reports to disseminate the JCMEC findings.

- Provides RSPs to combat units for found enemy weapons and enemy munitions, with coordination through joint EOD.

- Coordinates the safe handling and evacuation of CEM with EOD elements.

- Coordinates evacuation of special-interest CEM from ECB locations to JCMEC.
- Supervises evacuation of CEM from theater to CONUS.
- Coordinates with the joint interrogation facility the selection of EPWs for TECHINT exploitation. Supplies interrogators with TECHINT requirements for EPW interrogation.
- Provides accountability for CEM within the theater TECHINT structure.
- Recommends CEM disposition to the Theater and Corps commands.
- Maintains the theater TECHINT database.
- Maintains S&TI and battlefield PIR, IR, and list of special interest items.

CAPTURING UNITS:

Combat units are usually the first to encounter new or modified threat materiel. However, other units such as engineers, military police, NBC teams, and logistic units may also encounter or capture such materiel. This materiel often comes with operating instructions and other technical documents. The intelligence officer at each echelon coordinates with J2/G2/S2 regarding TECHINT and captured or encountered threat materiel and documents. Together, they establish unit security, RSPs, reporting, and dissemination procedures for CEM.

Capturing units must strive not to destroy TECHINT materiel known or believed to answer PIR, IR, special interest lists, or unidentified or new items before receiving disposition instructions. CEM and logistics complexes must be safeguarded and reported through intelligence channels. Captured items known or believed to answer TECHINT requirements are reported via SALUTE format to higher command normally to the Corps TECHINT LNE.

MILITARY INTELLIGENCE UNITS:

The attachments of TECHINT teams less operational control (OPCON) to MI units (for example, one TECHINT team per corps MI brigade) enhances TECHINT operations, as well as improves coordination and synergy among all MI disciplines. MI units are normally best able to provide administrative and logistical support to forward deployed TECHINT teams due to like missions and collocation.

All MI units are responsible for establishing SOPs and having procedures for handling, screening, and reporting TECHINT-related items or

information encountered incidental to normal organizational activities. The following items relate to enemy C-E systems:

- Code books.
- Frequency tables.
- C-E operations instructions.
- C-E standing instructions.
- Cryptographic data.
- Cryptographic items.
- Encrypted items.
- C-E hardware or software.
- Examples of materiel, including CEE and CED, requiring immediate MI screening.

SPECIAL OPERATIONS FORCES:

Special Operations Forces consist of special forces and ranger units, special operations aviation units, psychological operations (PSYOP) teams, and CA elements.

Special Forces and Ranger Units. These forces usually operate deep in enemy-controlled areas. This means they are generally the first to discover, identify, and provide information on a variety of TECHINT-related CEE, CEDs, or facilities. They can provide—

- New or previously unacquired materiel.
- Locations of enemy materiel.
- Other technical data.
- Capture of enemy S&T personnel.

***Special Operations Aviation Units*.** Special operations aviation units provide aviation support to units conducting special operations missions usually deep within enemy-controlled areas. These units can provide technical data on enemy radars, as well as on observed enemy equipment. Incidental to assigned air missions, special operations aviation units can often "back-haul" limited amounts of priority CEM to rear areas.

Psychological Operations Teams. PSYOP personnel support theater, corps, and division. Historically, PSYOP has supported TECHINT collection through creative PSYOP designed to secure TECHINT-related CEM, information, and/or personnel.

An example of a PSYOP success comes from the Korean War. A North Korean pilot was paid a $100,000 bounty for flying his Soviet MiG-15 to the south, after the bounty was offered by leaflet and radio. The benefits were enormous. The Communists grounded all MiG flights for eight days; and getting the MiG turned out to be a TECHINT windfall.

PSYOP specifically designed to provide TECHINT occurred during the Vietnam War. A PSYOP campaign encouraged enemy soldiers to surrender with their weapons and equipment intact; rewards were offered and paid to Viet Cong and NVA troops who did this. This type of campaign not only reduced the number of weapons available to the enemy but also provided a continuous source of materiel for the CMEC to exploit.

Civil Affairs Elements. These elements provide support to tactical and operational commanders by coordinating between military forces, civil authorities, and area of operations personnel. CA support to the battlefield TECHINT process includes—

- Providing SMEs to assist in the TECHINT analysis of food and agriculture; public communications, health, transportation, and supply; public works and utilities; and centers of commerce and industry.

- Securing TECHINT-related materiel and foreign experts having CA wartime responsibility for civil administration and refugee handling.

ENGINEER TOPOGRAPHIC AND TERRAIN UNITS:

These units are responsible for collecting, evaluating, and disseminating topographic information and terrain intelligence. They normally function at theater, corps, and division levels. TECHINT units use engineer topographic and terrain products to support TECHINT collection planning. Engineers also support analysis and exploitation of CEM and facilities when this materiel is within their field of expertise.

MILITARY POLICE:

The military police fulfill a wide range of duties on the battlefield, to include providing route security for evacuating CEM and handling EPWs. In performance of these duties they often confiscate CEM from EPWs. Military police follow specific procedures for notifying MI personnel of equipment or documents of intelligence interest discovered incidental to EPW handling operations.

If not done previously, military police mark or tag all CEM and personnel in their custody. Since EPWs and materiel may become separated, military police use a three-part capture tag to clearly identify which prisoner the CEM came from. Accurate identification of the capture tag helps TECHINT analysts and interrogators match materiel with associated EPWs. It also makes it easier to return certain property to the EPW. (See Appendix C for an example of an EPW capture tag.)

NBC RECONNAISSANCE TEAMS:

NBC reconnaissance teams locate, identify, and mark contaminated areas. They collect, identify, and evacuate suspected samples of nuclear materials and CB warfare agents. This function is an important supplement to normal TECHINT collection capabilities. Collecting, handling, storing, and shipping these samples must be done using SOPs developed in a coordinated effort between the command surgeon, the staff NBC officer, and the staff S2. All parties involved must ensure they maintain a legal chain of custody of NBC samples for later possible war crimes processing.

MEDICAL UNITS:

Combat zone and communications zone medical support units are capable of giving specialized medical, laboratory, and medical intelligence assistance to TECHINT and other MI disciplines. The medical unit's S2 coordinates this assistance to MI units.

EXPLOSIVE ORDNANCE DISPOSAL:

One of the most critical and early sources of TECHINT on the battlefield is explosive ordnance. To safely exploit this source, EOD units provide specially trained personnel to support TECHINT collection teams and units in the area of operations. EOD personnel examine existing databases and prepare reports on new and unusual items of explosive ordnance for TECHINT purposes.

TECHINT personnel should be familiar with EOD activities, capabilities, and responsibilities, as described in AR 75-15. Foreign explosive ordnance is extremely important to TECHINT analysts. TECHINT personnel coordinate closely with EOD personnel for proper disposal and evacuation of explosive ordnance, particularly when conducting initial inspections during hasty exploitations of CEM on the battlefield.

DANGER

Exercise extreme care and awareness when encountering possible booby-trapped CEM. Materiel may be booby trapped and cause immediate death or permanent injury.

Only EOD personnel actually handle explosive ordnance. Conversely, EOD units must notify TECHINT personnel of the types and locations of foreign equipment and munitions they encounter.

Appendix A

MEASUREMENT AND SIGNATURE INTELLIGENCE

INTRODUCTION

This appendix describes the MASINT mission, organization, responsibilities, and their relevance to TECHINT. Specific definitions are in the glossary. This appendix delineates MASINT's dual mission of supporting the S&TI community as well as providing unique time-critical information to the supported tactical commander that contributes to battlespace dominance.

MISSION

PEACETIME:

The mission of MASINT operations in peacetime includes fulfillment of intelligence collection and transition to war requirements. Army MASINT efforts are focused at EAC MI force at the force projection brigades. Technical reconnaissance and surveillance (TECRAS) systems fielded at EAC demonstrate the feasibility of MASINT support at that level.

Successful demonstration is expected to lead to the development of tactical intelligence and related activities (TIARA) systems and their progressive fielding at appropriate EAC and ECB units. EAC conducts operations to fulfill collection requirements levied by the Army component command, theater, DOD, or national levels. The force projection brigade's mission includes the collection of S&TI to support baseline signature requirements for reprogrammable munitions in support of Army, DOD, and national requirements.

WARTIME:

In addition to its contributions to S&TI, MASINT also serves the warfighting commander. MASINT collection of threat battlefield equipment signatures aids in the prevention of technological surprise and is critical to US ability to produce effective countermeasures. Continued signature collection by MASINT sensors permits reprogramming of precision-guided, smart, or brilliant munitions. Specific MASINT missions are to—

- Detect, identify, and locate targets with sufficient timeliness and accuracy for operational planning, targeting, and combat action.

- Support IPB.
- Support force protection via identification, friend or foe (IFF) systems.
- Support terrain visualization and geographic intelligence.
- Provide intelligence on threat signatures and equipment and technological advances not discernible by other intelligence collection means.
- Support indications and warnings (I&W) intelligence in peacetime and provide an indication of threat escalation from conventional to nuclear war.
- Provide intelligence to support the commanders' demands for situation development, target development, battle damage assessment (BDA), and intelligence operations in close, deep, and rear operations.
- Provide information to detect or confirm enemy deception operations.
- Provide information of threat strategic facilities, such as power plants, design bureaus, production facilities, proving grounds, and test areas.
- Provide commanders with information of friendly signature profiles. This information will be used for IFF to minimize fratricide and to alter signatures for operations security (OPSEC) or friendly deception operations.

ORGANIZATION

The Army’s MASINT organization is shown at Figure 2-1.

RESPONSIBILITIES

Figure A-1 shows the responsible agencies, along with their MASINT functions.

AGENCY	RESPONSIBILITY

DIA, Central MASINT Office	Executive agent for MASINT.
HQDA, DCSINT	Functional manager of TECRAS Program.
AMC, DCSINT	Materiel developer.
INSCOM, DCSOPS	Manages and oversees operational MASINT EAC collection operations. Develops operational requirements documents and mission needs statements.
NGIC, Signatures Division	Primary consumer of TECRAS data.
Force Projection Brigades	Ensure national MASINT sensors are tasked to support commander's PIR. Serve as focal point for collection management and dissemination for MASINT. Collect baseline signatures in support of the TECRAS Program. Augment the Theater IPC upon request. Act as the conduit for fielding selected RDTE MASINT systems.

Figure A-1. HQDA agencies and their MASINT responsibilities.

DEFINITIONS

The definitions for MASINT and electro-optical intelligence (ELECTRO-OPTINT), as defined in JCS Publication 1-02, are shown in the terms and definitions section of the glossary.

ELECTRO-OPTINT:

ELECTRO-OPTINT may provide detailed information on the radiant intensities, dynamic motion, spectral and spatial characteristics, and the materials composition of the targeted objective. Electro-optical data collected has broad applications to a variety of tasks. Data may be collected by a variety of optically sensitive devices, such as radiometers, spectrometers, non-literal imaging systems, lasers or laser radar—laser detection and ranging (LIDAR).

RADAR INTELLIGENCE (RADINT):

RADINT is the collection, processing, analysis, and exploitation of radar energy reflected (re-radiated) from a target or objective. Instruments for active target illuminations may include monostatic or bistatic, line-of-sight (LOS) phased array, synthetic aperture radar (SAR), and over-the-horizon systems. RADINT collection provides information on radar cross-sections, tracking, precise spatial measurements of components, motion, and radar reflectance and absorption characteristics for dynamic targets and objectives.

RADIO FREQUENCY INTELLIGENCE:

This includes radio frequency/electromagnetic pulse intelligence (RF/EMPINT) and unintentional radiation intelligence (RINT).

- RF/EMPINT is the collection, processing, analysis, and exploitation of radio frequency electromagnetic pulse emissions associated with nuclear testing or other high energy events for the purpose of determining power levels, operating characteristics, and signatures of advanced technologic weapons, power, or propulsion systems.

- RINT is the integration and specialized application of multiple MASINT collection, processing, analysis, and exploitation techniques against unintentional radiation sources that are incidental to the design and operating characteristics of military and civil propulsion units, power sources, weapons systems, electronic systems, machinery, equipment, or instruments. These techniques may be valuable in detecting, tracking, and monitoring a variety of activities of interest.

GEOPHYSICAL INTELLIGENCE:

This is the collection, processing, exploitation, and analysis of emitted or reflected sounds, pressure waves, or vibration in the atmosphere (acoustic), in the water (acoustical intelligence), or in the earth's surface (seismic). Acoustic and seismic sensors may be valuable in target detection and classification, measuring aircraft and ship performance characteristics, detecting weapons testing and large military movements.

MATERIALS INTELLIGENCE:

This is the physical collection, processing, analysis, and exploitation of atmospheric trace elements; gaseous, liquid, or solid particulate; effluents; or debris. Materials intelligence has specific applications to NBC warfare, military and civil production, and economic and environmental problems.

NUCLEAR INTELLIGENCE (NUCINT):

NUCINT is intelligence information derived from the collection and analysis of radiation and other effects resulting from radioactive sources, such as nuclear weapons, processes, materials, devices, or facilities. Nuclear monitoring includes nuclear radiation detection, identification, and characterization of sources and events. Data exploitation results in nuclear signature of weapons or materials.

TECHNICAL RECONNAISSANCE AND SURVEILLANCE:

TECRAS is DA's special program using a low density of instrumented collection sensors which provide a quick-reaction capability for collection.

ARMY REPROGRAMMING ANALYSIS TEAM (ARAT):

The ARAT is involved in altered signatures identification and associated weapon systems impact. The US Army target sensing systems (TSSs) incorporate software algorithms used to make threat identification based on embedded preprogrammed threat parameter data.

As the threat capabilities change, or as new threats become operational, there is a risk that these systems will not correctly identify the threats. To the extent the threat is misidentified, incorrect countermeasures may be implemented putting friendly forces at risk.

Reprogramming the weapon systems provides the commander an essential element in battle space dominance by allowing him to defeat enemy countermeasures. The production centers and the intermediate processing centers (IPCs) validate suspected change signatures or countermeasures. The ARAT receives data upon which the threat change is identified and system assessments made. The ARAT determines impact of validated threat changes on assigned Army equipment and weapon systems and develops a suitable and achievable counter to the changes. The mission requirements center (MRC) within the systems manager’s organization determines requirements for Army systems. The software support center (SSC) is responsible for developing the change program and validating the change.

CONCLUSIONS

MASINT’s chief contribution to the Army to date has been support to force modernization, a role which is likely to continue. However, it is also an evolving discipline which holds significant potential for warfighting intelligence as adversaries develop means to deceive or evade imagery

and signals sensors.

Much can be gained by integrating MASINT and TECHINT. The disciplines are not competing but complementary. Many MASINT technologies and subdisciplines lend themselves towards bringing traditional TECHINT into the information age. Sensors are used to derive information in NRT, so that it can be fed to the supported commander in time to effect the decision cycle.

Appendix B

JCMEC OPERATIONS

This appendix provides an overview of JCMEC operations and responsibilities; it is used as an example for an annex to a combatant command's TTP document. Each reference to the "supported Theater Commander" may be replaced by the appropriate unified or joint combatant command acronym (for example, ACOM, PACOM, CENTCOM).

INTRODUCTION

The JCMEC (in part or whole) normally will be established for any operation where significant amounts or types of CEM will be available and/or require field exploitation. The supported Theater commander has the mission of establishing and operating a JCMEC through the 203d MI Battalion (TECHINT), FPB, and provides for the day-to-day operation of the JCMEC to include administration, logistics, systems, communications, and maintenance.

The supported Theater commander also has staff responsibility for—

- Ensuring security of the materiel.
- Arranging for the evacuation and movement of CEM.
- Providing legal guidance concerning disposition of certain CEM, structures, and facilities.
- Coordinating for EOD.
- Coordinating the issue of CEM to US forces.

The Theater J2 exercises operational control of the JCMEC through the JTIB located at the JIC. The JTIB consists of the senior TECHINT representatives from DIA's Technical Directorate and Service TECHINT organizations (National Ground, Air, and Maritime Intelligence Centers as needed). The JTIB will be augmented with an LNE from the 203d MI Battalion (TECHINT).

The purpose of a JCMEC is to provide a central in-theater location for the collection, safeguarding, identification, battlefield exploitation and

reporting, and destruction and/or evacuation of specified captured foreign and US manufactured materiel. The JTIB—

- Provides TECHINT advice and assistance to the Theater J2.
- Acts as the TECHINT collection manager for the Theater J2.

CONCEPT

The JCMEC will be sited by the supported Theater commander. The site should facilitate evacuating, storing, and shipping CEM. The JCMEC also will—

- Locate to facilitate security.
- Ensure safety for nearby forces and the local populace.
- Provide easy access to communications, transportation, and other support facilities.
- Locate near the Theater ordnance storage site.

JCMEC facilities have common site selection criteria and complementary functions which provide efficient allocation of assets for evacuation, movement, safeguarding, and exploitation of EPWs and CEM.

JCMEC will be staffed by the 203d MI Battalion (TECHINT) and augmented by selected service technical representatives and support personnel. Through the supported Theater commander, the JCMEC will have support from military police or security forces, ground and aviation transportation elements, EOD, and other activities as needed.

In accordance with DOD directives, service regulations, and other established policies, all units will collect, identify, tag, secure, and evacuate CEM to designated collection points.

In coordination with the JCMEC, and through technical teams and liaisons, Corps and equivalent units will transport or arrange for the transportation of selected items to the JCMEC. In cases of the reported capture of designated CEM of high TECHINT priority and/or time sensitivity, a TECHINT collection team will be deployed to the capture site to conduct initial exploitation and then coordinate and prepare the materiel for hasty evacuation directly to the JCMEC.

JCMEC will function as the Theater's central captured materiel exploitation facility. As such it will—

- Establish procedures for the exploitation, destruction, or other

disposition of CEM in coordination with the J4.

- Recommend the theater souvenir and war trophy policy, to include demilitarization procedures.
- Issue and provide training on the operation of CEM to US forces, allied, and host nation forces based upon J3 requirements and priorities.
- Return specified CEM to the sovereign nation at the end of the conflict as directed.

ORGANIZATION

The JCMEC and its components can and will be tailored for each operation depending on types and quantities of CEM. Although operationally responsible through the supported Theater commander for the JCMEC, the commander and deputy are responsible to the J2 through the JTIB for intelligence collection management and oversight of the JCMEC. Figure B-1 shows the JCMEC organization. Following are specific functions of the JCMEC components.

COMMANDER AND THE DEPUTY:

The 203d MI Battalion (TECHINT) commander is dual hatted also as the JCMEC commander and is assisted by a deputy, battalion S3, or Executive Officer (XO). The commander will tailor the CMECs to meet the worldwide mission.

LIAISON ELEMENTS:

FME LNEs will be attached to each component G2, Air Force and Navy Intelligence, and Corps, or the equivalent subordinate command. These LNEs will advise the supported command on CEM handling, control, and evacuation procedures and coordinate these efforts with the JCMEC.

OPERATIONS CENTER (OPCEN):

The OPCEN director works directly for the JCMEC commander. The OPCEN is responsible for planning and coordinating all current and projected JCMEC operations, to include deploying TECHINT collection teams and maintaining the current intelligence situation.

SUPPORT CENTER (SUPCEN):

The SUPCEN director works directly for the JCMEC commander. The SUPCEN provides administrative and logistics support to all JCMEC elements.

The warehouse section chief works directly for the SUPCEN director. This section maintains all records on CEM, structures, and facilities that are processed through or by the JCMEC. Specifically, the Warehouse Section—

- Serves as the point of contact (POC) for the various units or organizations delivering and/or transferring materiel.

- Ensures that documents, manuals, inventory records, and other related items are cataloged and properly exploited.

- Ensures exploitation elements are informed of materiel and documents received at the JCMEC.

- Coordinates and monitors the shipping of materiel to CONUS and/or issuance to US forces, allies, or host nation as directed.

EXPLOITATION CENTER (EXCEN):

The EXCEN director works directly for the JCMEC commander. The EXCEN director prioritizes, coordinates, and deconflicts the efforts of his subordinate elements based on the JCMEC commander's guidance. Elements subordinate to the EXCEN director and their functions are as follows:

- Ground Exploitation Element. This element processes validated requirements; exploits captured ground materiel (to include helicopters and ground-based missile systems); produces tactical TECHINT reports; ensures that reports are forwarded to the CM&D section expeditiously; and participates in technical interrogations in coordination with the joint interrogation facility.

- Air and Missile Exploitation Element. The structure and functions are the same as for the Ground Exploitation Element except that the focus is on aviation (aircraft, air delivered weapons systems, and associated radar and tracking systems) and missile-related materiel.

- Maritime Exploitation Element. The structure and function are the same as the Ground Exploitation Element except that the focus is on naval and marine materiel (to include naval mines, vessels, naval aviation, and naval-related missile systems).

- Medical and NBC Exploitation Element. This element's function, in addition to exploitation and reporting on NBC weapons and materiel, is to be responsible for removal and shipment of samples from the area of operation. This element will ship suspected samples to the Theater Army Medical Laboratory (TAML), if available, or to CONUS- based laboratories for analysis.

- C-E and IEW Exploitation Element. This element focuses on

communications, computers, intelligence and electronic warfare (IEW), and related systems.

- CM&D Element. The collection management and dissemination (CM&D) element provides a single POC to ensure that effective coordination is maintained between the JCMEC and the numerous component, theater, national, allied, and host government units. This element will ensure the receipt and satisfaction of all requirements. Specific functions are as follows:

  — Operate joint and Army automated file servers and associated work stations that are used for receiving requirements and disseminating technical reports. Figure B-2 shows the TECHINT communications architecture.

  — Coordinate directly with the J2 TECHINT collection manager for receipt of validated requirements (collection and production). Ensure that exploitation elements receive these requirements; monitor the status of the requirements; and close them when appropriate.

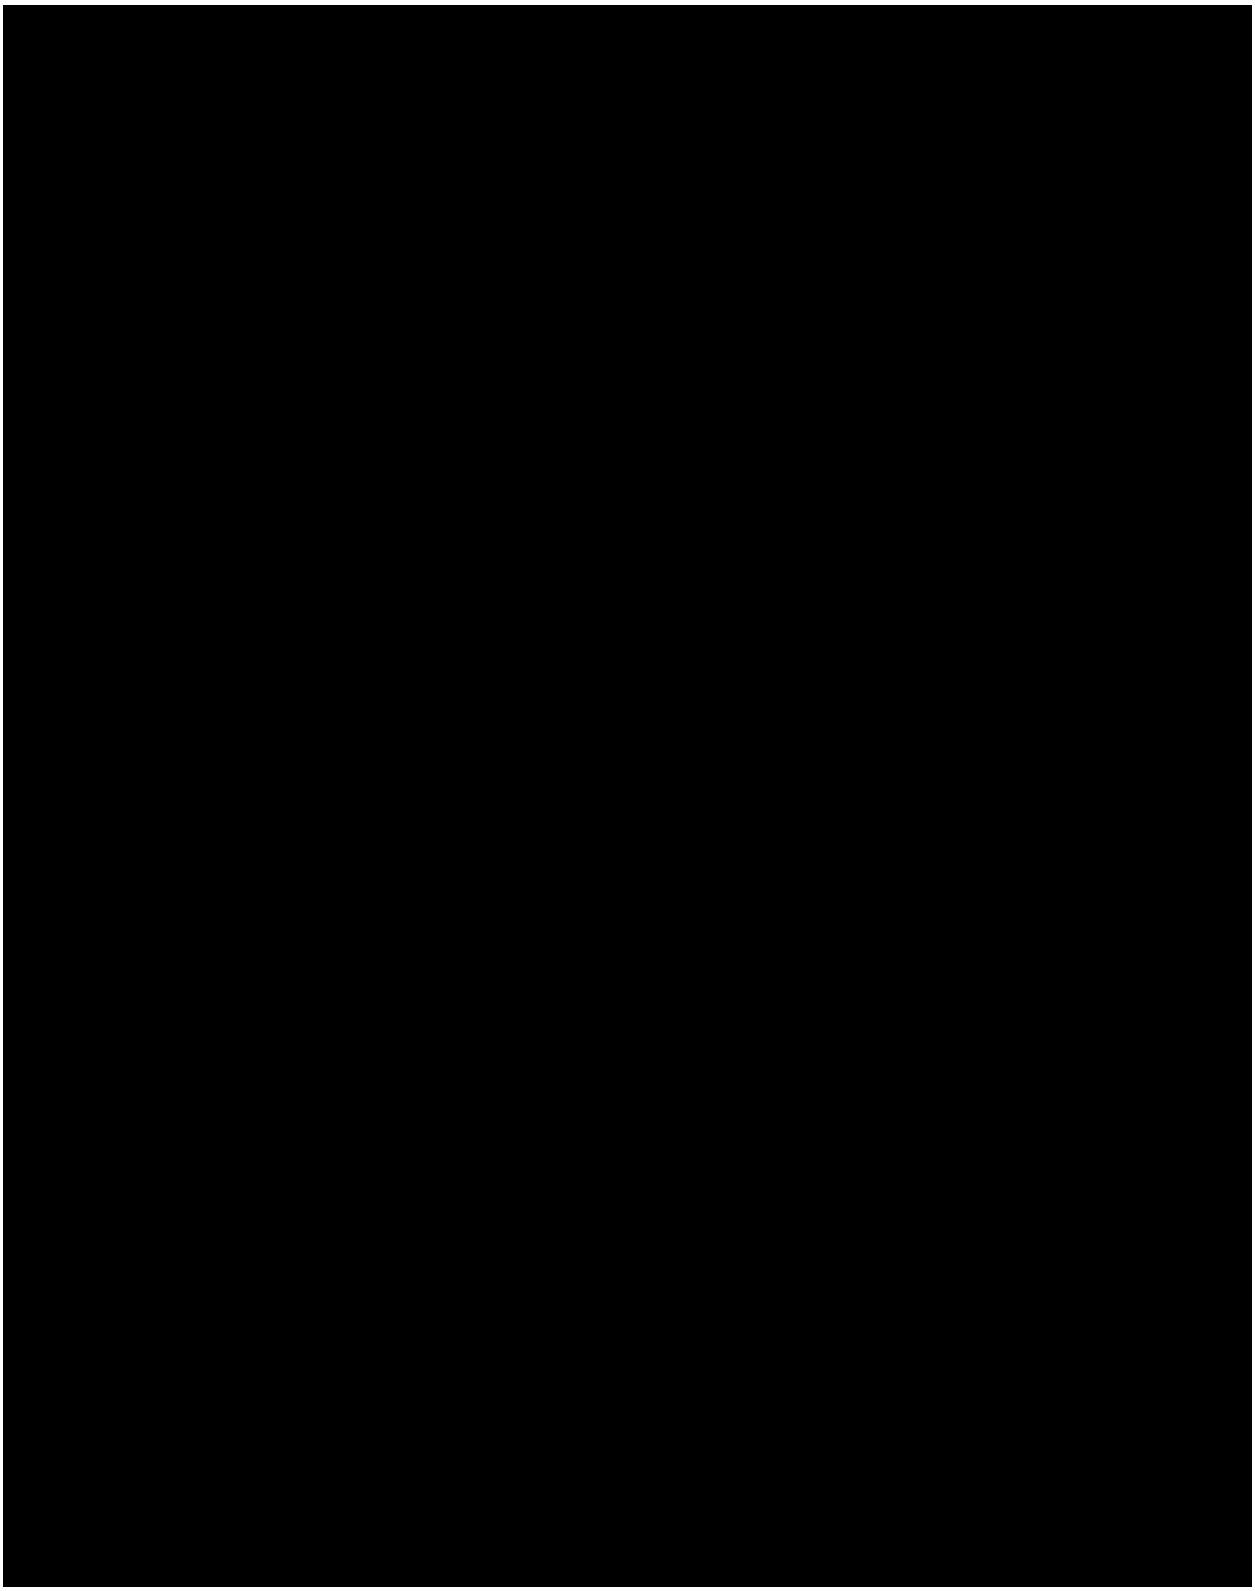
  — Take reports from the elements and ensure that they are disseminated expeditiously to units and organizations that need the information. Dissemination can be by any or all means; for example, secure voice, facsimile, message, Joint Deployable Intelligence Support System (JDISS). Information should be given the widest dissemination possible.

SIGNAL CENTER (SIGCEN):

The SIGCEN director works directly for the JCMEC commander. The SIGCEN provides communications, systems, and related maintenance support to all of the JCMEC elements. It acts as the focal point for all communications in and out of the JCMEC.

COLLECTION COMPANY:

The commander of the TECHINT Collection Company works directly for the JCMEC commander. This company is augmented by a Joint EOD detachment and forward deploys three TECHINT collection teams. The collection teams assist in recovering, processing, tagging, and shipping materiel to the JCMEC. They also perform screening and make field assessments of "first seen" materiel encountered by US personnel. The EOD detachment consists of personnel from the Services who are familiar with weapons systems, ammunition, and ordnance related to their



respective areas. This detachment works for the TECHINT Collection Company commander but provides EOD support to all JCMEC elements.

SPECIAL ACTIVITIES:

There will be times and places where other US, allied, or host nation government agencies, organizations, or elements may be required to support the foreign materiel efforts of the JCMEC.

COMMUNICATIONS

The supported commander provides communications for the JCMEC. The J2/G2 validates all requirements and coordinates with the J6 to ensure that the required bandwidth and types of circuits are provided.

Normal JCMEC operations will require the following minimum intelligence processors and connective communications capabilities:

- JDISS and/or a compatible file server and workstations. This system is essential for access to databases, collection and production requirements processing, and dissemination. Since there will be a requirement for a Sensitive Compartmented Information Facility (SCIF), and split-based operations to and from Aberdeen Proving Ground, MD, both DSNET 1 and DSNET 3 connectivity with a minimum of 32 Kb bandwith will be essential.
- Disk operating system (DOS) stand-alone terminals for report writing and records administration.
- Automated message access.
- Dial-up STU-III secure telephone.
- Classified and unclassified facsimile.
- Other specialized communications as required to support the forward teams (such as tactical high frequency, ultra high frequency, super high frequency, and satellite communications [SATCOM]).

OTHER REQUIREMENTS

See DIAMs 58-4, 58-13, and 75-1 and references herein for procedures and requirements for identifying, safeguarding, controlling, and disposing of CEM.

Appendix C

HANDLING AND EVACUATION

INTRODUCTION

This appendix covers the procedures for handling and evacuating routine CEM, as well as TECHINT CEM. Some basic guidelines and procedures on how to handle TECHINT interest items follow:

- CEM evacuation channels and handling procedures are usually the same as similar US end items. A captured tank generally will go to the same location as a US tank at the Class VII point. (Definitions for classes of supply are in the glossary.)

- The element requiring a specific type item is responsible for coordinating and tasking evacuation and handling.

- As time permits, as much CEM should be collected from the battlefield and taken to the echelon's CEM points for disposition.

- The capturing unit always notifies higher command of capture and then safeguards the known or possible TECHINT item, if possible, until higher command provides disposition instructions.

- All echelons will establish CEM points and keep logistical and intelligence channels informed of their status.

- Special handling and evacuation procedures are often situation dependent and cannot always be included in SOPs and OPORDs.

The plans, policies, and procedures for evacuating foreign materiel are prescribed by joint, unified, and theater headquarters. These plans are based on DA and DOD policies and guidance. Each command echelon in theater must ensure that its plans comply with theater directives and the Joint TECHINT plan. The final disposition of CEM and associated technical documents rests with the theater commander.

As stated before, the CMEC is responsible for coordinating the handling and evacuation of CEM of TECHINT value. Routine CEM evacuation guidance, such as raw material found in railroad yards, is best established in advance in the command's various OPORDs and SOPs. CEM should be policed off the battlefield to the prescribed collection points as soon as possible. Special situations, as in the case of high priority TECHINT

interest items, require active coordination among the JCMEC and the command's different assets to move the item quickly.

Coordinating and tasking is the job of the echelon commander's staff for normal CEM movement. Their ability to coordinate between the logistic units that move the item and the specialist elements such as TECHINT, EOD, and NBC is the key to the reuse, intelligence exploitation, and removal of CEM.

LOGISTIC CHAIN OF RESPONSIBILITIES AND FUNCTIONS

Logistic assets will evacuate CEM to the collection points, Corps CMEC (Forward), theater CMEC, or CONUS. They do this according to available assets and the priorities set by the commander and staff. The J4/G4 is the principal staff element charged with coordinating this task. The command surgeon, responsible for medical items, coordinates disposition of Class VIII not of TECHINT value.

The J4/G4 provides staff guidance to the MMC and the movement control office (MCO) or the movement control center (MCC). The MMC controls combat service support (CSS) and maintenance inventories and is the management arm that ensures proper accountability of CEM during transit.

The support commands are the Division Support Command (DISCOM), COSCOM, and Theater Army Area Command (TAACOM). They exercise command and control over supporting units in carrying out the directives issued by the J4/G4. The division medical supply officer (DMSO) or the medical, supply, optical, and maintenance (MEDSOM) are the first elements that manage the command's collection, inventory, and evacuation procedures and functions for captured medical materiel.

The MMC manages the command's collection, inventory, and evacuation functions. This includes the operation of the CEM point. The MMC operations staff is organized by function and commodity, Class I through Class VII, and Class IX materiels. CEM will normally be managed by the Class VII operations staff. The MMC keeps the records of the CEM at the CEM point. TECHINT elements, such as the Corps CMEC (Forward) or TECHINT teams, would provide support to logistical personnel operating the CEM point for identification of CEM.

TRANSPORTATION PLANNING AND ALLOCATION

The J4/G4 coordinates logistic support for evacuation of CEM operations by developing a command transportation plan. The command transportation officer and the movement control element use the transportation plan to task individual transportation units. Transportation elements can be effectively used to backhaul CEM to the CEM points on their return trips from forward units. Transportation elements are tasked to support critical TECHINT missions when required.

EVACUATION CHANNELS

As stated in the introduction, US forces will usually evacuate CEM along the same channels as like US items. The system must, however, have the flexibility to evacuate high priority intelligence items directly from division collection points to the Theater CMEC and CONUS when required. This evacuation will be described in the logistical and intelligence appendixes to OPLANs. The routine evacuation channels are described below. Figures C-1 to C-4 provide examples of evacuation channels for CEM.

Abandoned or unserviceable US and captured foreign materiel are evacuated to each echelon's collection points for classification, segregation, and disposition. Collection points operate wherever needed throughout the theater of operations and should always be planned for ahead of time. In stability and support operations (SASO), it may take more time to evacuate larger items due to limited resources and environment.

In the Corps area, at least one materiel collection point is established. Other points are established in the TAACOM. Collection points in the communications zone (COMMZ) are generally operated by the collection and classification element of the general support maintenance battalion near the Class VII point.

In the division areas, DISCOM maintenance companies operate CEM points. During offensive operations, these points will be temporary until the Corps elements take control. CEM is handled and processed the same way as similar US items.

Salvage points, including Class VII, established by related supply units are located near unit maintenance collection points. These two points handle the collection, classification, inventory, and disposition of Classes II, VII, and IX materiel. The heavy division and Corps have the most

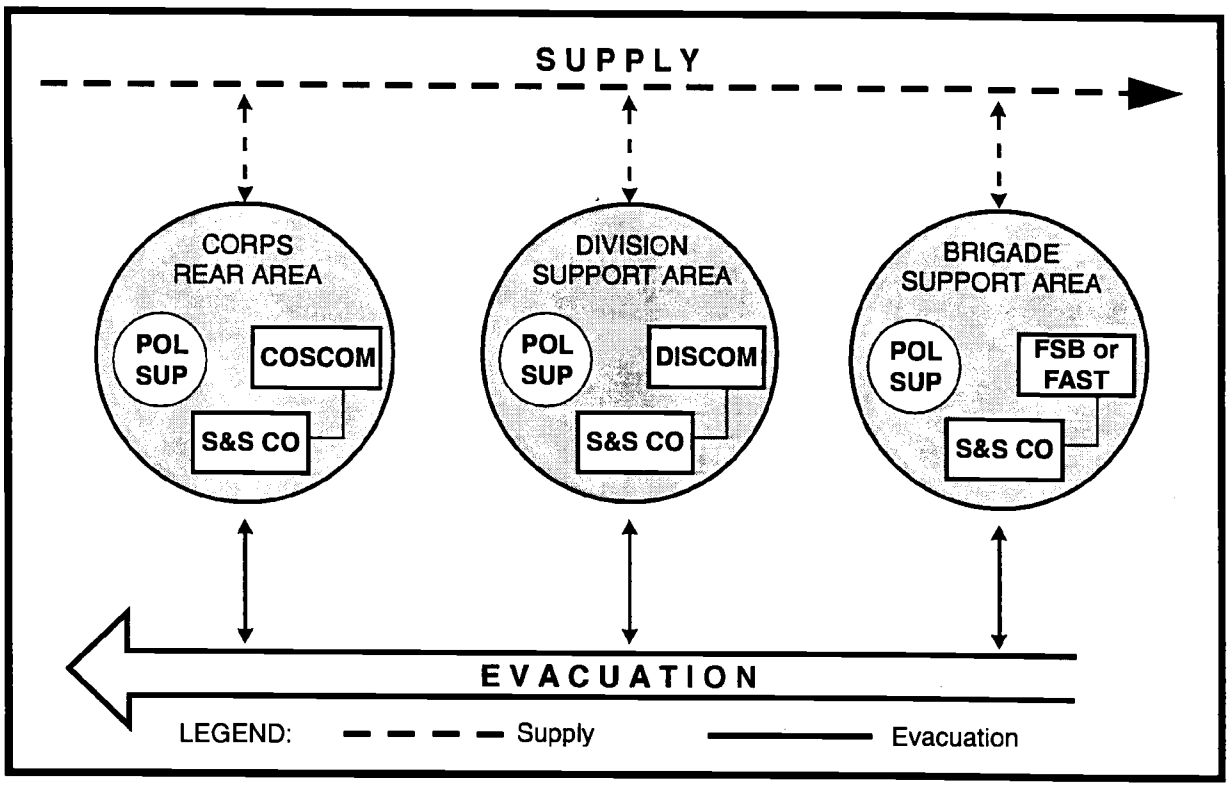


Figure C-1. Evacuation of captured petroleum, oils, and lubricants.

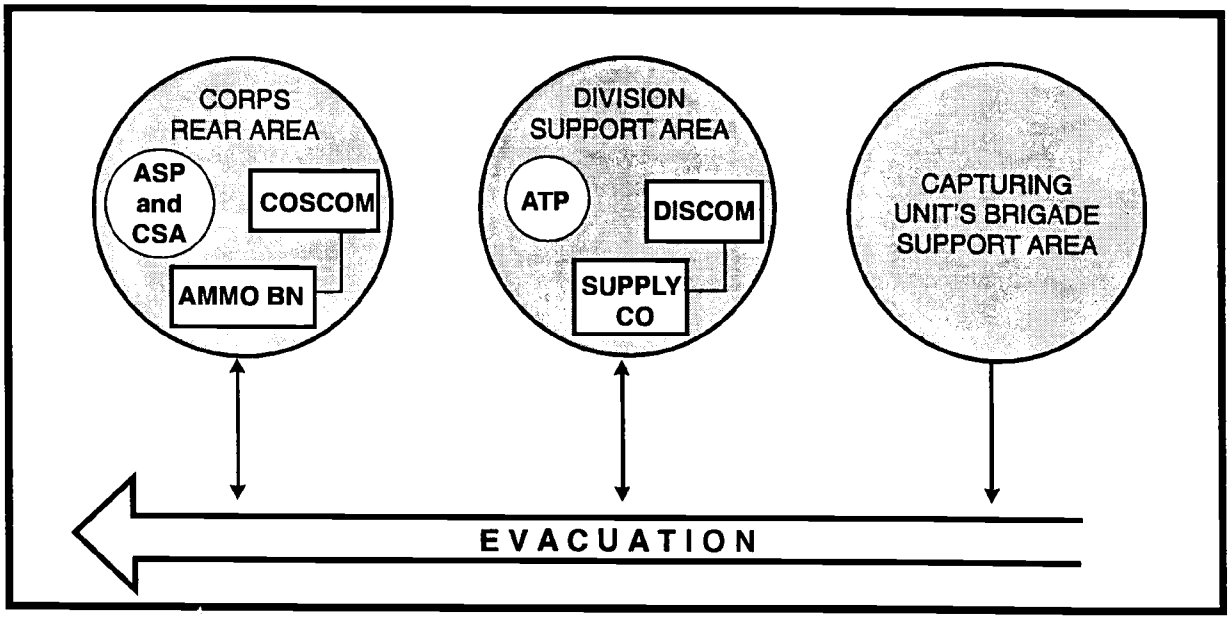

Figure C-2. Evacuation of captured ammunition and explosives.

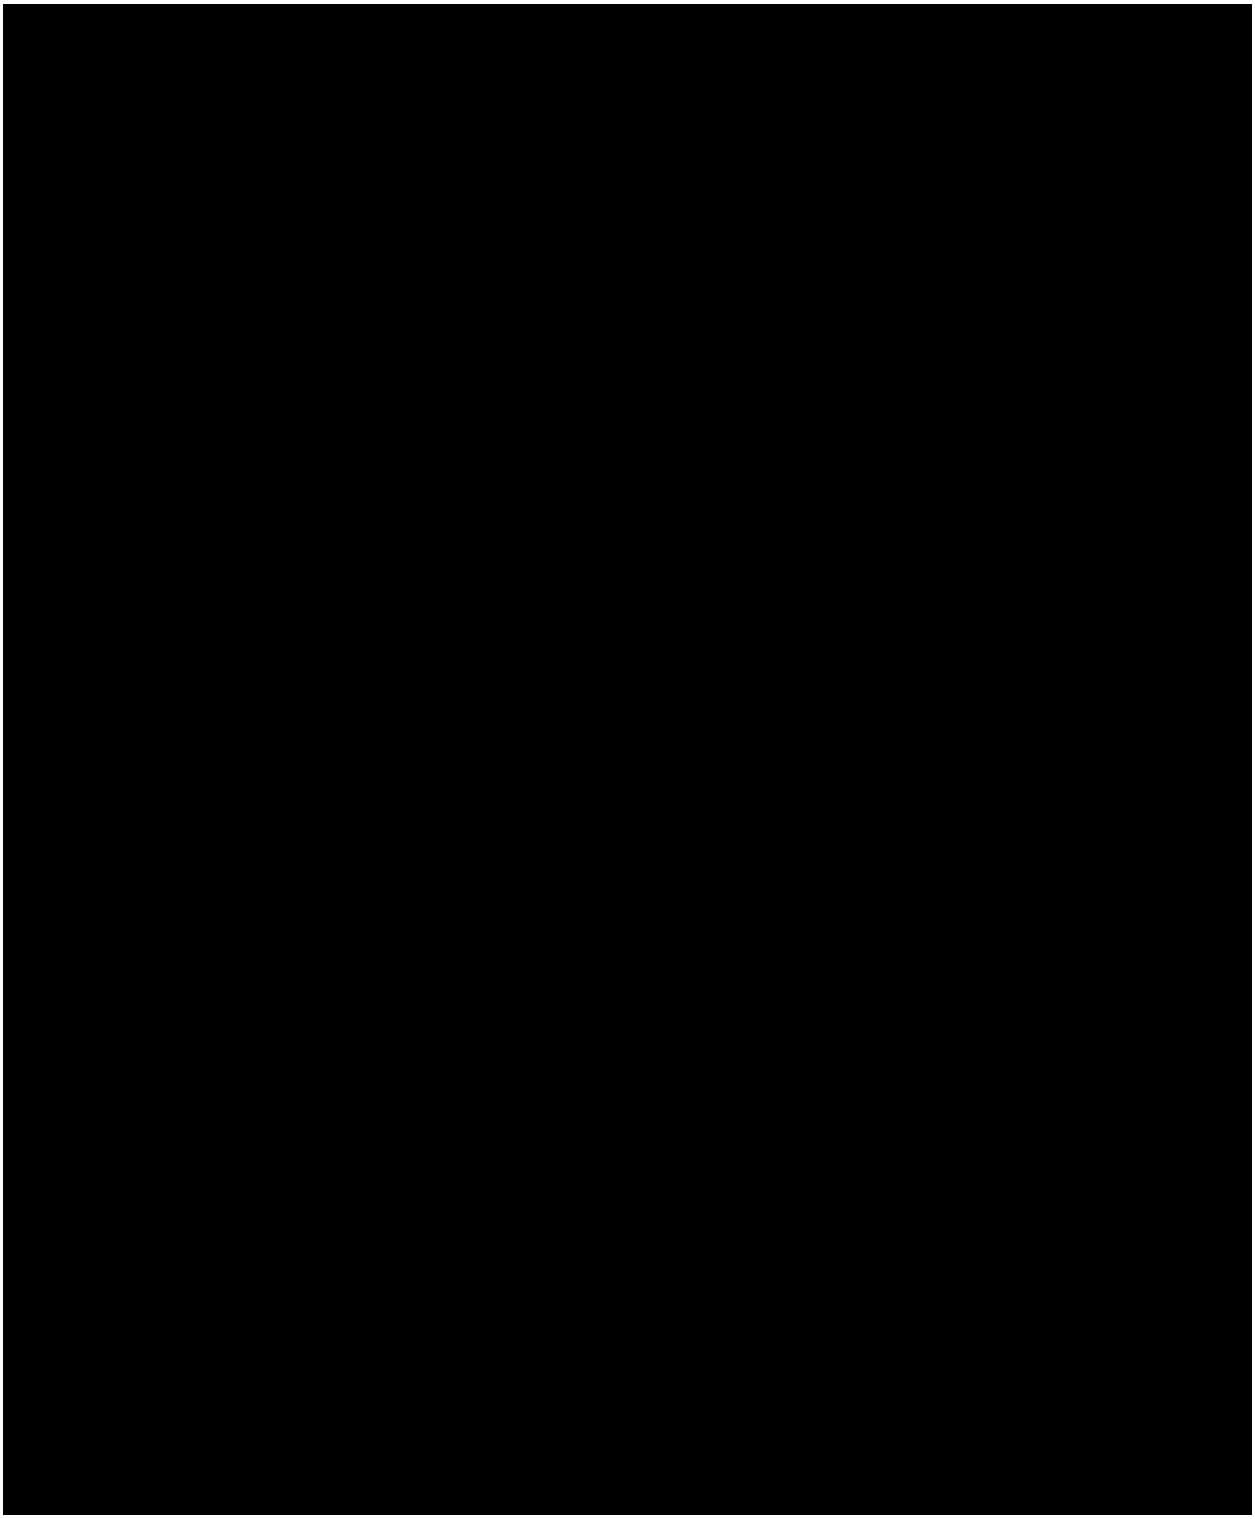

suitable assets for evacuation of large amounts of foreign materiel, such as tanks. The process is much the same in the light divisions. However, evacuation of the heavier items will be normally handled by COSCOM assets since the division lacks heavy transportation elements.

Petroleum, oils, and lubricants (POL) units establish their own collection sites to handle captured POL materiel. Supply units can also establish POL collection sites. Commanders will test and use captured POL at the lowest echelon possible. Samples will always be taken and sent to the Corps CMEC or TECHINT collection teams.

Class V ordnance, including missiles, is evacuated through conventional ammunition supply points (ASPs). Ammunition supply units will establish their own collection sites to handle captured Class V. It is critical that the CEM ASPs provide a detailed inventory of ammunition to logistical and intelligence channels. TECHINT elements must move assets to the CEM ASP to assist in identifying ammunition of intelligence value.

Class VIII medical items are evacuated through established medical supply points, the DMSO, and the MEDSOM elements. TECHINT elements must have full access to the medical materiel to identify items of medical value.

Captured aviation items, especially airframes, are evacuated to either the Class VIII CEM collection points, or the nearest aviation units airfield. All CEM, except NBC hazardous materiel and war trophies, that require evacuation to CONUS are eventually shipped to the Transportation Officer, Military Operations Division, Aberdeen Proving Ground, MD.

RESPONSIBILITIES

The personnel, activities, and elements responsible for the recovery and evacuation of CEM are usually the same as those responsible for handling like US items. A good example is the military police responsibilities.

Since military police are responsible for controlling prisoners, they have similar evacuation responsibilities for EPW and CEM. MI interrogators and TECHINT analysts exploit these sources of intelligence along the evacuation chain.

THE CAPTURING UNIT

The capturing unit always is responsible for reporting, safeguarding, and initiating accountability of CEM. The capturing unit reports the capture with a SALUTE report (see Figure E-1). It safeguards the materiel, within its mission parameters, until relieved or as long as possible. It initiates accountability by marking and tagging the item according to established procedures.

The capturing unit may be tasked to move CEM wanted for intelligence exploitation to a collection point. If the capturing unit is tasked with evacuation, it coordinates any assistance with the command responsible for direct support maintenance at their echelon.

The capturing unit may be tasked with the destruction of the item. This may require coordination with either EOD or NBC assets to do it safely. It is illegal to destroy captured enemy medical materiel. According to the Laws of Land Warfare, if friendly forces cannot use it for EPWs, refugees, and indigenous population, the medical materiel will remain in place and unharmed.

The capturing unit must report the discovery of unusual mechanisms used as booby traps through intelligence channels to the nearest TECHINT element and EOD by SALUTE report. Countermeasures must be coordinated with EOD personnel. EOD personnel are responsible for the final disposition of explosive components or hazardous materials associated with such devices and recovered ammunition.

EXPLOSIVE ORDNANCE DISPOSAL

As discussed, TECHINT units have a profound interest in foreign explosive ordnance. The assistance of EOD personnel in the examination, movement, and evacuation of explosive ordnance cannot be overemphasized. All items of foreign ordnance should first be rendered safe by EOD personnel. If this is not feasible, the item should be rendered safe in place by any destructive method that minimizes damage to the item.

Collection of TECHINT data may require dismantling of ordnance and stripping fuses and other dangerous components. These operations will be performed only by experienced personnel. Dismantling and stripping are conducted only in response to a specific requirement for such action. The request must be placed through TECHINT and EOD staffs. Only

trained weapons and munitions specialists should analyze or test captured mines and booby traps.

DANGER
Exercise extreme caution when encountering taut wire, pull releases, or similar devices due to the possibility of immediate death or permanent injury.

NUCLEAR, BIOLOGICAL, AND CHEMICAL

All CB hazardous items are handled and shipped in accordance with command SOPs, national policy, and theater TECHINT plan. Evacuation is best handled after coordination with either an NBC reconnaissance team, NBC qualified TECHINT team, or a task-organized medical element. NBC samples, after theater tactical exploitation, will be shipped to CONUS laboratories.

TECHINT ELEMENTS ECB, EAC, AND THE CMEC

When evacuation is either unknown or is delayed, TECHINT personnel will be tasked to perform onsite analysis. This can provide immediate tactical information and countermeasures vital to the combat force commander. Onsite analysis also ensures the recovery of intact components which become useless once wires are clipped and subcomponents have been disturbed. This type of analysis is limited by the battlefield situation and available assets.

During onsite analysis, TECHINT teams look for—

- Equipment operational characteristics, performance, capabilities, and vulnerabilities.
- New weapons and devices.
- Modifications.
- Possible countermeasures.
- Identification and proper handling of radioactive materiel.
- Specific orientation and siting of equipment.
- Recovery and evacuation of explosive ordnance and NBC munitions.

At times, a large number of like items will be acquired. The TECHINT teams or elements must have the opportunity to examine the materiel

thoroughly. They will be especially interested in any modifications done to the equipment.

TECHINT teams may also be tasked to supervise the materiel handling and evacuation onsite. The Corps TECHINT LNE or theater TECHINT elements will coordinate with appropriate staffs to evaluate the need to use TECHINT personnel to—

- Supervise the evacuation.
- Arrange necessary technical escorts to the Corps CMEC (Forward), CMEC, or CONUS.

TECHINT elements are capable of coordinating the handling and shipping with necessary medical, intelligence, NBC, and strategic level elements for captured CB materiel.

MARKING AND TAGGING

Labeling CEM properly is vital to the timely exploitation of the item. It speeds up the often slow process of producing effective countermeasures for the soldier in combat. Proper labeling provides the analyst information necessary for the item's timely exploitation. It also allows interrogators and TECHINT elements to match up knowledgeable prisoners with the CEM from which they became separated in the evacuation process.

RESPONSIBILITIES:

The capturing unit is responsible for properly marking and tagging CEM. The responsibilities must be clearly established by command SOP. The equipment and document tags accompany the materiel to its final destination. Article 103 of the Uniform Code of Military Justice is printed on the reverse side of the tag to prevent indiscriminate tampering.

As part of core training, all personnel should be instructed on how to tag CEM. They should know the consequences when personnel and equipment are not properly tagged. Training should stress protecting and preserving the original markings on materiel at the time of capture. Weather-resistant capture tags are used. They are normally produced within the theater. They are securely attached to the item itself and to the shipping container. If weather-resistant tags are not available, use any material (for example, rations packing) on which pertinent capture data can be recorded.

There are two procedures for marking and tagging CEM. The procedure used depends on whether or not the captured item is associated with a

captured person.

CEM WITH EPWs:

For CEM with personnel, tag the captured person and any associated CEM with the three-part tag (Form PE 96C-18). An example of this tag is at Figure C-5.

CEM BY ITSELF:

For CEM by itself, tag the piece of equipment and associated document with the tag shown at Figure C-6. Be careful to use this tag to label ONLY items captured with or known to be associated with a particular EPW. In addition, label all documents believed to be of a technical nature (such as operator manuals) with the flag word “TECHDOC." An example is shown in Figure C-7.

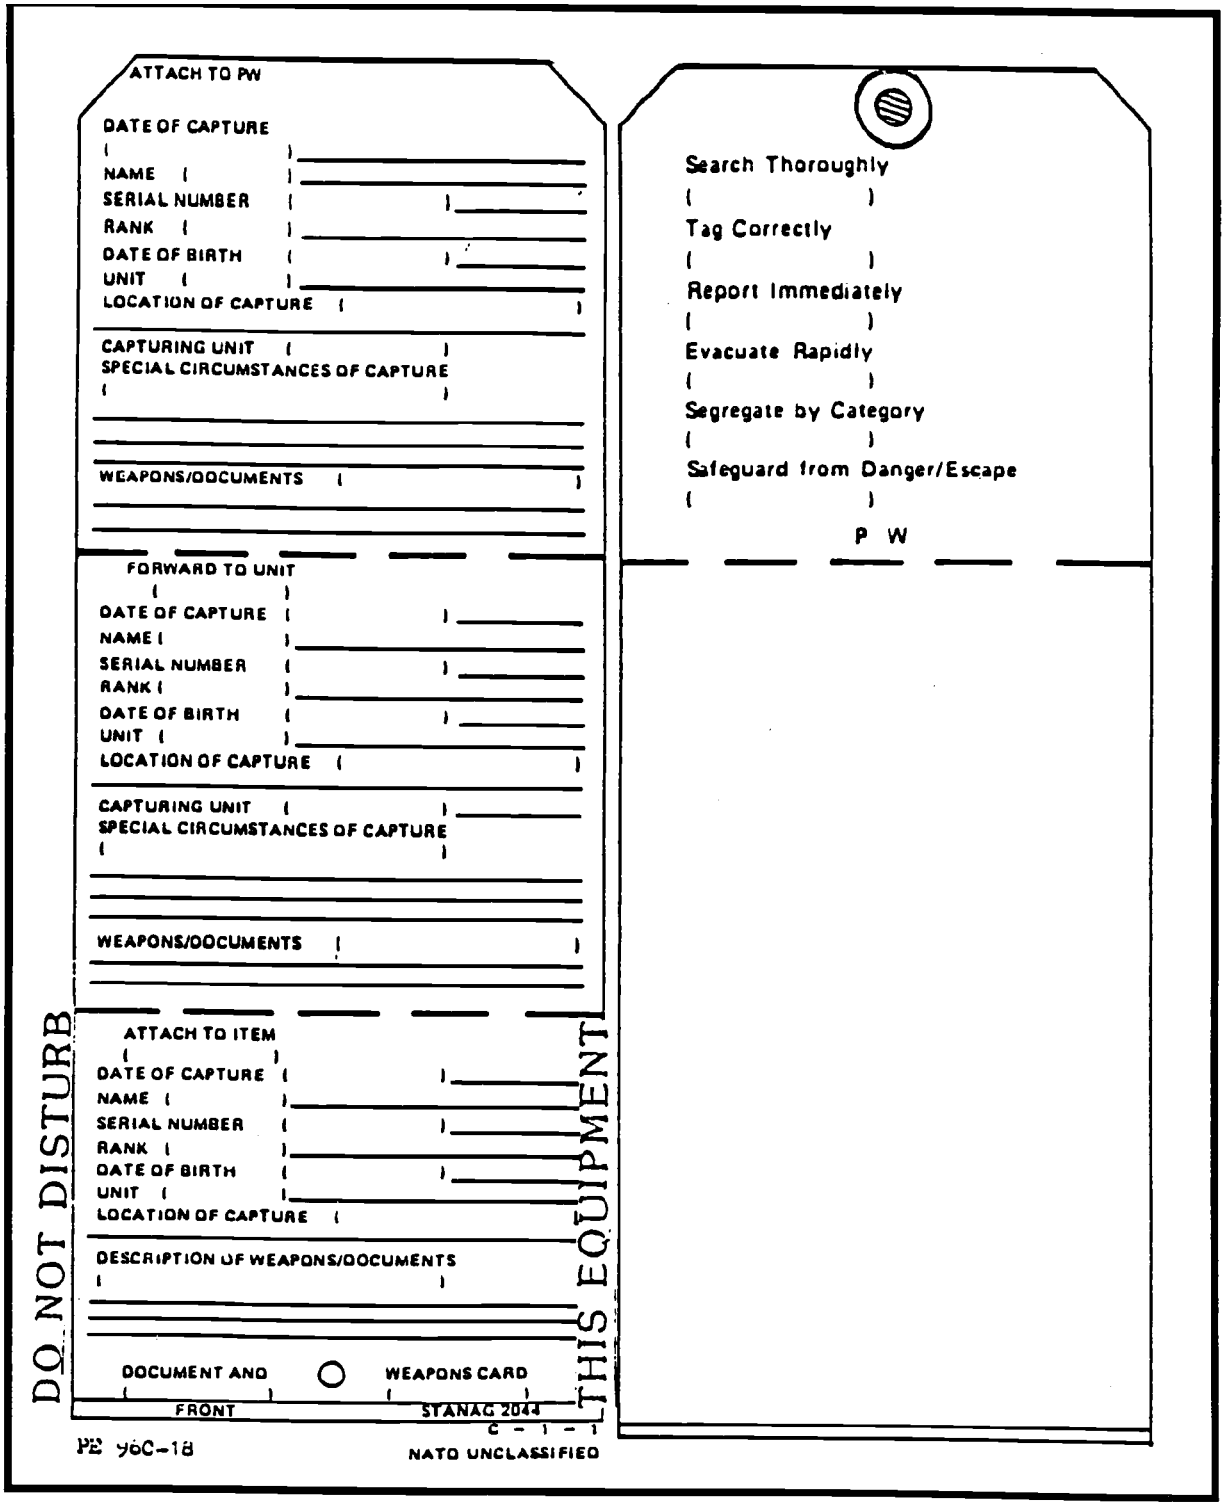

Figure C-5. Front and reverse sides of an EPW tag.

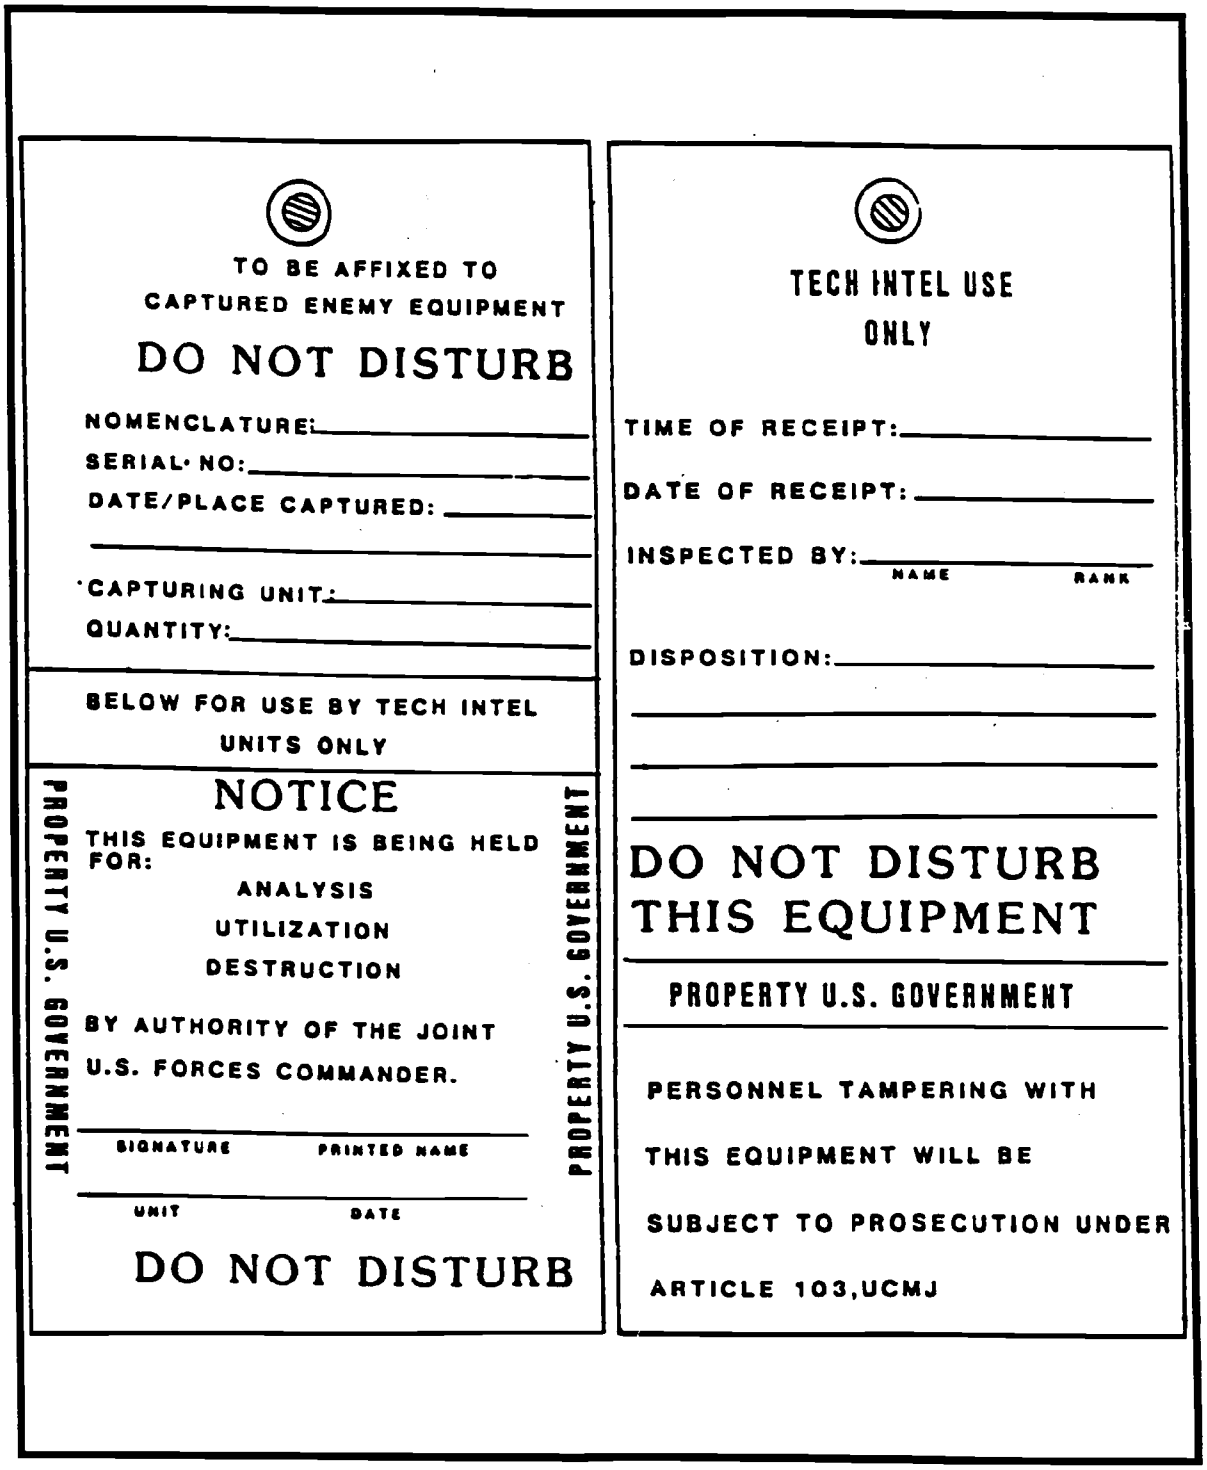

Figure C-6. Front and reverse sides of a CEE tag.

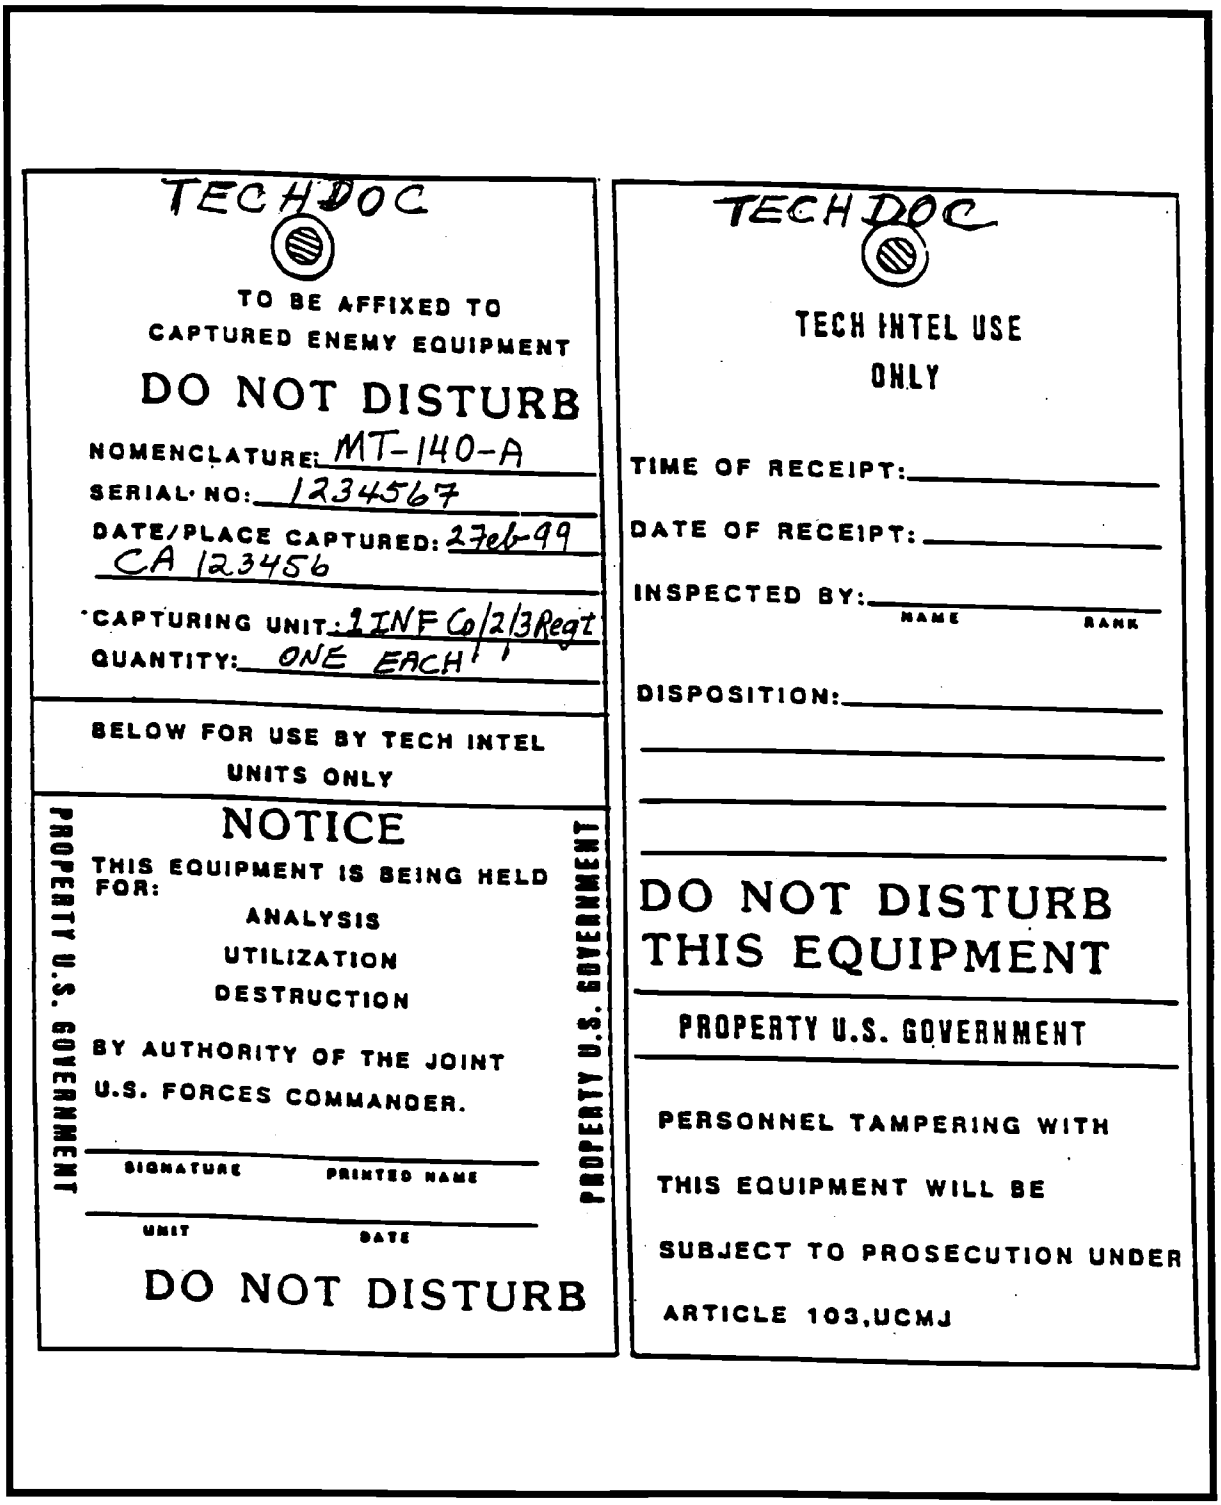

Figure C-7. Example of a CEE tag flagged for TECHDOCs.

SECURITY AND ESCORT

Many items of foreign materiel acquired by US forces and determined to be of TECHINT value require safeguarding in storage as well as during evacuation. Such items may be sensitive due to their criticality or because of the US classification assigned. At all stages during the exploitation process, CEM will be placed under guard to prevent looting, misuse, or destruction.

Initially, the capturing unit is responsible for safeguarding materiel, based on instruction from the next higher headquarters. When foreign materiel is sensitive or of special value, military police elements normally provide physical security during its evacuation.

RECOVERY AND EVACUATION OF TECHNICAL DOCUMENTS

Technical publications and manuscripts of concern to TECHINT relate to the technical design or operation of the materiel. Such documents may be acquired from the materiel to which they refer. Therefore, it is essential that TECHINT personnel coordinate with interrogation elements to exchange information about related documents.

CEM BY ITSELF:

All enemy documents captured on the battlefield are sent immediately to the first intelligence staff officer in the chain. The S2/G2 routes all CEDs to the nearest interrogation element for tactical exploitation. Interrogators screen the documents for immediate information and forward them to higher command, as required.

In any case, all known or suspected technical documents are marked "TECHDOC" and treated with highest priority and forwarded through intelligence channels to the higher command until their value has been determined.

CEM ASSOCIATED WITH EPWs:

Documents obtained through liaison with interrogation elements should be accompanied by pertinent interrogation reports. These reports can be in—

- SALUTE reports.
- Tactical interrogation reports.

- Special interrogation reports.
- Intelligence information reports.
- Biographic reports in accordance with DIAM 58-13.
- Knowledgeability briefs.

CRYPTOGRAPHIC AND OTHER ELECTRONIC EQUIPMENT AND DOCUMENTS

TECHINT units use special procedures for handling captured C-E equipment and documents. These items are tagged and evacuated to the nearest target exploitation (TAREX) element as soon as possible after the initial tactical exploitation.

WAR TROPHIES

Foreign equipment is frequently a target of souvenir hunters. An effective war trophy policy must be established to ensure that these items are not retained by the capturing unit.

FOREIGN MATERIEL NUMBERING SYSTEM

It is the responsibility of the COSCOM and Theater support command to tag all CEE that is sent to them in accordance with the foreign materiel numbering system. All inventories of CEE will use this system to keep track of materiel.

THIS APPENDIX COMPLIES WITH STANAG 2044 AND IMPLEMENTS STANAG 2084.

Appendix D

INTELLIGENCE ANNEX WITH TECHINT INPUT

INTRODUCTION

This appendix provides examples of TECHINT input to an intelligence annex and TECHINT-related tabs to that annex. The TECHINT appendix is used—

- As the primary example for the J4/G4 appendix on captured weapons.
- As the example for the J1/G1 appendix on equipment taken from EPWs. (See Figures C-1 through C-3 for CEE and EPW tags.)

THEATER ARMY INTELLIGENCE ANNEX:

Figure D-1 shows input for TECHINT operations. This example is tailored for a Theater Army headquarters. All headquarters, however, should include TECHINT operations input.

1. SUMMARY OF ENEMY SITUATION.

2. INTELLIGENCE REQUIREMENTS.

a. PIR:
(1) Does the enemy have significant quantities of night vision devices?
(2) Is there unusual or unexplained damage to US equipment and materiel?
(3) Has there been unexpected defensive and/or offensive capabilities of enemy equipment?

b. IR:
(1) What are the capabilities and/or limitations of the AT-5 ATGM?

3. INTELLIGENCE ACQUISITION TASKS.

Figure D-1. Example of an extract from a Theater Army Intelligence Annex.

a. General: Capture of any enemy materiel will be immediately reported through intelligence channels in accordance with priorities described below.

(1) 15th Corps. Priority of collection on foreign equipment is T-64B, AT-5, and SA-13.

(2) 25th Corps. Priority of collection on foreign equipment is BTR-70, BMP-l, and individual protective vest (body armor).

(3) 23d MI Brigade (EAC).

(a) 1st Battalion.

(b) 2d Battalion.

(c) 3d Battalion.

1 One TECHINT collection team and TECHINT LNE to operate within each corps area, attached to each corps MI brigade (command less OPCON).

2 Screening and exploitation of captured IEW priorities described in FM 34-54, Appendix B.

3 Fully integrate TECHINT operations and teams with IEW and EPW operations.

4. MEASURES FOR HANDLING PERSONNEL, DOCUMENTS, AND MATERIEL.

a. Personnel.

b. Documents.

c. Materiel.

(1) All materiel will be reported in accordance with procedures and priorities described in Appendix _, TECHINT.

(2) All materiel will be evacuated to the nearest collection point and held for TECHINT screening in accordance with Appendix _, TECHINT.

(3) Items designated by TECHINT personnel as possessing intelligence value will be evacuated to destinations designated by TECHINT personnel in accordance with priorities described in Appendix _, TECHINT.

Figure D-1. Example of an extract from a Theater Army Intelligence Annex (continued).

(4) No materiel will be diverted for other uses until screened and released by TECHINT personnel.

5. REPORTS AND DISTRIBUTION. All equipment-related intelligence, SALUTE, and EPW reports will include the J2/G2 and CMEC as an addressee.

Figure D-1. Example of an extract from a Theater Army Intelligence Annex (continued).

(TAB B) JOINT THEATER TECHNICAL INTELLIGENCE APPENDIX:

Figure D-2 is an example of a Joint Theater TECHINT appendix. It shows how CEM must be handled, reported, and disposed of.

Appendix___, TECHINT, to Annex___, Intelligence, to OPLAN/OPORD___.

REFERENCES:

a. OPLAN _____

b. FM 34-54.

c. FM 3-19-1.

d. Chemical and Biological Sampling, Transport, and Evaluation Management Procedures, dated February 1986.

1. PURPOSE: This appendix establishes policy and prescribes responsibilities and procedures for the proper handling, reporting, intelligence assessment, and disposition of CEM. Additionally, it establishes the procedures for the safe and expedient collection of suspected CB agents to the laboratory for processing, analysis, and identification.

2. POLICY:

a. The J2 controls and directs the theater captured materiel exploitation program. The CMEC OPCON to the J2 carries out exploitation activities.

b. The CMEC will be formed from elements of the 203d MI Battalion (TECHINT), _____ MI Brigade.

c. The _____ J2 exercises staff responsibility over the intelligence exploitation of CEM throughout the area of operations and establishes requirements for evacuation of specific items to CONUS for further exploitation. An LNE from the JCMEC will be located in the J2.

d. Commander, 203d MI Battalion (TECHINT)—

(1) Establishes the CMEC and attaches a TECHINT team to each Corps; positions an LNE with the J2, each Corps G2, the theater MI Brigade, and theater interrogation.

(2) In coordination with the Theater/Army Surgeon General, advises the J2/G2 on all matters of CB sampling.

Figure D-2. Example of a Joint Theater TECHINT Appendix.

(3) Recommends a theater souvenir and war trophy policy in accordance with FM 34-54, Appendix C.

e. The J3—

(1) In coordination with the J2, approves requests and assigns priorities for issue of CEM to US units engaged in special missions or training based on the following prioritized uses of captured materiel:

(a) Intelligence.

(b) Special warfare.

(c) Special Operation Forces.

(d) Issue to friendly forces.

(e) Internal defense.

(f) Substitutes or supplements to US equipment.

(g) Distribution to friendly foreign units or groups.

(2) Coordinates provisions of EOD support as required in the exploitation of CEM in accordance with AR 75-15 and to fill requirements stated by the J2.

f. The J4 exercises staff supervision over the evacuation and movement of CEM of intelligence value in the theater to the JCMEC, and coordinates evacuation of high priority items back to CONUS.

g. The Staff Judge Advocate provides legal guidance concerning the disposition of certain categories of enemy materiel, structures, and facilities.

h. See Tab D of this appendix for CB sampling responsibilities.

3. RESPONSIBILITIES:

a. The CMEC is charged with the conduct and coordination of assessment of CEM within the command. Support in the assessment of enemy naval and aerodynamic systems and materiel will be provided by intelligence personnel from the Navy and Air Force components attached to the CMEC. The scope of responsibilities include:

(1) Assign an LNE to the J2, G2, and the theater interrogation facility.

Figure D-2. Example of a Joint Theater TECHINT Appendix (continued) .

(2) Deploy TECHINT collection teams forward to each deployed Corps to conduct preliminary screening of evacuated materiel and to respond to targets of opportunity which cannot be processed in a normal manner.

(3) Receive and process validated intelligence requirements for items of enemy materiel.

(4) Participate in the technical interrogation of EPWs and assist in screening CEDs.

(5) Examine and evaluate TECHINT reporting and classification of CEM.

(6) Participate with TAREX elements to fully integrate the exploitation of specified C-E items.

(7) Participate with medical, NBC, and Special Operations units for coordinating the delivery of CB samples through MI channels to the TAML.

b. Subordinate Commands:

(1) Each Corps will—

(a) Designate and operate collection points. Report locations of collection points where CEM will be stored and amounts and types stored at each location. Forward reports to Cdr, CMEC, with an information copy to the J2/G2 and J4/G4s. The collection point will receive, store and, only upon direction, dispose or issue CEM.

(b) Designate and operate ammunition storage areas for the storage of captured ammunition and explosive items, as required. Store captured chemical munitions similarly to like US chemical munitions. Report locations of ammunition storage areas and amounts and types stored to Cdr, CMEC, with an information copy to J2/G2 and J4/G4.

(c) Provide necessary logistics support, as required, to evacuate CEM and CB samples needed for intelligence operations, or other purposes, from collection points to the CMEC.

(d) Ensure all CEM is promptly tagged.

(e) Provide logistics and administrative support for all TECHINT assets operating within their areas.

(2) NBC reconnaissance units, Special Operations units, and medical units are responsible for the transfer of CB samples to TEUs or TECHINT collection teams at Corps, or directly to the TAML.

Figure D-2. Example of a Joint Theater TECHINT Appendix (continued) .

4. PROCEDURES:

a. Procedures for handling and processing CEM.

(1) The recovery and evacuation of CEM is a command responsibility at all levels. The prescribed method of evacuation is through normal logistics channels and in accordance with priorities established in Tab A and Tab B to this Appendix.

(2) Enemy materiel captured by US military personnel is the property of the United States and must be protected from pilferage, cannibalizing, and souvenir hunters. Commanders at all levels will provide adequate security for CEM until it has been screened by TECHINT personnel.

(3) Specific intelligence collection requirements and Top Ten End Item requirements items of enemy materiel for which the tactical commander and intelligence agencies have a need are listed at Tab A and Tab B to this Appendix. These Tabs will be published upon execution of the OPLAN.

(a) When items listed in Tab A and Tab B or any of their updates are captured or otherwise obtained, commanders will ensure that the acquisition is reported through intelligence channels to the Corps TECHINT LNE to Cdr, CMEC, with an information copy to J2/G2.

(b) Report as in (a) above (at a PRIORITY precedence) the capture of standard types of foreign materiel that have been apparently modified in a major way or are having a greater impact on combat operations than expected. These items will be evacuated to COSCOM collection points by available backhaul capabilities on a PRIORITY basis. Equipment will be held pending further disposition instructions from the J2 through the Corps TECHINT LNE.

(c) The capture of items listed in Tab A and Tab B will be reported by IMMEDIATE precedence through intelligence channels and expeditiously evacuated to at least the supporting collection point to await further disposition instructions from J2.

(d) Report as in (a) above (at a ROUTINE precedence) all CEM. These items will be evacuated to collection points by available backhaul capabilities on a space-available basis. They will be held at the collection point until screened by TECHINT personnel. Disposition will be per paragraph 4d below.

(e) The J2, in coordination with the J4, is the focal point for evacuation of key items of intelligence interest to CONUS for national exploitation.

Figure D-2. Example of a Joint Theater TECHINT Appendix (continued) .

(4) The assessment of CEM below division and separate brigade levels will be limited. Their primary responsibility is the recovery, reporting the capture, and initial evacuation of enemy materiel from the capture location to the nearest collection point. Exception is for medical supplies which will be handled through medical supply channels. Significant items of CEM which cannot be evacuated, either because of the tactical situation or due to their size, will be left in place and reported immediately.

(5) Assessment of CEM at division and separate brigade level is performed by intelligence and operations personnel to the extent necessary to determine the immediate tactical significance of the materiel. Assessment at this level does not replace the need for detailed evaluation and analysis of CEM by technical specialists from the JCMEC. For this reason, the prompt evacuation of significant items of CEM must not be delayed.

(6) Screening and preliminary field assessment of CEM is performed by JCMEC TECHINT collection teams. These teams will operate in the Corps areas and are attached (command less OPCON) to the Corps MI Brigade. When required, these teams can also provide assistance to capturing units. Assessment functions are normally carried out at the Corps support area collection points. Items of intelligence interest or items needed to fill other requirements by the JCMEC are selected for evacuation. Selected items will be evacuated to the JCMEC, or a designated location, by collection point personnel through logistics channels.

(7) Selected CEM evacuated to the CMEC is subjected to detailed examination and evaluation to—

(a) Determine enemy materiel threats, performance capabilities, and limitations.

(b) Produce information from which military countermeasures may be developed.

(c) Provide inputs continuously to the national and integrated S&TI Program in accordance with DIA and Theater policies.

(d) Provide intelligence that can be of timely use to the tactical commander.

b. Materiel Requiring Special Handling.

(1) C-E Equipment. All CEM in this category must be evacuated immediately with their dial settings, frequencies, and so forth, and recorded and sent to the supporting EW unit by the quickest and most secure means possible. All such materiel will be evacuated to Corps support area collection points for screening by TECHINT and other specialized personnel.

Figure D-2. Example of a Joint Theater TECHINT Appendix (continued) .

(2) Ammunition and Explosives. The complete recovery and expeditious evacuation of enemy ammunition and components is essential to the identification of known or new enemy weapons systems and the threat posed by each. EOD teams are responsible for preparing PRETECHREPs on first-time-seen enemy ammunition or explosives. If there are no TECHINT personnel to assist in the area, EOD teams will also be responsible for preparing COMTECHREPs.

(3) Medical Materiel. Medical materiel normally will not be destroyed. It will be left in place if it cannot be evacuated. It will be handled in accordance with normal Class VIII procedures.

(4) Significant Items: All intelligence requirements specified in Tab A and Tab B will be afforded special handling as described in paragraph 4a above.

(5) Technical Documents: Captured or recovered technical documents consist of firing tables, logbooks, packing slips, and other documentation. If the tactical situation does not permit the equipment to be evacuated, the documents will be forwarded to the JCMEC and will include a description of the equipment.

(6) CB Samples. See Tab D to this appendix.

c. Requirements.

(1) DIA provides national intelligence requirements for CEM to the Theater. In-theater intelligence requirements for enemy materiel are submitted through J2 and G2.

(2) In-theater operational and training requirements for other than Army subordinate units are submitted through J3 to the J2 for review, approval, and assignment of priority.

(3) The intelligence requirements are published in Tab A and Tab B.

d. Disposition.

(1) Items required in support of operational requirements or for distribution to host-country forces will be separately designated by the J3. Tab C to this Appendix contains such equipment.

(2) Items determined by the J2 to have no intelligence significance and by the J3 to have no operational need will then be identified and reported through logistics channels to the J4. Items will be retained within designated collection points for further disposition by the J4. No items will be released for war trophies until released by J2.

Figure D-2. Example of a Joint Theater TECHINT Appendix (continued) .

e. Destruction. The destruction of CEM, excluding medical items, will be accomplished only in the event that recapture is imminent, due to its location, or in those cases where materiel is declared by EOD or TECHINT personnel to be hazardous to the safety of troops. In the event destruction of materiel is necessary, all factory markings should be carefully recorded and photographs taken, if possible, before the materiel is destroyed. Medical items normally will not be destroyed, but left in place.

OFFICIAL:

TABS:
A = Top Ten Priority Items (TBP)
B = General Collection Requirements (TBP)
C = Equipment Releasable to Allies (TBP)
D = Chemical, Biological, and Biomedical Sampling

Figure D-2. Example of a Joint Theater TECHINT Appendix (continued) .

(TAB D) CHEMICAL, BIOLOGICAL, AND BIOLOGICAL SAMPLING PROCEDURES:

Figure D-3 is an example of a Tab D to a TECHINT Appendix of a Theater Army Intelligence Annex. It shows disposition instructions for CB samples.

1. PURPOSE: To establish the procedures for the safe and expedient collection and evacuation of suspected CB agents to the laboratory for processing, analysis, and identification.

2. RESPONSIBILITY:

a. The Cdr, JCMEC, with the Army and Theater Surgeon General, are responsible for advising the J2/G2 and J3/G3 on all matters of CB samplings.

b. Corps G2, SOCCENT J2, MARCENT G2, Navy intelligence, and Air Force intelligence will be responsible for transferring samples to MI channels via TEU teams or TECHINT collection teams.

c. Medical personnel will coordinate with combat units and Graves Registration Service units through local medical units and hospitals for obtaining biomedical samples, for the expedient transfer of personnel deceased as a result of a CB attack.

d. The Cdr, JCMEC, will be responsible for coordinating shipment of suspected biological samples to the TAML for preliminary analysis, and suspected chemical or biological-chemical mixed to CONUS-based laboratories.

e. The TEU is responsible for coordinating shipment to the US Army Chemical Research Development and Engineering Center (ERDEC) at Aberdeen Proving Ground, MD, if it is a chemical sample; or to the US Army Research Institute of Infectious Diseases (USARIID) at Fort Detrick, MD, if it is a combination CB sample or if it is a suspected biological sample only.

3. SAMPLING RESPONSIBILITY: Samples suspected of containing CB agents are divided into environmental and biomedical samples on the basis of their origin. Both medical and nonmedical teams are responsible for collecting samples suspected of containing CB agents.

a. ENVIRONMENTAL SAMPLES. Environmental CB agent samples are collected in the field. They include samples like aerosols or vapors; liquids other than water, soil, vegetation; water; used chemical equipment; and ordnance. The acquisition of these samples is the responsibility of—

(1) NBC reconnaissance teams.

Figure D-3. Example of a TAB D to a TECHINT Appendix of a Theater Army Intelligence Annex.

(2) Technical escort field teams.

(3) TECHINT collection teams.

(4) Preventative medicine units (potable water sources only).

(5) Special operation teams.

b. BIOMEDICAL SAMPLES. Biomedical samples are derived primarily from acutely ill soldiers who exhibit symptoms of CB agent intoxication or from personnel who were killed in an attack. Collection of the biomedical samples will be the responsibility of personnel in—

(1) Battalion-level medical units.

(2) Division-level medical treatment facilities.

(3) Combat support hospitals.

(4) Evacuation hospitals.

(5) Theater medical hospitals.

(6) NBC reconnaissance teams (small animals only).

(7) Technical escort field teams.

(8) TECHINT collection teams.

4. SAMPLING: Sampling will be initiated if the following are observed:

a. Significant numbers of unexplained sickness or death of personnel or animals occur.

b. Ordnance (munitions) are found which contain known or suspected CB agents.

c. An attack is suspected or is known to have occurred but the causative agent cannot be identified.

d. The widespread outbreak of unusual mission-degrading behavior occurs.

e. Sampling of known identified agents to verify first use is required.

Figure D-3. Example of a TAB D to a TECHINT Appendix of a Theater Army Intelligence Annex (continued).

5. PROCEDURES:

a. Procedures for the collection, packaging, documentation, and transporting of CB samples to laboratories must be precise to ensure the credibility of the analysis conducted on the samples. Ensuring the credible analysis of suspected CB samples is critical for both battlefield commanders concerned with possible retaliation and contamination avoidance, and medical personnel concerned with prophylactic or post-contamination treatments.

b. When possible, a background sample from "clean" areas beyond the perimeter of the attack site should be obtained as baseline data for comparison; collection should be identified to sample collected data from contaminated areas and packaged separately.

c. The best biomedical sample is an acutely ill soldier or a cadaver which is sent back to CONUS immediately. A copy of the physical examination or an extract of significant findings will be enclosed with biomedical samples. Samples will be collected in triplicate, distributing two to CONUS and one to the TAML.

d. All samples will be forwarded from the TAML to either ERDEC or USAMRIID laboratories 12 to 24 hours after collection; delay beyond 24 hours rapidly degrades the intelligence value of the samples.

6. NOTIFICATION MESSAGE: A notification message will be sent from the TAML or TECHINT unit by PRIORITY precedence upon receipt and screening of samples to the Theater Surgeon General, J2, J3, and CDR, ERDEC APG MD//CBATEB//: The notification message will contain the following information:

a. The sample identification number and details which relate to the acquisition of the sample. This message will be confirmed to provide the following information:

(1) Background information.

(2) Physical description.

(3) Results of preliminary tests after sample collection.

(4) Where, when, and under what conditions the sample was acquired.

(5) Description of incident.

(6) Casualty symptoms (if applicable).

(7) Shipment information, such as—

Figure D-3. Example of a TAB D to a TECHINT Appendix of a Theater Army Intelligence Annex (continued).

(a) Date of shipment.

(b) Mode of transportation.

(c) Flight number and destination.

(d) Estimated time of arrival CONUS.

(e) Description of shipment (for example, size and weight).

(f) Names of escort personnel.

Figure D-3. Example of a TAB D to a TECHINT Appendix of a Theater Army Intelligence Annex (continued).

Appendix E

TECHNICAL INTELLIGENCE REPORTS

INTRODUCTION

This appendix describes the nine basic reports, which are listed below, that battlefield TECHINT analysts use.

- SALUTE report (Figure E-1).
- Preliminary Technical Report (PRETECHREP) (Figure E-2).
- Complementary Technical Intelligence Report (COMTECHREP) (Figures E-3, E-4, and E-5).
- Detailed Technical Report (DETECHREP).
- Technical Intelligence Update Report.
- Technical Intelligence Summary (TECHSUM).
- Technical Intelligence Report (TIR).
- Special technical reports. These reports are generated in response to requests for information. The formats vary by request and usually address a specific question or requirement from a TECHINT consumer.
- Other equipment information reports. These reports focus on aspects of equipment that do not necessarily relate to intelligence needs per se. For example, the Theater commander may have a war trophy policy that permits units to evacuate certain equipment to their home stations for static displays. These reports may include driver's instructions, handling considerations, render-safe procedures, and demilitarization standards for equipment.

The SALUTE report is an oral or written report prepared by the acquiring units or intermediate command echelons. It is used to report rapidly, by electrical or other means, the capture of foreign materiel. These reports are forwarded to either the TECHINT LNEs at Corps, other TECHINT LNEs, or directly to the JCMEC. As a result of this information, a TECHINT team could be dispatched or the CEM could be moved to the Corps CMEC or the theater JCMEC. Figure E-1 gives an example of a completed SALUTE report.

SALUTE REPORT

TO: G2 V Corps DTG: 230900Z Aug 98
FROM: G2 24th Inf Div (Mech) REPORT NO: 07-0623

1. SIZE: NA.

2. ACTIVITY: Capture of shoulder-fired laser target designator by 1/64th Armor Bn 2d Bde 24th Inf Div (Mech) **(include capturing unit)**.

3. LOCATION: Town of Al-Dahran (UTM EH556937) **(as a minimum always give grid coordinates)**.

4. UNIT: 3d Republican Guards Regiment **(include enemy unit if known).**

5. TIME: Item captured on 230230Z AUG 98 **(always use ZULU time)**.

6. EQUIPMENT: One laser target designator and sighting device **(give best possible description).**

Figure E-1. Example of a SALUTE report.

PRELIMINARY TECHNICAL REPORT

The PRETECHREP contains a general description of the CEE. It alerts the CMEC, other technical elements, and the tactical units to significant technical information of immediate tactical importance. It can also be used for reporting inventories at collection points through intelligence channels so that location, quantities, and type of equipment can be monitored. Figure E-2 shows an example of a PRETECHREP.

Corps TECHINT teams and possibly CMEC teams will prepare a PRETECHREP on all CEM after preliminary screening. This report is first transmitted by radio directly to the Corps TECHINT LNE, from the captured equipment site. It is then forwarded to the CMEC. The report will normally be treated as unclassified during this transmission.

The CMEC's technical analysts determine what is of importance from the report, and give the team instructions through the LNE on what items need more detailed reporting or evacuation. During this time the team will collect all documents off the CEE and will record—

(Classification)

PRETECHREP

A. Type of equipment and quantity.

B. Date and time of capture.

C. Location (map reference).

D. Capturing unit and circumstances of capture.

E. Enemy formation from which captured and origin.

F. Brief description with serial numbers and, if possible, manufacturer.

G. Technical characteristics with an immediate value, including information or any photographs available.

H. Time and origin of message.

I. Present location of CEE.

(Classification)

Figure E-2. Format for a PRETECHREP.

- All radio frequencies of communication equipment.
- All serial markings of important equipment.
- The battle damage done to the CEE.

These information requirements and actions will be taken at all CEE sites. The radio frequencies will be sent only by secured means.

COMPLEMENTARY TECHNICAL INTELLIGENCE REPORT

The COMTECHREP is categorized by Types A, B, or C, depending on what type of CEE is being reported. The COMTECHREP contains a more detailed description of the CEE than the PRETECHREP. It alerts the JCMEC, other technical elements, and the tactical units to significant detailed technical information of immediate tactical and technical importance.

Corps TECHINT teams, and possibly JCMEC teams, will prepare a COMTECHREP on all CEM that the JCMEC tells it to do. If the TECHINT collection team is out of contact with the JCMEC, it will follow the TECHINT collection plan and use its best judgment on reporting.

This report is first transmitted normally by secure computer data transmission over landline to the Corps TECHINT LNE from the team's base. If possible, it is transmitted from the CEE site over secure computer or radio data transmission via satellite. It is then transmitted to the JCMEC. The report normally will be treated as classified during this transmission.

All electronic images of the CEE and computer scanning of critical CED will be transmitted with the COMTECHREP. If data transmission is not on hand, the report will be transmitted by the nearest message center at no less than PRIORITY precedence.

COMPLEMENTARY INTELLIGENCE TECHNICAL REPORT - TYPE A

The COMTECHREP - Type A is provided to Air Force TECHINT personnel. Air Force teams usually are not on the scene of captured or downed enemy aircraft before destruction, recapture, or loss. Army TECHINT personnel usually are the first elements on the scene and will examine the CEM and submit a COMTECHREP - Type A. This report often constitutes the only information that can be provided to Air Force TECHINT. If naval CEM is acquired, the Type A report format can be modified for reporting such acquisition. Figure E-3 shows an example of a COMTECHREP - Type A.

(Classification)

COMTECHREP - TYPE A

The COMTECHREP - Type A is used to report information about aircraft. The JCMEC normally will require this report to be done right after the PRETECHREP on the aircraft.

A. Type of Aircraft, fixed wing (examples):
   (1) Air-superiority (F-15C, SU-27B)
   (2) Multi-role fighter (F-l6, MiG-29C)

(Classification)

Figure E-3. Format for a COMTECHREP - Type A.

(Classification)

(3) Fighter-bomber (F-111, YAK-141)
(4) Close Air Support/Ground Attack (A-10, SU-25, SU-22)
(5) Bomber (B-2, TU-160)
(6) Observation (OV-10)
(7) Transport (C-130, IL-76)
(8) Airborne Early Warning (AWACS, Israeli PHZ)
(9) Electronic Warfare/Suppression of Enemy Air Defense (EA-63, F-4G)
(10) Special Mission (for example, Intelligence Collection)

B. General Aircraft Configuration:
(1) Overall length
(2) Wingspan
(3) Wing sweep angle
(4) Variable geometry wings
(5) Number of vertical stabilizers and orientation
(6) Number of seats and orientation
(7) Number of engines
(8) Intake type and location
(9) Landing gear type and orientation
(10) Distinct control surfaces present (flaperons, elevons)
(11) Other distinguishing features (wing fences, wingtip winglets, antennas, canards)

C. Identifying Marks:
(1) Fin flashes
(2) Paint scheme
(3) Individual or squadron markings

D. Overall Condition:
(1) Describe extent of damage and salvageable parts
(2) Assess cause of crash, if possible
(3) Did Aircrew survive

E. Cockpit Avionics (not all equipment is present in every aircraft):
(1) Type (brand and model) of airborne intercept, bombing and navigation, weather radars
(2) Type of communications gear, frequency settings if possible
(3) IFF or Transponder type, settings
(4) Type EA equipment
(5) Type of RWR gear
(6) Type of weapon guidance gear (laser designation equipment, TV guidance equipment)

(Classification)

Figure E-3. Format for a COMTECHREP-Type A (continued).

(Classification)

(7) Type of IRSTS if present
(8) Are the following flight controls present: HUD, fly-by-wire controls, MFD, HOTAS (9) Type of chaff or flare dispenser system

F. Armament:
(1) Number of cannons present, caliber, and location
(2) Bombs or rockets present
(3) Air-to-air missiles present
(4) Air-to-surface missiles present
(5) Number of launch rails or weapon mounts present and location

G. General remarks and special points or unusual features not mentioned.

H. Photos of at least:
(1) Airframe
(2) Engine
(3) All other items that could be of importance

I. Designation of TECHINT collection team conducting exploitation:

J. Time and origin of message:

(Classification)

Figure E-3. Format for a COMTECHREP - Type A (continued).

COMPLEMENTARY TECHNICAL INTELLIGENCE REPORT - TYPE B

The COMTECHREP - Type B is used to report information about explosive ordnance. TECHINT teams prepare these reports, normally done by the EOD member of the team. EOD companies will also prepare them in absence of TECHINT personnel or when required by higher headquarters. This report must be as complete and detailed as possible. EOD personnel prepare and send this report by the fastest means through an EOD control unit. The JCMEC coordinates with EOD battalions to receive copies of these reports as soon as possible.

NOTE: Initial overall classification of EOD Reports. Non-nuclear (COMTECHREP B) will be in accordance with OPNAVINST S5513.3B-24.1.

The initial classification of the COMTECHREP B with RSP is Confidential and will not be released to non-US personnel without the written consent of Commanding Officer, NAVEODTECHDIV. The release of RSP to non-EOD qualified personnel is forbidden.

A complete and accurate report is essential; lives of other EOD personnel rely on this report, strive for the most complete report possible. However, when a detailed report might result in serious delay and the items are of extreme significance, complete as much of the report as possible. Items of EOD interest will at a minimum be photographed (with electronic imaging systems if available), X-rays (digital) and have detailed drawings with measurements (metric). Figure E-4 shows an example of a COMTECHREP - TYPE B.

The unit completing the report will distribute copies of the COMTECHREP - TYPE B (EOD Report) to all deployed US EOD units and provide copies to:

Commander
USATECHDET
2008 Stump Neck Road

COMTECHREP-TYPE B (EOD Report)

Section I. (U) DESCRIPTIVE INFORMATION

1. (U) IDENTIFICATION. See Figure __ for physical appearance and dimensions.
NOTE: This will be an external view (when possible) and not show internal components.

a. (U) Designation. Ordnance designation (if known) with transliteration of foreign alphabet.
Example: M45.

b. (U) Type. Used to summarize the key functional aspects of the items.
Example: This is a High Explosive Rocket Assist (HERA) projectile.

Figure E-4. Format for a COMTECHREP - TYPE B.

c. (U) Painting and Markings. Record all paintings, surface treatments, and markings.

d. (U) Features. Point out unique or distinguishing external features of the item that are not obvious in the drawings.

2. (U) DESCRIPTION.

a. (U) Material. Include information pertaining to the major external components; for example, "plastic," "aluminum."

b. (U) Weight. Give the approximate weight if known.

3. (U) HAZARDOUS COMPONENTS.

ITEM QTY LOCATION EXPLOSIVE HE WEIGHT

List Hazardous components (if known).

4. (U) FUNCTIONING. Explain the operation of the ordnance, particularly the components of the ordnance involved with initiating the explosive train.

5. (U) APPEARANCE. It must be known for certain that the item is unarmed if the item is to be treated as such.

a. (U) Unarmed Condition. Example: The item is unarmed if not fired.

b. (U) Armed Condition. Example: Consider the item armed if it has been fired.

Section II. (C) EOD PROCEDURES. (EOD USE ONLY)

6. (U) RENDER SAFE PROCEDURE FOR THE UNARMED CONDITION.

a. (C) PROPOSED: (Develop and record prior to completing RSP).

b. (U) Proceed to disposal.

7. (U) RENDER SAFE PROCEDURE FOR THE ARMED CONDITION WARNINGS.

a. (C) PROPOSED: (Develop and record prior to completing RSP).

b. (U) Proceed to Disposal.
continued:

8. (U) DISPOSAL PROCEDURE.

Figure E-4. Format for a COMTECHREP - Type B (continued).

a. (U) Unarmed. Transport hazardous components to safe disposal area and dispose of by detonation.

b. (C) Armed.

(1) (Include quantity of explosives used to dispose of item).

(2) Detonate remotely.

(Confidential when filled in)

Figure E-4. Format for a COMTECHREP - Type B (continued).

COMPLEMENTARY TECHNICAL INTELLIGENCE REPORT - TYPE C

The COMTECHREP - Type C is used to report items not reported under COMTECHREP (Types A and B). COMTECHREP - Type C is submitted as soon as possible. Figure E-5 shows an example of a COMTECHREP - Type C.

(Classification)

COMTECHREP - TYPE C

A. Date found and location (map reference).

B. Type of equipment and quantity.

C. Origin.

D. Description with distinguishing marks (additional details).

E. Condition of equipment.

F. Technical characteristics of immediate tactical value (additional details).

G. Recommended disposal.

H. Name plates photographed.

I. Photographs taken.

(Classification)

Figure E-5. Format for a COMTECHREP - Type C.

(Classification)

J. Other information.

K. Designation of TECHINT collection team doing this initial exploitation.

L. Time and origin of message.

(Classification)

Figure E-5. Format for a COMTECHREP - Type C (continued).

DETAILED TECHNICAL REPORT

The DETECHREP normally is prepared at the JCMEC by the Exploitation Company, with the assistance of the national S&TI analysis personnel at the JCMEC. The DECTECHREP normally is classified. The CM&D section of the Exploitation Company sends the DETECHREP through the JTIB to the national S&TI community. They also send a summary of the report to Theater units.

TECHNICAL INTELLIGENCE UPDATE REPORT

The TECHINT Update Report is a one- to two-paragraph report on an item of equipment that has an impact on tactical operations. The report comes from information provided in PRETECHREPs and COMTECHREPs, and is unclassified. The goal of the report is to reach the lowest level—the soldier—with information of value to the soldier. The CM&D section of the Operations Company sends the report by electronic message and computer data transmission.

TECHNICAL INTELLIGENCE SUMMARY

The TECHINT Summary is a collection of information on more than one item of equipment that has an impact on theater tactical operations. The information comes from PRETECHREPs and COMTECHREPs from over a period of time or from a large CEE location. The report normally is unclassified, but if put into an overall intelligence summary, it can be classified. The CM&D section of the Exploitation Company sends the report by electronic message and computer data transmission to the JTIB. The JTIB then makes dissemination to the lowest possible level with JTF C^3I assets.

TECHNICAL INTELLIGENCE REPORT

The TIR is a critical report which goes to the highest levels of the intelligence hierarchy. The report comes from information from PRETECHREPs, COMTECHREPs, and DETECHREPs. This report is always classified and follows the format in DIAM 58-13. The CM&D section sends TIRs by electronic message to the JTIB. The JTIB disseminates them to the highest and lowest intelligence units and agencies possible.

Appendix F

COLLECTION AND EXPLOITATION REQUIREMENTS

INTRODUCTION

This appendix includes guidance on how to develop a TECHINT collection plan, and a listing of general exploitation categories regarding items of interest to battlefield TECHINT. It is included only as a field guide, and is not an all-inclusive exploitation plan.

TECHINT COLLECTION PLAN GUIDANCE

TECHINT elements are a very limited resource requiring specific collection planning to be effective. The most critical TECHINT items for collection are found in the TECHINT Appendix to the OPLAN or OPORD. The following steps help determine pertinent items in the collection plan before it is accepted.

STEP 1. Identify the equipment OB for the threat; for example, items such as individual soldier's equipment, maps, small arms, heavy weapons, and explosives. Also include every type of equipment the threat could have on the battlefield. This is an ongoing effort, with the OB always being updated. In addition to the collection plan, include overlays of locations of ASPs, maintenance points, SAMs, communications centers, and other locations that contain quantities of equipment for collection.

STEP 2. In coordination with DIA, national S&TI requirements, and Theater and Corps PIR and IR, the TECHINT unit prioritizes collection of items from the OB. If coordination is not possible, the equipment that is the greatest threat to the conduct of tactical operations is prioritized.

STEP 3. The DOD Foreign Acquisition List is used to guide TECHINT priorities. These collection priorities are published in the Intelligence Annex to the OPORD in the form of a collection plan. As collection takes place, the updated collection plan is then sent to TECHINT and theater units in message format.

STEP 4. The TECHINT collection requirements are then cross-referenced to the known threat OB. TECHINT elements are then tasked, if possible, with specific collection of items from the threat units that they are facing. In addition, the Corps TECHINT LNE coordinates with the Corps G2 to give specific collection requirements to the Corps units. The JTIB coordinates

with the Theater J2 to give collection requirements to theater units such as Special Operations units.

STEP 5. In addition to the TECHINT collection priority list for equipment, TECHINT elements are tasked to collect, inspect, or develop the following items:

- Threat equipment manuals or documents.
- Threat installations.
- Listing of TECHINT questions for the interrogation of EPWs.
- CB laboratories and samples.

STEP 6. The 203d MI Battalion, in coordination with national S&TI agencies, maintains contingency TECHINT collection plans for possible threat forces. When a TECHINT element deploys, it is given the TECHINT collection plan in order to prepare and train for operations.

EXPLOITATION PLANS AND REQUIREMENTS

GENERAL EXPLOITATION PLAN:

The JCMEC is expected to conduct this level of exploitation on all equipment in theater. The Corps RC TECHINT sections at the CMEC conduct this level on equipment that matched the MOSs in their elements. The TECHINT collection teams are prepared to do this, but normally would not do it on a large scale.

Preliminary requirements for exploitation include—

- Preliminary photographs of CEM outside and inside (to shows status of equipment before assessment).
- An inventory.
  - — Examine system for any written information (documents, operator manuals, maps), markings, data plates, or operating instructions.
  - — Identify all individual equipment components requiring separate analysis.
- If equipment requires further analysis beyond initial exploitation, begin planning for further detailed exploitation with national S&TI personnel.

- The exploitation, with finished report, is accomplished within 48 hours.

The JCMEC normally is the primary center for all detailed exploitations in theater.

Once the general exploitation is accomplished, a more detailed exploitation begins. This is in coordination with the national S&TI SME at the JCMEC. The plan is provided by the national S&TI community.

The JCMEC maintains in the Exploitation Company detailed exploitation plans for collection priority equipment. These plans are part of the contingency database for the threat equipment. The time limit for a detailed exploitation is determined by the tactical needs of the theater and national requirements.

Appendix G

FOREIGN LANGUAGE TEXT RECOGNITION

INTRODUCTION

When TECHINT personnel are able to correctly identify foreign languages used in documents or equipment, it has two immediate benefits. First, it helps identify the equipment or type of document and where or who is using it. Second, it ensures that TECHINT personnel request the correct linguistic support.

This appendix contains language identification hints that will enable TECHINT personnel to quickly identify some of the many languages used in documents, on equipment plates, and on other materiel. TECHINT personnel can speed up the entire battlefield TECHINT process by following the guidance herein.

The language identification hints were compiled by NGIC. There are thousands of languages and dialects in use in the world today; therefore, this material is not complete. The following include examples of the use of language identification during TECHINT operations.

- A TECHINT team discovers an ADA system that looks like a Russian ZPU-4 ADA gun. But on closer examination, the technical analysis identifies Chinese characters on a data plate and on the tires. This could mean that this ADA gun is from China, and this observation needs to be reported to TECHINT elements and to the CMEC.

- TECHINT personnel find a document in Arabic, but the country they are in speak and write only Spanish. This document could be of intelligence value and would require being reported to TECHINT elements and to document exploitation (DOCEX) personnel.

LANGUAGE SYSTEMS

The world's written languages can be divided into alphabet languages and character languages. The only present-day character system is the Chinese system, which has been borrowed by other languages. But there are many alphabets. The most important alphabets currently in use are—

- The Roman alphabet (used by English and many other languages).

- The Cyrillic alphabet (used by Russian, some other Slavic languages, and most of the minority languages of Russia).

- The Arabic alphabet (used in the Middle East and other areas influenced by Islam).

Other alphabets exist, but their use is more restricted. (Figure G-1 shows some of these spoken languages and some of the locations where they are spoken.)

- The Hebrew alphabet for Hebrew and Yiddish; the Greek alphabet for Greek.

- The Devanagari alphabet for Sanskrit and other languages of India.

In addition, there are special alphabets for languages like Georgian, Telugu, the other Dravidian languages in southern India, Laos, and other languages in southeast Asia, and Amharic in Ethiopia.

Illustrations of the main alphabets are normally available in standard desktop dictionaries. Many unusual scripts are illustrated in Romanization Guides, revised and enlarged edition, put out by the Office of the Geographer, Directorate for Functional Research, Bureau of Intelligence and Research, US Department of State, and the US Board on Geographic Names, dated 1 April 1972.

Reliable detailed information about foreign languages for people who cannot actually read them is available in manuals compiled for professional librarians. These manuals can be found at your local library.

ROMAN ALPHABET LANGUAGES

The most complex language recognition problem is to distinguish between the numerous languages that use the Roman alphabet. The 26-letter alphabet is used here as the basic alphabet. The other Roman alphabet languages use these same letters, but many use fewer than 26 and a few use more.

Unfortunately, just because a letter is not used is not a very useful language recognition criterion. This is because it is difficult to know whether a letter is absent because it is never used or because it simply was not needed to write the text in question.

Language	Location
Chinese	People's Republic of China, Taiwan, Hong Kong, Thailand
English	United States, Canada, Great Britain, Ireland, Australia, New Zealand
Spanish	Spain, South America, Central America, Mexico
Hindi	North Central India
Russian	Soviet Union, Europe
Arabic	Saudi Arabia, Yemen, South Yemen, United Arab Emirates, Oman, Kuwait, Bahrain, Qatar, Iraq, Syria, Jordan, Lebanon, Egypt, Sudan, Libya, Tunisia, Algeria, Morocco
Portuguese	Portugal, Brazil, Africa, Asia
Japanese	Japan
German	Germany, Austria, Switzerland
Urdu	Pakistan, India
French	France, Belgium, Switzerland, Canada, Morocco, Tunisia, Algeria, Lebanon, Syria, Laos, Cambodia, Vietnam
Korean	Korea, China, Japan
Italian	Italy, Switzerland
Vietnamese	Vietnam
Turkish	Turkey, Bulgaria, Greece, Cyprus
Persian (Farsi, Dari)	Iran, Afghanistan (Tadzhik, USSR)
Polish	Poland, United States, Soviet Union
Ukrainian	Ukrainian SSR
Rumanian	Romania, Moldavian SSR
Serbian (Croatian)	Yugoslavia
Pashto	Afghanistan, Northwest Pakistan
Czech (Slovak)	Czechoslovakia
Dutch	Netherlands, Suriname, Belgium
Hungarian	Hungary, Romania, Czechoslovakia, Yugoslavia
Danish (Norwegian)	Denmark, Norway
Bulgarian	Bulgaria
Swedish	Sweden
Belorussian	Belorussian SSR
Finnish	Finland
Albanian	Albania, Yugoslavia
Lithuanian	Lithuanian SSR
Latvian	Latvian SSR
Slovenian	Slovenia (Northwest Yugoslavia)
Estonian	Estonian SSR
Macedonian	Macedonia (Yugoslavia)

Figure G-1. A partial list of spoken languages and locations where they are spoken.

Five of the letters <a, e, i, o, u> are referred to collectively as "vowels," while the rest are called collectively "consonants." The rules designating letters as vowels or consonants vary from language to language. Some languages, for instance, consider <l>, <r>, or <y> to be vowels. Most of the Roman alphabet languages modify letters by putting extra marks above, in, or below them. **These marks are called diacritics. They are among the best criteria for language recognition.**

DIACRITICS

Figure G-2 shows the principal diacritics used by various languages to modify the Roman alphabet. Figure G-3 shows the languages that use these diacritics. It also summarizes the occurrence of various diacritics in selected Roman alphabet languages and gives examples of letters with diacritics on them. The diacritics are divided into three groups, depending on whether they are written above, in, or below the letter. They are given standard names for convenience; their actual names vary from language to language.

DIACRITICS ABOVE THE LETTER

Grave	<` >	Acute	<´>	Circumflex	<^>
Hacek	<ˇ>	Breve	<˘ >	Macron	<¯>
Tilde	<~>	Krouzek	<°>	Dot	<˙>
Dieresis	<u>	Double Acute	<˝>	Apostrophe	<'>
Question	<?>	Umlaut	<ä>	Back Apostrophe	<ë>

DIACRITICS IN THE LETTER

Bar	<->	Slash	</>	Horn	<’ >

DIACRITICS UNDER THE LETTER

Cedilla	<î>	Ogonek	< >	Comma	<,>
		Low Dot	<.>

WESTERN EUROPEAN LANGUAGES

Western European languages include those commonly called Romance and Germanic languages.

DIACRITICS WRITTEN ABOVE THE LETTER	
<`> grave:	French, Italian, Portuguese, Vietnamese, e.g., <à>
<´>acute:	Croatian, Czech, French, Greek, Hungarian, Italian, Polish <N, O, S, C, Z>, Slovak, Spanish, Portuguese, Vietnamese; e.g., <á, ó>
<^> circumflex:	French, Italian, Portuguese, Rumanian, Vietnamese, Turkish, e.g.,<â, ô>
<v> hacek:	Croatian, Czech, Estonian, Latvian, Lithuanian <S, Z, C>,Slovak, Slovenian, e.g., <č, ě>
< > breve:	Rumanian, Turkish, Vietnamese; e.g., <ă, ğ>
<¯ > macron:	Latvian, Lithuanian; e.g., <ā, ū>
<~> tilde:	Estonian, Portuguese, Spanish, Vietnamese; e.g., <ã, ñ>
<°> krouzek:	Czech, Danish, Norwegian, Swedish; e.g., <å, e>
<.> dot:	Lithuanian <e>, Polish, Turkish, e.g., <ė, ż>
<u> dieresis:	Albanian, Estonian, Finnish, French, German, Hungarian, Slovak, Portuguese <ü>, Spanish, Swedish, Turkish; e.g., <ä, ë>
<"> double acute:	Hungarian; e.g., <ő, ű>
<'> apostrophe:	Czech, French, Slovak; e.g., <ď, ť>
<?> question:	Vietnamese; e.g., <a, e>
<{> back apostrophe:	Latvian; e.g., <g>
DIACRITICS WRITTEN IN (OR TOUCHING) THE LETTER	
<-> bar:	Croatian, Polish, Vietnamese; e.g., <d,1, a>
</> slash:	Danish, Norwegian, Polish; e.g., <1, 0>
<»> horn:	Vietnamese; e.g., <ũ, õ>
DIACRITICS WRITTEN UNDER THE SEAT	
<¸> cedilla:	Albanian, French, Portuguese, Turkish, e.g., <ç, ş>
<˛> ogonek:	Lithuanian
<,> comma:	Latvian, Rumanian; e.g., <k, ş>
<.> low dot:	Vietnamese; e.g., <a, e>

Figure G-3. The occurrence of diacritics in various languages.

DISTINGUISHING FRENCH, GERMAN, AND DUTCH

FRENCH:

French is generally easiest to recognize because it is so familiar and has so many words in common with English. French uses acute <´> and grave <`> on <e>. Acute is not used on any other letters, but grave is used occasionally on <a> and <u>. Circumflex <^> is used on <a, e, i, o, u> and cedilla <¸> is used under <c>. The French commonly omit diacritics over capital letters and in typescript. Definite article forms: le, la, les. French also uses a trëma <oe, ï, ë>.

GERMAN:

German uses the umlaut <¨u> on <a, o, u>. This is the language's only diacritic. German also uses a special letter, the Eszett < >, which does not begin a word. In regular prose, capitalization is rather frequent since all nouns are capitalized. Definite article forms: der, die, das, des, dem, den.

DUTCH:

Dutch can be mistaken for German; however, Dutch does not capitalize its nouns in regular prose. Dutch adopted a few diacritical forms from the French language. These include: acute <een>; grave <crepe>; apostrophe <'t, z'n, d'r, etc.>; dieresis <België>; and sometimes the cedilla <¸>. Definite article forms: de and het.

DISTINGUISHING SPANISH, PORTUGUESE, AND ITALIAN

For Spanish, look for acutes occasionally over vowels, tilde <~> over <n> but not over vowels, no grave accents, and words that end in <n>. For Portuguese look for the tilde over <a> and <o> but not over <n>, the cedilla under <c>, and some words that end in <m>. For Italian look for occasional graves over vowels, no tildes or cedillas, and numerous doubled consonants; for example, <tt>, <gg>, <pp>, <vv>, and so forth. Of course, look for the definite articles; they are frequently used and mostly different in the three languages.

SPANISH:

Spanish uses acute <´> on vowels <a, e, i, o, u> and tilde <~> on <n>. Since the acute marks irregular word accent, there will normally be no more than one acute per word and it will appear on the last vowel or third from last vowel. Dieresis <¨u> is used occasionally over <u>. Grave <`> and circumflex <^> are not used. Definite article forms: el, la, los, las.

PORTUGUESE:

Portuguese uses acute <'>, grave <'>, and circumflex <^> occasionally over vowels, and tilde <~> frequently over <a> and <o>. Cedilla < ¸> is used under <c>. Dieresis <¨u> is used over vowels occasionally. Definite article forms: o, os, a, as.

ITALIAN:

Italian uses acute <´> on <e> and grave <`> on vowels <a, e, i, o, u> to indicate unusual accent. Some type fonts may substitute circumflex <^> for grave. Normally there will be no more than one grave per word, and it will appear on the last vowel or third from last vowel. Definite article forms: il, lo, i, gli, la, le.

NORTHERN EUROPEAN LANGUAGES

Northern European languages include North Germanic and Slavic, as well as unique languages of the Finno-Ugric family. The distinguishing features of each are described below.

SWEDISH:

Swedish uses dieresis <¨u> on <a> and <o> and krouzek <^{O}> on <a>. A frequent word is och; meaning "and."

DANISH AND NORWEGIAN:

Danish and Norwegian use the same alphabet as Swedan. They use krouzek <^{O}> on <a> and slash </> on <o>, and a special letter, the ae digraph <Æ, æ>. Written Danish and Norwegian are difficult to tell apart, but anyone who can read one can make sense out of the other. A frequent word in both languages is og; meaning "and."

FINNISH:

Finnish is very different from the other northern European languages, but it is similar to Estonian. Finnish uses dieresis <¨u> on <a> and <o>. About 60 percent of the average text consists of vowels (including <y>). Look for frequent double vowels; <aa>, <ee>, <ii>, etc.

ESTONIAN:

Estonian uses tilde <~> on <o>, dieresis <¨u> on <a, o, u>, and hacek <^{V}> on <s, z> infrequently in foreign words. At first glance Estonian looks very much like Finnish, and both are of the Finno-Ugric family. To tell the two languages apart, look for <y> (Finnish) or <u> with dieresis (Estonian).

HUNGARIAN:

Hungarian uses acute <´> on <a, e, i, o, u>, dieresis <¨u> on <o, u>, and double acute <˝> on <o, u>. These three diacritics are very frequent and should all appear in an average paragraph. Definite article forms: a, az. Although not Northern European, Hungarian is listed here because it is in the Finno-Ugric family.

ROMAN ALPHABET SLAVIC LANGUAGES

It is often difficult to distinguish between the Roman alphabet Slavic languages. Of these languages, Polish is easiest to distinguish from the rest because it does not use hacek <^{V}>, whereas the others do; and because it uses <w> frequently and <v> almost never, whereas the opposite situation occurs in the other languages.

The languages of Czechoslovakia—Czech and Slovak—can be distinguished from the Roman alphabet languages of the former Yugoslavia, Croatia, and Serbia because Czech and Slovak use acute <'> on vowels (including <y>) and Croatian and Slovenian do not. Acutes are so frequent in Czech and Slovak that the absence of acutes in an average-length sentence can be taken as a valid negative test.

The presence of the diacritics listed above for Croatian indicate that it may be Croatian; but there is no convenient way to test for Slovenian against Croatian. If in doubt between Croatian and Slovenian, assume Croatian unless it can be established that the text was published in Ljubljana.

POLISH:

Polish uses acute <´> on <c, n, o, s, z>; ogonek <˛> on <a, e>; bar <-> (occasionally depending on font as a substitute for slash) on <L,1, Z>, such as <L, 1, Z>; and < > dot on <z>. Letters <w> and <z> are very frequent in Polish, and the <v> almost never occurs.

CZECH:

Czech uses acute <´> on <a, e, i, o, u, y>, hacek <^{V}> on <c, d, e, n, r, s, t, z>, krouzek <^{O}> on <u>. The letter <r> with hacek is frequent in Czech and lacking in Slovak.

SLOVAK:

Slovak uses acute <´> on <a, e, i, l, r, o, u, y>; dieresis <¨> on <a>; circumflex <^> on <o>; hacek <^{V}> on <c, d, l, n, s, t, z>; and apostrophe <'> on <d, l, t>. The digraph <ie> is fairly frequent in Slovak and very infrequent in Czech. Slovak is used in eastern Czechoslovakia. Suspect Slovak if Bratislava is the origin.

CROATIAN:

Croatian uses acute <´> on <c>, hacek <^{V}> on <c, s, z>, and bar <-> on <d>. Croatian is used in northern and coastal Yugoslavia around the city of Zargreb.

SLOVENIAN:

Slovenian uses hacek <ˇ> on <c, s, z> and no other diacritics. Slovenian is used in extreme northwest Yugoslavia around the city of Ljubljana.

RUMANIAN:

Rumanian uses breve <ˇ> on <a>, circumflex <^> on <a, i>, and comma <,> under <s, t>.

ALBANIAN:

Albanian uses dieresis <u> on <e> and cedilla <¸> under <c>. The <e> with dieresis is very common. Another recognition mark of Albanian is the use of <q> without <u>.

LITHUANIAN:

Lithuanian uses hacek <ˇ> on <c, s, z>, macron <¯> on <u>, dot < > on <e>, and ogonek <˛> under <a, e, i, u>. The frequent occurrence of ogonek is a good recognition sign for Lithuanian.

LATVIAN:

Latvian uses hacek <ˇ> on <c, s, z>, macron <¯> on <a, e, i, o, u>, and comma <,> under <k, l, n>. Comma is also used under <G> (upper case letter only), while back apostrophe <`> is used on <g> (lower case letter only). In this case the two marks are variant forms of the same diacritic. The macrons and commas are a good recognition sign for Latvian.

OTHER ROMAN ALPHABET LANGUAGES

Turkish and Vietnamese use the Roman alphabet with unusual diacritics.

TURKISH:

Turkish uses breve <ˇ> on <g>, dieresis <u> on <o, u>, and cedilla <¸> on <c>. Turkish has two forms of the letter <i>. One has the upper case < > and a corresponding lower < > that looks like an "i" without the dot.
The other letter has the lower case form <i> (the same as English) and a corresponding upper case form that looks like English " " with a dot < >.
Turkish also uses circumflex <^ > <latif> <lugat>.

VIETNAMESE:

Vietnamese uses a very complex system of diacritics. It uses breve <ˇ> on <a>, circumflex <^> on <a, e, o>, horn <˝> on <o, u>, and bar <-> on <d>. In addition to these, the following five diacritics are used with vowels to indicate tone: grave <`>, acute <´>, low dot <.>, question <?>, and tilde <~>. Vowels with breve, circumflex, and horn can, and often do, have a tone diacritic. So, in Vietnamese, one letter can have two diacritics on it.

CYRILLIC ALPHABET LANGUAGES

The Cyrillic alphabet is used to write Russian, Ukrainian, Belorussian, and many minority languages from the former Soviet Union. It is also used to write Bulgarian and Serbian. The Cyrillic alphabet and the Roman alphabet are both derived from forms of the Greek alphabet so there is a general resemblance. Some Cyrillic letters seem to Americans to be backwards or oddly shaped. Figure G-4 shows the characters and diacritics not found in Russian. With the exception of one letter, , which is only used sometimes in Russian, none of these letters appear in the normal Russian text.

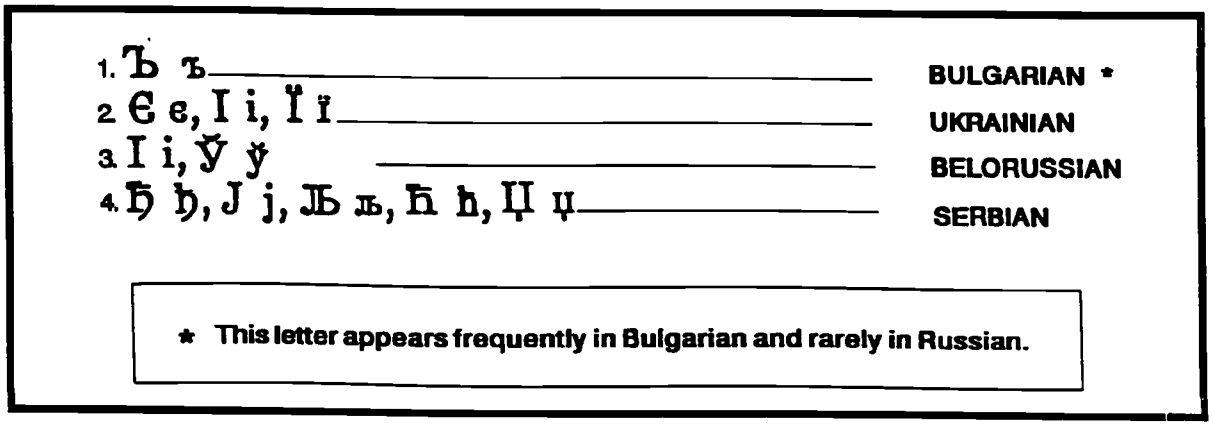

Figure G-4. Distinguishing major Slavic languages from Russian.

SLAVIC LANGUAGES:

Figure G-4 gives the simplest recognition guide for identifying documents that look like Russian but are actually other Slavic languages or minority languages.

TRANSLITERATION:

Figure G-5 shows the different forms of the Cyrillic alphabet for five principal Cyrillic alphabet languages and the recommended transliterations for each letter. Pay particular attention to the transliteration of Russian. These equivalents must be used when reporting on materiel bearing Russian nameplates. DO NOT REPORT ON FOREIGN EQUIPMENT AND DOCUMENTS USING THE ORIGINAL CYRILLIC CHARACTER. The Figure classifies each letter as "C" for consonant or "N" for nonconsonant.

RUSSIAN:

Russian is the most frequently encountered Cyrillic alphabet language and should always be the prime suspect. The key to recognizing Russian is the fact that it uses both letter 12 and letter 39 and does not use letter 13 at all. (See Figure G-5.)

BULGARIAN:

Bulgarian is perhaps the second most frequently encountered Cyrillic alphabet language and the most difficult for the nonspecialists to differentiate from Russian. Bulgarian uses fewer letters than Russian.

NOTE: In the following discussion, the letters are referred to by their numbers on the chart in Figure G-5.

For example, a letter used often in Russian and never in Bulgarian is the letter 39; however, the way to be sure that it is not Bulgarian is to see if the letter 38 comes before a consonant or "C" letter. Note that letter 38 is frequent in Bulgarian and rare in Russian; moreover, when letter 38 occurs in Russian, it always occurs before an "N" letter.

Proper transliteration is very important. When an analyst reads a Russian nameplate and writes down P-105A, but it is actually an R-105D (P is not P, rather "R," and < > is wrongly symbolized by A); then it results in incorrect reporting.

The column in Figure G-5 marked "Other" is not supplied with any transliteration equivalents. This column contains similar letters that are encountered in the written languages of various minority nationalities in the former USSR. These languages belong mainly to the Uralic family or the Altaic family, and a Russian linguist will be unable to make any sense out of them. Recognition of any documents in these languages as non-Slavic is a helpful first step in DOCEX.

Figure G-5. Cyrillic alphabet and transliteration chart.

NOTES:

1. The letters are numbered sequentially for ease of reference. The alphabetic order given is the convenient one, which is not necessarily the traditional one.

2. The letters marked "N" are nonconsonants; and the letters marked "C" are consonants.

3. Letters 7 and 8 have alternate transliterations for Russian and Belorussian. In all cases, the first transliteration is used when the letter occurs after a "C" letter; the second transliteration is used in all other cases, including when the letter begins the word.

4. Letter 8 is not considered a separate letter and its dieresis is often omitted.

5. Letter 4 is pronounced something like "h" in Ukrainian and Belorussian and "h" is often the recommended transliteration. However, transliteration "g" is recommended here to eliminate confusion with the letters transliterated "sh" and "zh."

6. The "Other" category refers to various minority languages in the Soviet Union, many of which are Uralic or Altaic languages.

Figure G-5. Cyrillic alphabet and transliteration chart (continued) .

UKRAINIAN:

Ukrainian is distinguished by the use of letters 12 and 13 and the non-use of letter 39. Letters 9 and 14 also are unique to Ukrainian, but their frequency is low and their absence may be accidental. When Ukrainian is identified, pay particular attention to the transliteration of letter 12. The recommended transliteration for letter 4 is "g" even though its pronunciation is closer to English "h."

BELORUSSIAN:

Belorussian is distinguished by the use of letters 13 and 39 and the non-use of letter 12. Letter 30 is unique to Belorussian, but its frequency is not high enough to use it as an identification sign. As in Ukrainian, letter 4 in Belorussian is transliterated "g" and pronounced like "h."

SERBIAN:

Serbian is spotted easily by the several unique letters it uses: letters 6, 16, 19, 22, 28, and 35. Serbian is conventionally transliterated into Croatian, and this is what the chart gives. The diacritics of the Croatian script are discussed in the **"ROMAN ALPHABET LANGUAGES"** section above.

MACEDONIAN:

Macedonian is spoken by perhaps two million people in southeastern Yugoslavia. The Macedonian alphabet is similar to the Serbian, except that letters 6 and 28 are not used and three other letters are added. The added letters are letter 4 with an acute <ˉ>, letter 17 with an acute <ˉ>, and <S, s>. Macedonian language documents are rare.

ARABIC ALPHABET LANGUAGES

The Arabic alphabet has generally followed the spread of Islam and has been used to write numerous languages, some of which (notably Turkish) no longer use it. This alphabet, appropriately modified, currently is used for all the dialects of Arabic and for Persian, Urdu, and other Indo-Iranian languages, such as Dari, Pashto, and Kurdish. The Russian and Cyrillic alphabets seem even more related to one another when compared to Arabic.

ARABIC AND PERSIAN:

The best distinction a nonlinguist can make is to separate Persian documents from Arabic documents. Persian linguists cannot read Arabic, and vice versa, unless they know both languages.

ARABIC:

Arabic is spoken over a large area extending from Morocco on the west to borders of ancient Persia (modern Iran) on the east. The spoken language varies widely in this area, but the written language is fairly standard. Only a specialist could hope to distinguish the varieties of Arabic, but a sharp-eyed nonlinguist can learn to recognize Arabic and distinguish it from Persian. The best indication is perhaps the presence of letter 32, which is not used in Persian. The next best indication is perhaps the frequent occurrence of the definite article < >, which is spelled with letter 1 (initial) and letter 27 (initial). A final characteristic is the absence of the special Persian letters: letters 3, 7, 14 , and 26. Since this is a negative indication, however, it cannot be used by itself to prove that a text is Arabic.

PERSIAN:

Persian is used in Iran. It is indicated by the presence of the special Persian letters 3, 7, 14, and 26, and by the absence of letter 32. Other indications are a paucity of letter 1 and 27 combinations (the Arabic definite article) and a slightly different preference in numeral usage.

ARABIC NUMERALS:

In school, the numerals used in the United States and most of the rest of the world are often called "Arabic numerals," but these are not the same forms used in Arabic alphabet languages. The real Arabic numerals are illustrated in Figure G-6. This figure also shows Arabic and Persian variants of the numerals along with their international equivalents. Unlike the Arabic alphabet (which is, of course, read from right to left), **ARABIC NUMERALS ARE READ FROM LEFT TO RIGHT, THE SAME WAY AS OUR OWN NUMERALS ARE READ.**

Document collectors should familiarize themselves with the Arabic numerals so they can read page numbers in collected documents and properly reassemble documents that have come apart. Collectors should remember that one of the results of the right-to-left orientation of the Arabic alphabet is that the apparent "back" of a document is actually the front.

Figure G-7 illustrates the Arabic alphabet in its Arabic and Persian variants. Notice that each letter has four forms, labeled "alone," "final," "medial," and "initial." Notice that "initial" is to the right of "final." These column labels indicate two of the main differences between Arabic script and Roman script: First, the letters change in order to connect to other letters, and second, **THE SCRIPT IS WRITTEN FROM RIGHT TO LEFT.**
The letters with asterisks by their numbers cannot connect to a following letter. The initial form is used to begin a word or when the letter follows a nonconnectable letter. The medial form is used after a connectable letter or when it is used by itself; for example, to letter paragraphs in a document.

DIACRITICS:

Another feature of the Arabic alphabet is the use of diacritics to differentiate many of the letters. Figure G-8 illustrates the diacritics used in Arabic and Persian.

Using Figures G-7 and G-8, note that letters 2, 3, 4, 5, 29, and (partially) 33 have the same base form with the following diacritics: high dot < ˙>, letter 29; low dot <**$**>, letter 2; high double dot <¨>, letter 4; low double dot <‗>, letter 33, initial and medial only; high triple dot < ˆ>, letter 5; and low triple dot <‡>, letter 3.

Letter 8 is the base form for another diacritic set: High dot < ˙>, letter 9; low dot <**$**>, letter 6; low triple dot **<**‡>, letter 7. Letter 10 is the base form, and letter 11 adds high dot < ˙>. Letter 12 is the base form. A Letter 13 adds high dot < ˙>, and letter 14 adds high triple dot < ˆ>. Letter 15 is the base form and letter 16 adds high triple dot < ˆ>.

International	Arabic	Persian	International	Arabic	Persian
0	٠	٥ or ٠	6	٦	۶ or ٦
1	١	١	7	٧	٧
2	٢	٢	8	٨	٨
3	٣	٣	9	٩	٩
4	٤	۴ or ٤	10	١٠	١٥ or ١٠
5	٥	۵ or ٥	20	٢٠	٢٥ or ٢٠

Figure G-6. International, Arabic, and Persian numbers.

Letters 17, 19, and 21 are the base forms for letters 18, 20, and 22 respectively; the added diacritic for all three is high dot <˙>. Letters 23 and 24 have approximately the same base form with high dot <˙> on letter 23 and high double dot <¨> on letter 24. Letters 25 and 26 have the same base form. Letter 25 uses flag <´> on its initial and medial forms and hamza sign <À> on its final and alone forms.

Letter 26 uses double flag <˝> on all its forms and hamza sign <¸> on its final and alone forms. Letter 31 is the base form, and letter 32 uses high double dot <¨>. For grammatical reasons, letter 32 is not used initially or medially.

SAMPLES OF ARABIC AND PERSIAN

Figure G-9 gives a sample of printed Arabic. Note the frequent occurrences of letter 1 and letter 27: the definite article at word beginnings. Remember, words begin on the right. The seventh line from the top, for instance, has four obvious occurrences and two other occurrences in modified forms that have not been discussed here. There are 18 occurrences of letter 32, at least one occurrence in every line except lines 9 and 11 and four occurrences in lines 3 and 8.

Figure G-8. The diacritics of Arabic and Persian.

وفضـلا عن ذلـك فلقد كان فى كل القوانين القائمة ما يكفى لمواجهة الأحداث والاضطرابات التى وقعت وكذلك للنظر فى أمر ما نسبه رئيس الجمهورية فى خطابه إلى أحزاب الأقلية ، وإلى الجماعات الإسلامية ، وإلى بعض الشخصيات المدنية المسلمة ، والمسيحية . . فالقـوانين القائمة تكفل الحفاظ على أمن البلاد وسلامتها ضد ما يهدد وحدتها الوطنية من أخطار وبالتالى فان القرار المطعون فيه لايمكن أن يعتبر - بحال - عملا من أعمال الضرورة - كما أن القرار المطعون فيه خالف صريح نص المادة ٤١ من الدستور التى تنص على عدم جواز القبض أو تقييد الحريات فى غير حالة التلبس إلا بأمر من القـاضى المختص أو النيابـة العامة ، تستلزمه ضرورةالتحقيق وصيانة أمن المجتمع وفقا لأحكام القانون - وأنه لم يرد فى أوراق الدعوى أى دليل على أن المتحفظ عليهم ضبطوا فى حالة تلبس أو أنه أجرى معهم تحقيق سابق على التحفظ ، حتى يتضح منه أن هذا التحفظ كان اجراء لازما .

Figure G-9. Printed Arabic.

Figure G-10 illustrates typewritten Arabic. Note that lines 1, 2 5, and 10 begin (on the right) with the definite article (letter 1 and letter 27). There are 20 other obvious occurrences of these letters at the beginning of words and several others that are less obvious. Lines 1, 2, and 9 end (on the left) with letter 32. Letter 32 occurs five other times in the sample. Arabic script permits some letters to be stretched in order to even out text on the left. The long lines at the left of the sample are instances of this.

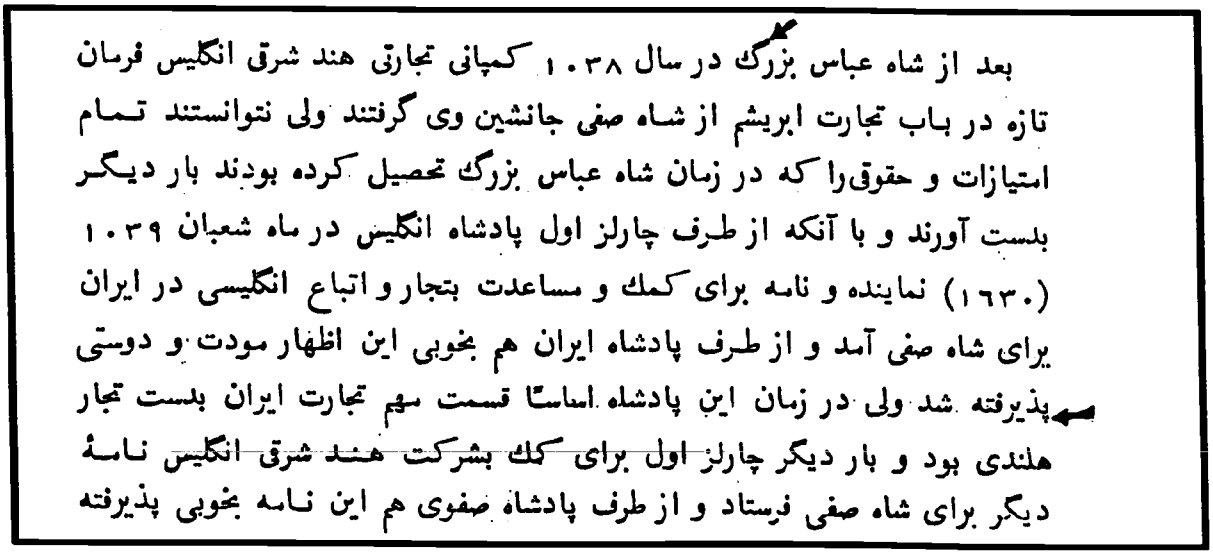
Figure G-10. Typewritten Arabic.

Figure G-11 illustrates printed Persian. Note the double flags <˝>, two in the first line and eight more in the rest of the sample. Note the low triple dots <$_{\ddagger}$>, one in the first line and eight more in the rest of the sample. Neither of these diacritics occurs in Arabic.



بعد از شاه عباس بزرگ در سال ۱۰۳۸ کمپانی تجارتی هند شرق انگلیس فرمان
تازه در باب تجارت ابریشم از شاه صفی جانشین وی گرفتند ولی نتوانستند تمام
امتیازات و حقوق‌را که در زمان شاه عباس بزرگ تحصیل کرده بودند بار دیگر
بدست آورند و با آنکه از طرف چارلز اول پادشاه انگلیس در ماه شعبان ۱۰۳۹
(۱۶۳۰) نماینده و نامه برای کمك و مساعدت بتجار و اتباع انگلیسی در ایران
برای شاه صفی آمد و از طرف پادشاه ایران هم بخوبی این اظهار مودت و دوستی
پذیرفته شد ولی در زمان این پادشاه اساساً قسمت مهم تجارت ایران بدست تجار
هلندی بود و بار دیگر چارلز اول برای کمك بشرکت هند شرق انگلیس نامهٔ
دیگر برای شاه صفی فرستاد و از طرف پادشاه صفوی هم این نامه بخوبی پذیرفته

Figure G-11. Printed Persian (arrows indicate distinguishing features).

OTHER ARABIC ALPHABET LANGUAGES

DARI:

Dari is used in Afghanistan and favored by the government. Since its written form is heavily influenced by Persian models, there is no easy way for the nonspecialist to distinguish it from Persian.

KURDISH, PASHTO, AND URDU:

The other notable Arabic alphabet languages are Kurdish, Pashto, and Urdu. Kurdish is spoken by the Kurdish tribes of Iraq, Iran, and Turkey. Pashto is used widely in Afghanistan, and Urdu is the predominant language of Pakistan. These languages contain letters and diacritics not listed for Arabic or Persian. If one of these languages is suspected, refer the problem to a linguist.

CHARACTER LANGUAGES

Character languages use writing systems with symbols that stand for words or meaningful elements of words rather than for sounds. Character languages, such as hieroglyphic Egyptian, existed in earlier times; but today, the only character languages are Chinese and languages that have wholly or partially borrowed the Chinese system, such as Japanese and Korean.

DISTINGUISHING CHINESE, JAPANESE, AND KOREAN:

The easy way to distinguish the three languages is to look for the distinctive phonetic symbols of Japanese and Korean. If these symbols are not present, conclude that the language is Chinese. Chinese is the model for the other two, and these languages borrow freely from Chinese. Figures G-12, G-13, and G-14 give sample texts of Chinese, Japanese, and Korean.

Figure G-12 shows Chinese characters. They are more detailed, complex, and square or precise than Japanese or Korean.

Korean and Japanese language texts use Chinese characters whenever it might be unclear to use one of their own symbols. This means that the higher or more academic a text is the more Chinese characters it will have.

出 版 说 明

《汉英词典》是由北京外国语学院英语系编写的。编写工作于一九七一年开始，一九七八年夏完成，历时八载。先后参加编写、修改等工作的中外专家共五十余人。

本书的主编为北京外国语学院英语系系主任吴景荣教授。除编写组编辑人员外，还有不少专家和学者先后参加过这项工作。周珏良主持了初稿的编写，弗兰克·怀利（Frank Wylie）和何南喜（Nancy Hodes）参加了英语修改工作。在组内工作了较长时间的还有初大告、水天同、王锡钧、张道真、王瑞、俞天民、吴国瑞、杨志才、吴石牧、陈国成、张月平等。在词典编写过程中，还得到丘茉莉（Elsie Fairfax-Cholmeley）、舒裕禄（Norman Shulman）和裘克安等对本书的编辑和出版提出了许多宝贵的意见。

本书是一部中型语文工具书，全书收汉语单字条目六千多，其中包括极少数的音变字，收入的多字条目五万余，连同合成词、词化短语、及例证等共达十二万余。

除一般词语外，还收一些常见的文言词语、方言、成语、谚语，以及自然科学和社会科学的常用词语。

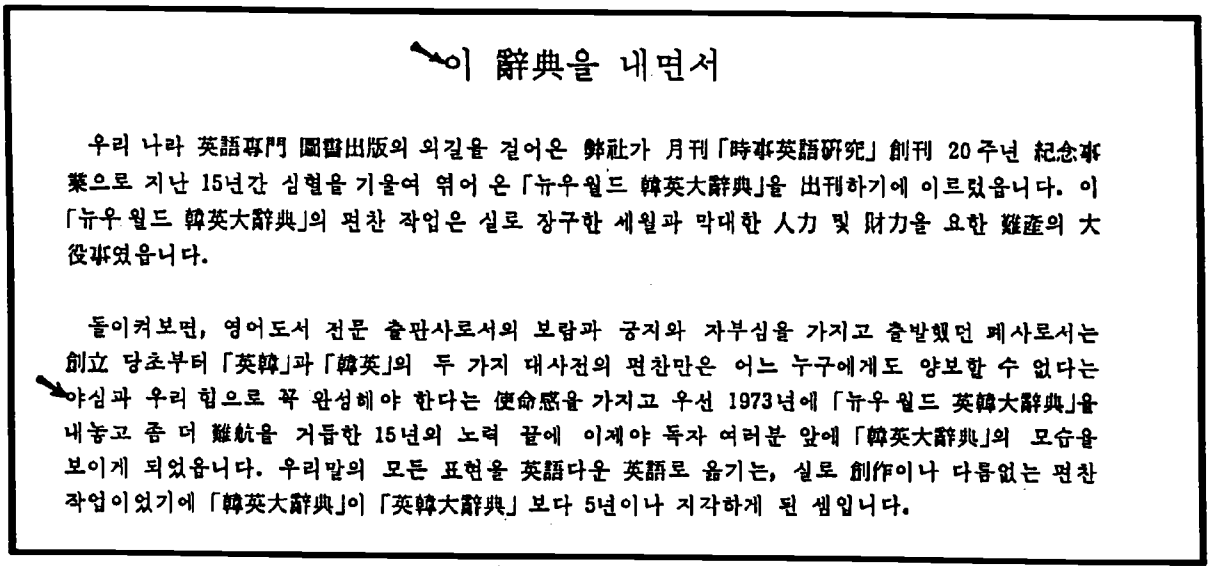
改訂増補の序

辞書は造られた日から古くなりつつある．こう言えば，辞書編集者には，まことに皮肉に響くのであるが，しかも半面の真理を含んでいる．研究社「新英和大辞典」については，1953 年版の発行と同時に，改訂のため待機の姿勢が整えられたのであるが，誤植の訂正はもちろんのこと，内容と形式の統一について一層適切な処置を施すことに，たゆみない努力がなされた．これについては，使用者各位の懇切な指示に負うものもあった点感謝するところであるが，それとは別に，開巻第 1 ページから順を追うて校訂が進められたのであって，河村重治郎氏はもっぱらその任に当られ，年余にわたって本辞典の内容改善のため尽力された．この改訂にはページの変動増加を来さない範囲という枠がはめられていた．

ところが時日の経過につれて，世界情勢の進展に伴い改訂の項目は増進し新語句・新語義の追加すべきものも急増して来たので，漸く巻末に増補追加の案が台頭したのであるが，その間，当用漢字表・かなづかい法の改正に伴う校訂の業も加わって来た．さらに印刷の面からは金属字を新鋳して版面の面目を一新し，また版面を拡大するという大掛りな改良案も登場するに至った．ここにおいて，終に，なんらの枠を設けない全面的改訂に踏みきることとなり，以来鋭意その業が継続せられ，勉励数年，このたび漸く完成の日を迎えるに至った．

Figure G-13. Sample of Japanese text.



이 辭典을 내면서

우리 나라 英語專門 圖書出版의 외길을 걸어온 弊社가 月刊「時事英語硏究」創刊 20주년 紀念事業으로 지난 15년간 심혈을 기울여 엮어 온「뉴우월드 韓英大辭典」을 出刊하기에 이르렀읍니다. 이「뉴우월드 韓英大辭典」의 편찬 작업은 실로 장구한 세월과 막대한 人力 및 財力을 요한 難産의 大役事였읍니다.

돌이켜보면, 영어도서 전문 출판사로서의 보람과 긍지와 자부심을 가지고 출발했던 폐사로서는 創立 당초부터「英韓」과「韓英」의 두 가지 대사전의 편찬만은 어느 누구에게도 양보할 수 없다는 야심과 우리 힘으로 꼭 완성해야 한다는 使命感을 가지고 우선 1973년에「뉴우월드 英韓大辭典」을 내놓고 좀 더 難航을 거듭한 15년의 노력 끝에 이제야 독자 여러분 앞에「韓英大辭典」의 모습을 보이게 되었읍니다. 우리말의 모든 표현을 英語다운 英語로 옮기는, 실로 創作이나 다름없는 편찬 작업이었기에「韓英大辭典」이「英韓大辭典」보다 5년이나 지각하게 된 셈입니다.

Figure G-14. Shows Korean with fewer Chinese symbols used.

NOTE: North Korean text seldom has any Chinese characters as a matter of official policy.

CHINESE:

Chinese is written with several thousand symbols called characters. International numerals are widely used and scientific and technical Chinese will contain quoted European words in Roman letters. The characters are constructed according to a complex system based on the use of only a few different stroke types (less than 10) and a large set of elements called "radicals" (about 200). Radicals are made up of one or more elements associated with them. These radicals and strokes are used to construct the characters. The characters are thought of as occupying a rectangular space and good calligraphy allots about the same area to each character, regardless of complexity.

Figure G-15 shows the 50 most common radicals in Chinese. Some will occur by themselves as characters. Most will more frequently occur as constituents of more complex characters. The People's Republic of China has recently changed the form of some of these elements, but most are unchanged and the traditional forms still occur even there.

Except for numerical zeroes and the small circles that are used as punctuation marks to indicate the end of a sentence, printed Chinese does not have any circles. If the text has a lot of circles and curves, suspect some language other than Chinese.

Figure G-15. The fifty most common Chinese character radicals.

JAPANESE:

Japanese has a mixed writing system. Like the Chinese, the Japanese normally use international numerals in their S&T literature; but this is not the real reason their writing system is mixed. Japanese writing is mixed because, in general, it uses Chinese characters to write the lexical stem of nouns and verbs (the part of the word that conveys the basic meaning); and a set of phonetic symbols invented in Japan called **hiragana** to write the grammatical affixes of the nouns and verbs as well as entire auxiliary words.

Japanese also use another set of phonetic symbols, also invented in Japan, called **katakana** to write words borrowed from European languages. The presence of these katakana symbols distinguishes Japanese. Normal prose will contain perhaps 60 to 70 percent hiragana symbols. Unlike Chinese characters, hiragana are written with curved strokes. Katakana are less frequent.

The hiragana are illustrated in Figure G-16 and the katakana are illustrated in Figure G-17. Pay particular attention to the fifth symbol from the left in the bottom row of the hiragana (Figure G-16), the one labeled "no." This symbol is used to write a very common grammatical affix. It will almost always occur frequently in any Japanese text.

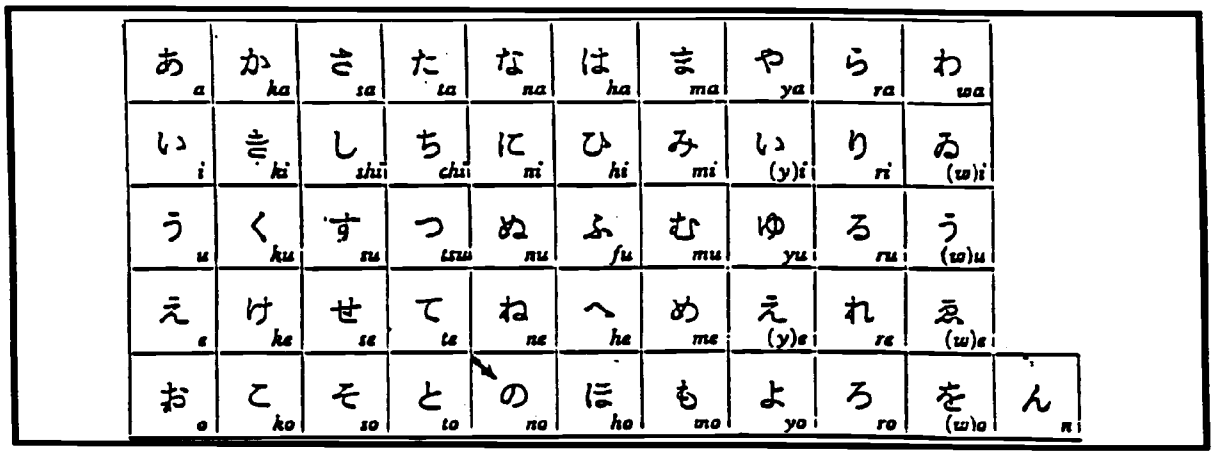


Figure G-16. The Japanese Hiragana syllabary.

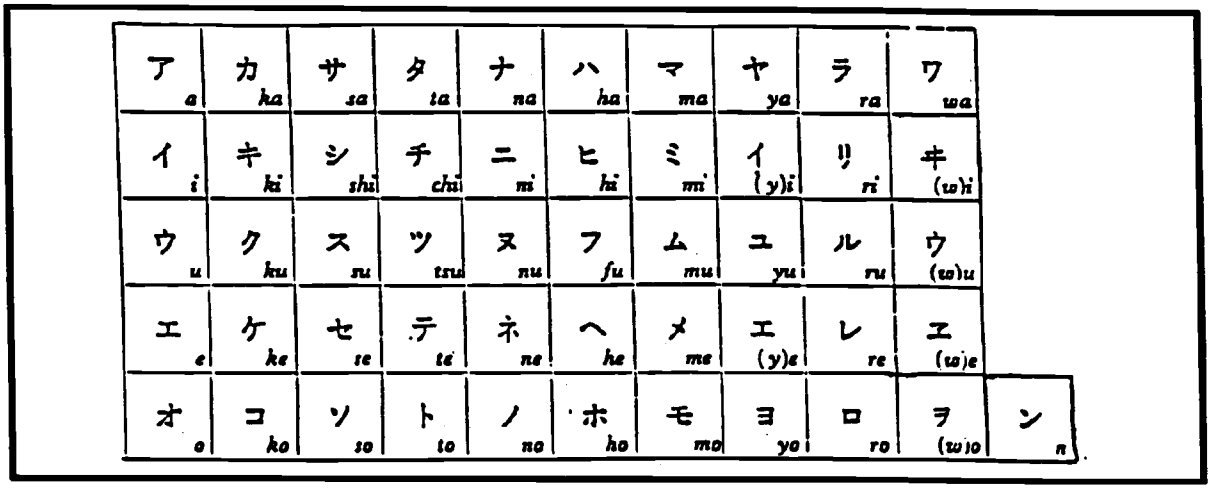

Figure G-17. The Japanese Katakana syllabary.

KOREAN:

Korean can be written entirely in its native alphabet. Therefore, symbols from this script will overwhelmingly predominate in any normal Korean text. Chinese characters, however, are considered learned and prestigious, so a certain number of them will be encountered in quantities that vary with the pretensions of the author.

The Korean alphabet was developed under the influence of Chinese writing models, so to the untrained eye Korean alphabetic writing looks like Chinese characters. The letters of European alphabets form words, but the symbols of the Korean alphabet are grouped together to form a syllable. This means that a Korean word may extend over several groupings.
Also, while the letters of European words are read horizontally, Korean

alphabetic symbols are read vertically—from the top to the bottom of each group—with the left preceding the right when the symbols are side-by-side.

Figure G-18 illustrates the symbols of the Korean alphabet. Pay close attention to the second symbol from the left in the third row, the one that looks like a circle with a stem at the 12 o'clock position. It is a very frequent symbol and does not look like anything that occurs in Chinese or Japanese.

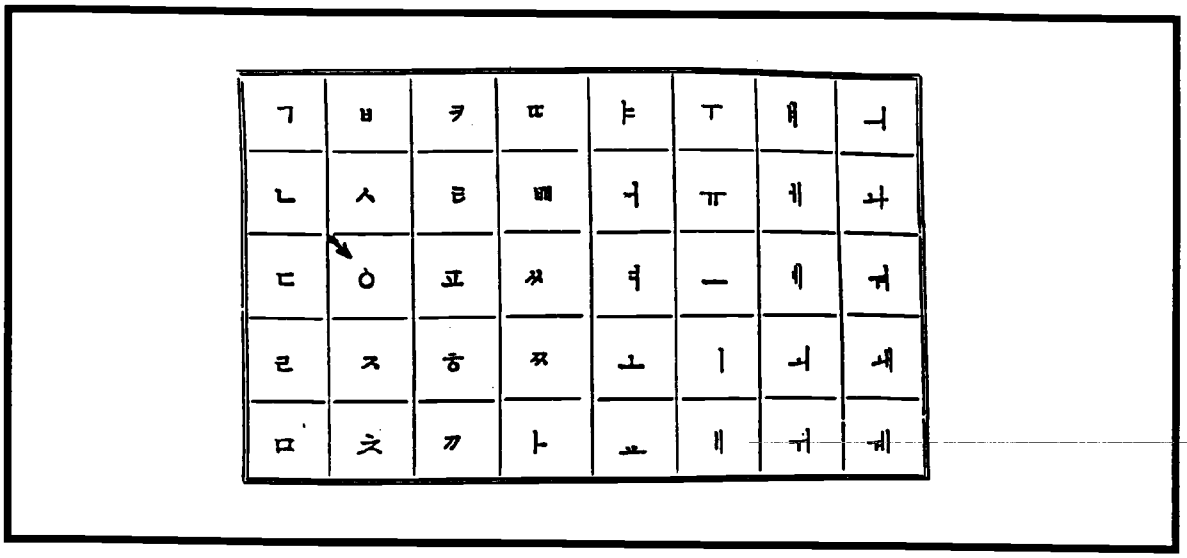

Figure G-18. The Korean alphabet.

Appendix H

CHEMICAL AND BIOLOGICAL WARFARE SAMPLING PROCEDURES

INTRODUCTION

This appendix provides procedures for the safe and expeditious collection, transportation, and receipt of suspected CB agent samples from the integrated battlefield to approved CONUS and OCONUS laboratories for processing, analysis, and identification.

BACKGROUND

During the 1980's, at the time of the Soviet occupation of Afghanistan and the Iran-Iraq War, the ability of US forces to collect and analyze toxic agents was questionable.

In response to this concern, an examination was conducted on the mechanisms in place to preserve the integrity of the suspected CB samples collected on the battlefield.

Procedures for collecting, packaging, documenting, and transporting CB samples to laboratories must be precise to ensure the credibility of the analysis conducted on the samples.

The credible analysis of suspected CB samples is critical for both battlefield commanders concerned with chemical retaliation and contamination avoidance, and medical personnel concerned with prophylactic or post-contamination treatment.

OPERATIONAL CONCEPT

SITUATION:

Current battle doctrine describes a nonlinear battlefield where the Threat NBC weapons are tactically integrated. The principles of NBC reconnaissance and detection and TECHINT teams apply equally across the battlefield.

SAMPLING:

Sampling will be initiated when the following are observed:

- Significant numbers of unexplained sickness or death of personnel or animals occur.
- Ordnance (munitions) are found which contain known or suspected CB agents.
- An attack is suspected or is known to have occurred but the causative agent cannot be identified.
- The widespread outbreak of unusual mission-degrading behavior occurs.
- Sampling of known or identified agents to verify first use is required.

SAMPLING RESPONSIBILITY:

Samples suspected of containing CB agents are divided into environmental and biomedical samples on the basis of their origin. Both medical and nonmedical units and teams have the responsibility for collecting samples suspected of containing CB agents.

- Environmental Samples. Environmental CB agent samples are collected in the field. They include samples of aerosols or vapors, liquids other than water, soil, vegetation, water, used equipment, and ordnance. The acquisition of these samples is the responsibility of—
  - — NBC reconnaissance teams.
  - — TEU field teams.
  - — Preventive medicine units (potable water sources only).
  - — TECHINT collection teams.
  - — Biological Integrated Detection System (BIDS) team.
- Biomedical Samples. Biomedical samples are derived primarily from acutely ill soldiers who exhibit symptoms of CB agent intoxication or from personnel who were killed in an attack. Collection of the biomedical samples will be the responsibility of personnel in—
  - — Battalion-level medical units.
  - — Division-level medical treatment facilities.

- — Combat support hospitals.
- — Evacuation hospitals.
- — NBC reconnaissance teams (small animals only).
- — TECHINT collection teams.
- — BIDS teams.

SAMPLE ACQUISITION

ENVIRONMENTAL SAMPLES:

Responsible personnel for collection:

- Commander, NBC reconnaissance teams.
- Commander, TEU.
  - — Commander, CMEC.
  - — Commander, preventive medicine units.

NOTE: When possible, background samples from "clean" areas beyond the perimeter of the attack site should be obtained as baseline data for comparisons. Collect these identically to samples from contaminated areas and package them separately.

The methodology for collecting environmental samples in order to analyze them for CB-agent presence will be specific for the type of sample (for example, liquid aerosols or vapors, soil, vegetation, water, other liquids, ordnance, equipment). Complete DA Form 1971-6-R for all environmental samples. A sample form is at Figure H-1.

In conjunction with collection of environmental samples, any positive results using the chemical agent detector kits should be recorded on DA Form 1971-6-R. Sampling will be accomplished as instructed. Figure H-2 is an example of an equipment list containing components of a suggested environmental sampling kit. (See FM 3-3.)

Chemical/Biological Specimen Documentation

For use of this form, see FM 3-3; the proponent agency is TRADOC.

INSTRUCTIONS

Place the biological sample inside a refrigerator, ice chest, or insulated container; and keep it as cool as possible at all times.

Specimen Identification Number: 0001

Date and Time Specimen Collected: 121500 JUL 97

Reason for Collection (check those that apply):

- ☑ Chem/Bio Attack
- ☐ Chem/Bio Alarm Activated
- ☐ Positive M256 Chemical Detection
- ☒ Positive Recon Team Findings
- ☐ Soldiers Becoming Sick
- ☐ Soldiers Dying
- ☐ Other _____

Location of Attack DHAHRAN (UTM or place)

Unit Identification BCO, 203d MI BN, 515th MI Bde (Co, Bn, Bde, Div, Corps)

Date and Time of Attack 121345 JUL 97

SAMPLE

Terrain Description (check those that apply):

- ☑ Flat
- ☐ Hills
- ☐ Mountains
- ☐ Desert
- ☐ Jungle
- ☐ Forest
- ☐ Urban
- ☑ Grassy
- ☐ Sparse Trees/Shrubs
- ☐ Other _____

Weather (check those that apply):

- ☐ Clear
- ☑ Cloudy
- ☐ Rain
- ☐ Fog
- ☐ Snow
- ☐ Dust
- ☐ Mist
- ☐ Other _____

Wind at Collection Site (check only one):

- ☐ None/Calm
- ☐ Mild Breeze
- ☑ Windy
- ☐ Gusts

Odor (check those that apply):

- ☐ None
- ☐ Sweet
- ☐ Fruity
- ☑ Irritating
- ☐ Pepper
- ☐ Flower
- ☐ Changing
- ☐ Other _____

Symptoms (check those that apply):

- ☐ None
- ☐ Skin Swelling
- ☐ Difficulty Breathing
- ☐ Blurred Vision
- ☑ Dizziness
- ☑ Skin Rash
- ☐ Nausea
- ☐ Dry Mouth
- ☐ Fever
- ☐ Dark Skin Blotches
- ☐ Unconscious
- ☑ Headache
- ☐ Bleeding Sores
- ☐ Other _____

Symptoms:

Time of Onset: 121400 JUL 97 Duration (of Symptoms): 15 Minutes

DA Form 1971-6-R, AUG 92

Figure H-1. Sample DA Form 1971-6-R (Chemical/Biological Specimen Documentation).

Delivery Method (check those that apply):

☐ Unknown ☑ Artillery ☐ Mortar ☐ RPG/Grenade ☐ Rocket

☐ Aircraft ☐ Aerosol ☐ Generator ☐ Other _____

State of Agent at Time of Collection (check only one):

☐ Liquid ☑ Vapor ☐ Powder ☐ Solid ☐ Smoke ☐ Mist

☐ Dust (cloud) ☐ Gel ☐ Other _____

Description of Sample (check only one):

☐ Vegetation

☑ Soil ☐ Other _____

Biomedical: ☐ Urine ☐ Blood ☐ Tissue

Color of Sample _____

Size of Sample _____

Other _____

Figure H-2. Example of an equipment list.

Contaminated sampling equipment not transported with the sample will be decontaminated and double wrapped in plastic and undergo a sampling protocol to certify the items as "XXX." The XXX refers to decontamination to the point that equipment can be reused, but is not releasable from DOD.

Liquid Aerosol and Vapor Samples:

- Use an electric or hand pump (record the run time for electric pump or number of aspirations for hand pump to determine volume), collect the liquid aerosol remove (LAR) in two Tenax GC-Type Sorbent Tubes.

- Return the sampling tube to the piglette, mark on the outside with a sample identification code and close the ends tightly. Attach a DA Form 1971-6-R. Pack the sample.

Vegetation Samples:

- Collect vegetation which appears in any way to be different from normal, nearby vegetation (for example, discolored or withered vegetation, or vegetation having powder or droplets present).

- Collect vegetation samples at several locations within suspected contaminated areas.

- Cut several affected leaves and/or a handful of grass. Do not crush the sample. Instead, place it in a mylar bag and seal. Collect similar reference vegetation from an unaffected area and place it in a separate mylar bag and seal it. The minimum sample size of value is three leaves or three handfuls of grass. One leaf is of little value (but it is better than nothing). Bark is acceptable but not preferred.

- Mark the bag with a sample identification number.

Soil Samples: Collect samples from areas stained with oils or powders, from areas that are discolored, or from areas that are otherwise different in appearance from the surrounding soil. A similar soil sample from an unaffected area is required for reference (soil of the same type and texture is preferred). The minimum sample volume is approximately that of a cigarette pack laying on its side.

- Use a knife, spoon, spatula, or piece of metal to collect the sample.

- Place the sample in a mylar bag.

- Mark the bag with a sample identification number.

Water Samples: Use the M272 water test kit or other appropriate test kit to determine the presence of chemical agents, record the test results on a DA Form 1971-6-R. Take samples at standing pools or along streams where dead animals are observed.

- Collect bulk water samples (preferred when oily globules or suspended solids are present) as follows:
  - — Skim surface water into Teflon bottle.
  - — Fill the bottle, screw on the top, and ensure that the seal is leak proof with parrafin wax or plumber's antiseize tape.
  - — Mark a sample identification number on the bottle.
- When using the SepPak Cartridge for liquid sampling, consider the following:
  - — The C-18 SepPak cartridge extracts and concentrates contaminants from a water source.
  - — Methanol and distilled water are used to prime the SepPak.
  - — 200 milliliter (mL) of sample water is drawn slowly through cartridge with a 50 mL syringe. Discard liquid and syringe.
  - — The cartridge is placed in a Teflon bottle marked with a sample identification number.
- When obtaining a sample of sludge on the shore or in a shallow bottom, scoop the top of solids with an open bottle; close the bottle and seal it with parrafin wax. Mark the bottle with an identification number.

Packaging Samples: Place several sample bags in one mylar bag. Place the reference samples in a separate mylar bag. Do not overfill. Press excess air from the bag and seal the adhesive end. Seal the package with tape, and mark sample identification numbers. Include the DA Form 1971-6-R.

Packaging Small Animals (Mammals Preferred): Place the animal in a mylar bag, press excess air from the bag, and seal it. Mark the bag with the sample identification number and place the marked bag into a second mylar bag. Press excess air from the bag, seal the adhesive flap, and seal the bag with tape. Mark with sample identification numbers and attach the DA Form 1971-6-R.

Packaging Ordnance or Protective Equipment or Clothing: Prior to approaching or handling any ordnance, exploded or unexploded, contact the EOD unit in the area for assistance. The EOD unit will attempt to identify the ordnance by physical characteristics or markings and render it safe. If the ordnance is CB in origin, EOD will perform initial packing in the

field and transfer the sample to an MI unit for transfer to CONUS. The sample must be marked with a sample identification number and documented with the DA Form 1971-6-R and DD Form 1911.

Protective equipment and clothing from casualties can be an important source of a CB agent for identification purposes. To do this, place the equipment or clothing in a large mylar bag, fold, expel excess air from the bag, and seal it. Mark the bag with a sample identification number. Place the bag in a second mylar bag, seal, and mark with a sample identification number. Then complete and attach the DA Form 1971-6-R. Finally, forward the sample to Technical Intelligence for transfer to Corps G2. Document the transfer on DA Form 3147.

BIOMEDICAL SAMPLES:

Responsible personnel for collecting samples are located in—

- Battalion-level medical units.
- Division-level medical treatment facilities.
- Combat support hospitals.
- Evacuation hospitals.
- TECHINT collection teams. In the theater of operations, the TECHINT teams will have the capability to obtain biomedical samples from patients and cadavers.

The best biomedical sample is an acutely ill soldier sent back to CONUS immediately. DA Form 1971-6-R is to be completed on all biomedical samples. In addition, a copy of the physical examination or an extract of significant findings are to be enclosed with the biomedical samples.

Additionally, the following samples should be collected whenever casualties occur and should be collected in triplicate, distributing two within CONUS and one to the TAML. Once collected, the samples should be refrigerated or chilled immediately. DO NOT FREEZE.

DA Form 1971-6-R will be completed on all biomedical samples. Medical personnel should perform biomedical sample collection to obtain a valid sample.

Use the following guidance to collect samples:

- Collect samples from patients during acute phase and at day 7.

- Collect urine samples (20 to 50 mL per sample x 3) in urine specimen cups, the top secured with wide tape, and placed in individual sealable bags.

- Collect whole blood or serum samples (5 mL per sample x 3) in red-top blood tubes and placed in individual, sealable bags.

- Collect sputum only from acutely ill patients (x 3). They should be collected in urine cups. Secure the cup with wide tape and place in individual sealable mylar bags.

- Collect cerebral spinal fluid (2 mL per sample x 3) in red-top blood tubes and placed in individual, sealable bags.

- Take at least 30 grams of organs and tissues (human, post-mortem x 3), place in a sterile container in individual, sealable bags, and refrigerate immediately: liver, spleen, lung, subcutaneous fat, cerebral spinal fluid, kidney, heart, and brain.

- Collect at least two mediastinal lymph nodes.

- Take animal tissue samples as a lower priority to human samples. Animals should be mammalian (no birds).

- Once critical and significant biomedical samples are identified in OCONUS, these samples should be turned over to the tactical intelligence channel for disposition to appropriate laboratories (CONUS or OCONUS).

- Sample and corroborative information is provided for on DA Form 1971-6-R.

Packaging Biomedical Samples: Place the mylar bags or sample containers in a plastic bag. Remove excess air and seal tightly. Mark the container with a sample identification number. Place 1 to 2 inches of packing material (for example vermiculate or foam) around the sample bag in a rigid container. Wrap jars, tubes, or specimen cups in bubble wrap or other suitable material so they do not move in the container. Place a lid on the container and seal with wide tape. Place a warning on the outside of the container as follows:

DANGER
Do not open. Contains hazardous material or suspected CB agents which may cause immediate death or personal injury.

DISPOSITION OF ENVIRONMENTAL AND BIOMEDICAL SAMPLES:

Place the environmental and biomedical samples in an insulated chest; ensure that the sample is packed tightly and an adequate supply of refrigerant is available. Seal the chest and label accordingly prior to its departure from the OCONUS theater of operation to CONUS.

The procedure should further meet the specifications contained in TM 38-250, paragraph 10-51, for etiologic agents. Document all samples with DA Form 1971-6-R. Number the samples. Units are responsible for forwarding samples through intelligence channels to Corps G2. Document the sample transfer with DA Form 3147. Figures H-3 through H-5 are examples of responsibilities, collection guidelines, and identification and control for a sample evacuation.

SAMPLE EVACUATION

A. RESPONSIBILITY:

1. Field units are responsible for the transfer of samples to MI channels for forwarding to Corps G2. Additional packaging and consolidation of double-contained samples, if required, will be accomplished prior to shipping to CONUS. Complete the sample identification. Document sample transfers on DA Form 3147.

2. Corps or Division surgeons are responsible for coordinating the delivery of samples from MI channels to Corps G2. The Corps and/or Division Surgeon will coordinate with combat units and graves registration units for expedient transfer of personnel deceased as a result of a CB attack to battalion, division, or corps level medical units and hospitals for obtaining biomedical samples. Document the sample transfers on DA Form 3147.

3. Corps G2 is responsible for coordinating shipment of samples to approved CONUS and OCONUS laboratories and the TAML, as well as dispatching the required notification messages. Notification to the US Army Chemical and Biological Agent Technical Evaluation Board (CBATEB) of the acquisition of a sample suspected of containing CB agents is requested within 1 hour of receipt by Corps G2.

Figure H-3. Description of responsibilities for a sample evacuation.

IMPORTANT NOTES

(a) Properly packaged samples do not constitute a hazard to personnel.

(b) All outer packaging is to be inspected visually for physical evidence of leakage or loss of envelope integrity.

(c) DO NOT UNWRAP. Overwrap if any irregularities exist.

(d) If overwrapping is required, provide the time, date, place, and the reason.

(e) Refrigerate or chill (DO NOT FREEZE) all samples.

(f) Delay must be minimized.

(g) All samples will be forwarded from the theater to approved CONUS and OCONUS laboratories and TAML 12 to 24 hours after collection. Delay beyond 24 hours rapidly degrades the operational and intelligence value of the samples. The most efficient means of shipment will be used; address all samples to CBATEB, Aberdeen Proving Ground, MD, and TAML.

B. DOCUMENTATION REQUIRED ON ALL SAMPLES:

1. DA Form 1971-6-R.

2. DA Form 3147.

C. NOTIFICATION MESSAGE: The notification message sent by Corps G2 should be sent as an IMMEDIATE precedence and with appropriate security classification. The action addressee is Technical Director, ERDEC APG MD//CBATEB//. The notification message will contain the sample identification number and details which relate to the acquisition of the sample. The message will be configured to provide the following information:

1. Background information.

2. Physical description.

3. Results of preliminary tests after sample collection.

4. Where, when, and under what conditions the sample was acquired.

Figure H-3. Description of responsibilities for a sample evacuation (continued).

5. Description of incident.

6. Casualty symptoms (if applicable).

7. Shipment information, such as—

   (a) Date of shipment.

   (b) Mode of transportation.

   (c) Flight number and destination.

   (d) Estimated time of arrival CONUS.

   (e) Description of shipment (size, weight, and so forth).

D. NOTIFICATION: Upon receipt of the notification message, the Chairman, CBATEB, is responsible for notifying the appropriate agencies.

Figure H-3. Description of responsibilities for a sample evacuation (continued).

SAMPLE COLLECTION GUIDELINES

1. PROTECT YOURSELF:

   Do not handle contaminated samples with your bare hands. If neoprene gloves are not available, use a stick or other object to move a sample into a container. Respiratory and/or skin protective equipment may also be required.

2. TAKE THE SAMPLE:

   If an area appears to have been contaminated, use whatever field expediency is necessary to get a sample.

3. LABEL THE SAMPLE:

   Once a sample is collected, the container should be labeled immediately so that it is not confused with another sample.

4. PROTECT THE SAMPLE:

   Most environmental and biomedical samples should be sealed and chilled to avoid cross-contamination and decomposition. Samples should not be frozen if possible. Above all, avoid freeze-and-thaw situations.

5. DOCUMENT THE SAMPLE:

   Record the circumstances surrounding the collection of the sample. Data such as how, where, when, why, and by whom is required. Diagrams and maps of areas are useful.

6. FORWARD THE SAMPLE:

   CB samples are time sensitive. They should be reported and forwarded for analysis as quickly as possible (within 12 to 24 hours).

7. PROTECT YOUR SOURCE:

   All transactions involving CBW samples are highly sensitive. All knowledge and information (written and verbal) pertaining to the source are automatically considered SECRET. All samples and associated papers and diagrams, for example, will be released only to individuals known to be cleared and having a need to know; and they will be SIGNED FOR. All samples and associated papers must remain in the physical custody of authorized US persons only.

Figure H-4. Sample collection guidelines.

SAMPLE IDENTIFICATION AND CONTROL

1. Samples acquired by a governmental source or provided by another source must be carefully controlled to be of the greatest value. To accomplish this, physical custody of the sample is maintained by a government representative. A sample identification number is also assigned and affixed to the sample or its container.

2. To prevent confusion, the sample number must be used when referring to the sample or to information concerning its acquisition. A sample number consists of the following elements:

(a) Country of Acquisition. This is a 2-digit alphabetic code for the country in which the sample was collected. The codes are found in DIAM 58-13, Volume II, Section E, dated 28 March 1988.

(b) Date Acquired. DTG sample acquired (local or Zulu time, as directed by higher headquarters).

(c) Sample Sequence Number. This is a 3-digit numerical code which is assigned per collector, and begins each collection day. The first sample collected is 001, the second is 002, and so forth.

(d) Unit Identification Code. UIC of the unit that the collector is assigned to.

(e) Collector Identification. The initials of the collector.

EXAMPLE

LA-12l300Z FEB 90-002-WH60AA-JD

LA	= Sample was acquired in Laos
121300Z FEB 9	= DTG sample was collected
002	= This is the second sample obtained on the date above by the collector
WH60AA	= Unit of assignment of collector
JD	= The sample was collected by John Doe

Figure H-5. Sample identification and control.

Appendix I

FACILITY EXPLOITATION CHECKLISTS

The following sample checklists can be used to guide the actual eyes-on or hands-on exploitation of facilities or to guide the interrogation of EPWs with knowledge of facilities.

COLLECTION CHECKLIST-AIRFIELDS

1. IDENTIFICATION. Local name (both romanized and ideograph) and military designation.

2. LOCATION.

   a. Map reference. Include series and sheet number(s) of both tactical and air-ground series.
   b. Political unit, area, nearest town, and specified reference point (both UTM and geographic coordinates).

3. AIRFIELD CATEGORY. Liaison, surveillance, light lift, medium lift, tactical, or heavy lift.

4. STATUS.

5. TYPE. Civilian, military, or joint.

6. PRINCIPAL USE.

7. LAYOUT.

8. ELEVATION (feet and meters).

9. NUMBER OF RUNWAYS.

10. EACH RUNWAY.

   a. Identification.
   b. Azimuth.
   c. Length and width.
   d. Surface, base, subbase course (material, thickness, and condition).
   e. Longitudinal grade (minimum and maximum change per 100 feet).
   f. Transverse grade (maximum).

Figure I-1. Collection Checklist-Airfields.

g. Shoulders, clear area, and overrun (width, transverse grade, and surface material).
h. Lateral safety zone (width, transverse slope, and obstacles).
i. End clear zones (length, width, and maximum slope).
j. Approach zones (length, width, glide slope, and obstacles).
k. Condition.

11. EACH TAXIWAY.

a. Identification.
b. Azimuth.
c. Length and width.
d. Grade (maximum longitudinal and transverse).
e. Surface, base, subbase material (thickness).
f. Bearing capacity (pounds per square inch).
g. Shoulders and clear area (width, transverse grade, surface, and obstacles).
h. Turn radii.
i. Condition.

12. PARKING AND WARM-UP APRONS.

a. Number.
b. Total area and individual area.
c. Description of each apron.
d. Total capacity (specify aircraft type).

13. HARDSTANDS.

a. Total number.
b. Aircraft capacity (specify).
c. Description of each hardstand.

14. PETROLEUM, OIL, AND LUBRICANTS. Describe facilities and storage.

a. Jet fuel by type (J rating).
b. Aviation gasoline.
c. Jet oil.
d. Aviation oil.
e. Lubricants.
f. Pipelines (cross-reference to pipeline collection file).

15. NAVIGATION FACILITIES. Describe the type of facility.

16. LIGHTING FACILITIES. Describe all lighting at airfield.

Figure I-1. Collection Checklist-Airfields (continued).

17. COMMUNICATION FACILITIES. Cross-reference to communication collection file.

18. MAINTENANCE FACILITIES (aircraft).

19. OXYGEN AVAILABILITY.

20. SPECIAL EQUIPMENT.

    a. Crash and fire.
    b. Construction and ground maintenance.

21. COVERED STORAGE.

22. SANITATION.

23. HANGARS.

    a. Number and locations.
    b. Type and material.
    c. Condition.

24. HOUSING FACILITIES.

    a. Type, location, and number.
    b. Capacity and condition.

25. MUNITIONS STORAGE.

    a. Type and location.
    b. Cubage, normal use, and condition.

26. ADMINISTRATION BUILDINGS (identify).

27. ELECTRICITY. Cross-reference to electric power collection file.

    a. Sources.
    b. Current characteristics.

28. JET STARTING UNITS.

29. AUXILIARY POWER UNITS.

Figure I-1. Collection Checklist-Airfields (continued).

30. ANTI-DETONATION FLUID OR WATER-ALCOHOL.

    a. Type and location.
    b. Quantities.

31. DEFENSES.

32. ADJACENT TERRAIN. Cross-reference to appropriate collection files.

33. MEDICAL FACILITIES.

    a. Type and location.
    b. Capacity and characteristics.

34. WEATHER FACILITIES. Cross-reference to weather collection file.

    a. Type and location.
    b. Characteristics and condition.

Figure I-1. Collection Checklist-Airfields (continued).

COLLECTION CHECKLIST-ELECTRIC POWER

POWERPLANTS

1. IDENTIFICATION. Local name and military designation.

   a. Map reference. Include series and sheet numbers of both tactical and air-ground series.
   b. Political unit, area, nearest town, UTM coordinates, and geographical coordinates.

2. TYPE. Conventional-steam thermal, nuclear-steam thermal, internal combustion-thermal, hydro-turbine storage, hydro-turbine run-of-river, solar, wind, tidal, and so forth.

3. OWNERSHIP. Government or private.

4. FUNCTION. Public utility, industrial, or both.

5. AREA SERVED.

6. PURPOSE. Base load, peak load, or stand-by.

7. STATISTICS.

   a. Total capacity (kW or kVA) and annual production (kWh).
   b. Generators (numbers, type, and rating of each).

8. CURRENT CHARACTERISTICS.

   a. Type (direct current; alternating current).
   b. Generating voltage.
   c. Phase and hertz.

9. OVERALL CONDITION AND AGE.

10. POWERHOUSE CONSTRUCTION. Material, number of stories, windows, and so forth.

11. TRANSMISSION LINE CONNECTIONS. Number and voltage.

12. FUEL DATA (thermal plants only).

   a. Type (by grades).
   b. Quantity used per annum (tons, gallons, cubic feet, pounds, and so forth).
   c. Sources.

Figure I-2. Collection Checklist-Electric Power.

d. Calorific content (conventional-steam).
e. Waste disposal (nuclear-steam).

13. BOILER, REACTOR OR ENGINE DATA (thermal powerplants only).

a. Number, manufacturer, and rating (kW; hp).
b. Cooling facilities (type and source).
c. Steam pressure in psi (conventional-steam only).
d. Efficiency (calories; Btu/kWh) (conventional-steam only).
e. Operating temperature (conventional-steam only).
f. Neutron flux (nuclear-steam only).
g. Shielding and control mechanism (nuclear-steam only).

14. WATER SOURCE, HYDRO-TURBINE POWERPLANTS.

a. Identification.
b. Flow, cubic feet per second (average, minimum, and maximum).
c. Reservoirs (location, volume, area, head, and so forth).
d. Dams (name, location, dimensions, diversion canal).

15. HYDRO-TURBINES (HYDRO-TURBINE POWERPLANTS ONLY).

a. Type, number, and rating (hp).
b. Heat (feet; meters) and Flow (cubic meters per second).

SUBSTATION

1. IDENTIFICATION. Local name and military designation.

2. LOCATION.

a. Map reference. Include series and map sheet numbers of both tactical and air-ground series.
b. Political unit, area, UTM coordinates, and geographic coordinates.

3. TYPE. Transmission, distribution, or industrial.

4. FUNCTION. Switching, transforming, converting, or inverting.

5. OWNERSHIP. Government or private.

6. TRANSFORMERS. Number, capacity (kVA), and voltage ratio (220/110, and so forth).

7. CONVERTERS OR INVERTERS. Number and capacity (kW; kVA).

Figure I-2. Collection Checklist-Electric Power (continued).

8. LINES. Number and voltage (kV).

9. AREA SERVED.

TRANSMISSION LINES

1. LOCATION. (Same as 2 above.)

2. NUMBER OF LINES.

3. OWNERSHIP. Government or private.

4. PLACEMENT. Overhead, underground, submarine cable, and so forth.

5. WIRE CHARACTERISTICS.

6. TYPE OF TOWER. Metal, wood, or concrete.

7. ALIGNMENT AND LENGTH.

8. VOLTAGE (kV).

9. PHASE.

10. MAINTENANCE. Failure causes, effects, and frequency.

Figure I-2. Collection Checklist-Electric Power (continued).

CHECKLIST-PETROLEUM AND NATURAL GAS FIELDS

1. IDENTIFICATION. Local name and military designation.

2. LOCATION.

a. Map reference. Include series and sheet numbers of both tactical and air-ground series.
b. Political unit, area, nearest town, UTM coordinates, and geographic coordinates.

3. OWNERSHIP. Government or private.

4. TYPE. Wet or dry.

5. AREA EXTENT.

6. STATUS. Exploited or unexploited.

7. PRODUCTION. Barrels, tons, cubic feet, per time unit.

8. NUMBER OF PRODUCING WELLS.

9. PERCENTAGE OF NATIONAL PRODUCTION.

10. PRODUCT. Type and characteristics.

11. RESERVES. Proven and unproven.

12. PLANNED EXPANSION. Expected increase, date, and method.

13. TRANSPORTATION.

a. Method (pipeline, railroad, road, water).
b. Identification and destination.

PROCESSING PLANTS

1. IDENTIFICATION. (Same as 1 above.)

2. LOCATION. (Same as 2 above.)

3. TYPE OF PLANT. Complete, skimming, cracking, distilling, synthetic, and so forth (oil or gas).

Figure I-3. Checklist-Petroleum and Natural Fields.

4. OWNERSHIP. Government or private.

5. PERCENTAGE OF NATIONAL REFINING OR CRACKING CAPACITY.

6. YEAR COMPLETED.

7. GENERAL CONDITION.

8. RATED PRODUCTION CAPACITY. Barrels, tons, cubic feet, per time unit.

9. EQUIPMENT.

   a. Number and type.
   b. Rated capacity and condition.

10. OUTPUT. Product, quantity, and quality.

11. POWER SOURCE.

12. WATER SOURCE.

13. TRANSPORTATION.

    a. Raw materials in (identification, method, and origin).
    b. Finished products out (identification, method, and destination).

14. PLANNED EXPANSION.

15. BUILDINGS. Type, number, and characteristics.

STORAGE FACILITIES

1. IDENTIFICATION. (Same as 1 above.)

2. LOCATION. (Same as 2 above.)

3. TYPE. Gas or petroleum.

4. OWNERSHIP. Government or private.

5. TOTAL STORAGE CAPACITY. Barrels, tons, or cubic meters.

6. PERCENTAGES OF NATIONAL TOTAL.

Figure I-3. Checklist-Petroleum and Natural Fields (continued).

7. GENERAL CONDITION.

8. STORAGE TANKS.

9. STORAGE DRUMS.

   a. Manufacturing (location and capacity).
   b. Cleaning and reclamation (location and capacity).
   c. Filling facilities (location, equipment, and capacity).

10. TRANSPORTATION.

    a. In (method and origin).
    b. Out (method and destination).

11. BUILDINGS. Number, type, and characteristic.

Figure I-3. Checklist-Petroleum and Natural Fields (continued).

FACILITY PHYSICAL SECURITY CHECKLIST

1. IDENTIFICATION.

   a. Local and official name.
   b. Functional description.
   c. Local address.
   d. Map reference.
   e. Geographic coordinates.
   f. Additional information.

2. BUILDING DESCRIPTION.

   a. Identification.
   b. Type of construction material.
   c. Type of roof.
   d. Blueprints.
   e. Floor plans.
   f. Description of roof.

      (1) Entrances to building.
      (2) Skylights.
      (3) Air-conditioning ducts.
      (4) Maintenance accesses.
      (5) Elevator shafts.
      (6) Emergency exits and fire escapes.
      (7) Ventilation systems.
      (8) Ladders.
      (9) Additional information.

   g. Entrances to building.

      (1) Main entrance.
      (2) Other entrances or exits.
      (3) Non-standard access points.

   h. Sewage and drainage systems.
   i. Water system.
   j. Interior description of building.

      (1) Floors.
      (2) Corridors.
      (3) Doors.
      (4) Windows.

Figure I-4. Facility Physical Security Checklist.

(5) Locks.
(6) Stairways.
(7) Elevators.
(8) Physical barriers.
(9) Lighting

k. Active security.

(1) Security guards.

(a) Posts.
(b) Arms
(c) Ammunition.
(d) Riot control devices.
(e) Additional information.

(2) Contract watchmen.
(3) National police agents.
(4) Additional information.

l. Communications equipment available.

MODEL	TYPE	NUMBER	LOCATION	FREQUENCY/CHANNELS	ANTENNAS

m. Telephone system.
n. Emergency lighting and power system.
o. Additional information.

3. DESCRIPTION OF GROUNDS.

a. Structures.
b. Entrances to grounds.
c. Perimeter fence.
d. Terrain.
e. Vegetation.
f. Lighting-external.
g. Map or sketch.

4. DESCRIPTION OF SURROUNDING AREA (24 Block Area).

a. Possible observation points.
b. Relative distances of key terrain.
c. Additional information.

Figure I-4. Facility Physical Security Checklist (continued).

5. KEY TERRAIN.

   a. Predominant terrain.
   b. Drop zones.
   c. Landing and Pickup Zones.
   d. Airfields.
   e. Critical lines of communications.
   f. Additional information.

6. MEDICAL CONSIDERATIONS.

   a. Medical staff and facilities.
   b. Civilian hospitals.
   c. Additional information.

Figure I-4. Facility Physical Security Checklist (continued).

CHECKLIST-RAILWAYS

1. IDENTIFICATION. Route designation (native, military, or other) and segment being studied.

2. LOCATION.

a. Map reference. Include series and sheet numbers on both tactical and air-ground series.
b. End points of segment. Political unit, area, UTM coordinates, and geographical coordinates.

3. OWNERSHIP.

4. TOTAL TRACK LENGTH. Double and single tracks in kilometers.

5. END POINTS OF DOUBLE TRACK SECTIONS. Location (UTM) and area name.

6. TRACK.

a. Gage (millimeters).
b. Rails.
c. Roadway (total width and double or single track).
d. Ditches (depth, width, side slope, lining, condition, cross-section, and structures).

7. ROADBED. Material, total width, and width of shoulders.

8. SUBBALLAST. Material and thickness.

9. BALLAST. Material, size, thickness, and condition.

10. TIES. Material, length, width, depth, and spacing.

11. SPACING OF TRACKS. Centerline-to-centerline.

12. RADIUS OF TIGHTEST CURVE. Location (UTM) and radius.

13. MAXIMUM GRADE. Direction of travel and location.

14. BRIDGES. Cross-reference to bridge collection file.

a. Total number of bridges in segment.
b. Total length of bridging in segment.

Figure I-5. Checklist-Railways.

15. FERRIES. Cross-reference to ferry collection file.

16. TUNNELS, GALLERIES, AND SNOW SHEDS (TGSS). Cross-reference to TGSS collection file.

17. UNDERPASSES. Cross-reference to bridge collection file.

18. MINIMUM CLEARANCES. Horizontal and vertical.

19. AXLE LOAD LIMIT. Metric tons.

20. CULVERTS. Location (UTM) and total number, type, construction material, and bypasses.

21. ELECTRIFICATION.

a. End points of electrified sections (UTM).
b. Power feed (overhead or third rail).
c. Current characteristics (direct current; alternating current).
d. Source of power.

22. MAINLINE JUNCTIONS. Location (UTM), identification of connecting line, and type switch.

23. CROSSOVERS. Location (UTM) and type of switch.

24. PASSING SIDINGS. Locations (UTM), number, double-end or single-end, length, and type of turn.

25. STATIONS.

a. Location (local name and UTM coordinates).
b. Function (passenger, freight, or both).
c. Facilities.

26. FREIGHT-HANDLING FACILITIES.

a. Location (local name and UTM coordinates).
b. Side-loading platforms (number and length).
c. End-loading bays.
d. Sidings with access roads.
e. Freight sheds.

Figure I-5. Checklist-Railways (continued).

f. Turntables (number and diameter).
g. Cranes (type, number, and capacity).

27. YARDS.

a. Location (local name and UTM coordinates).
b. Function (receiving, classification, departure, storage, and so forth).
c. Hump or flat.
d. Number of tracks.
e. Fuel facilities (type of fuel, quantity normally on hand, and maximum storage capacity).
f. Other facilities (water, sand, compressed air, and so forth).
g. Electrification (overhead or third rail).

28. FUEL FACILITIES.

a. Location (local name and UTM coordinates).
b. Type of fuel.
c. Type of storage and capacity.
d. Quantity of fuel normally on hand.
e. Method of loading.

29. REPAIR SHOPS AND LOCOMOTIVE TERMINALS.

a. Location (local name and UTM coordinates).
b. Engine house or turntable.
c. Service facilities.

30. WATERING FACILITIES.

a. Location (local name and UTM coordinates).
b. Source and type of storage.

31. SIGNALS AND TRAIN CONTROL. Location (UTM) and type.

32. CRITICAL POINTS.

a. Type (points subject to rock slides, snow slides, flooding, or subject to interdiction and ambush).
b. Location (local name and UTM coordinates).

33. USE. Average number of trains per day (both passenger and freight).

Figure I-5. Checklist-Railways (continued).

34. SECTIONS IN NEED OF REPAIR. Location and nature of repair, and effort required to repair.

35. CONSTRUCTION, MAINTENANCE, AND REPAIR EQUIPMENT.

    a. Type and characteristics of equipment.
    b. Location of park where kept (UTM coordinates).

36. MAINTENANCE SCHEDULE.

37. PLANNED EXTENSIONS AND IMPROVEMENTS.

38. MAINTENANCE AND CONSTRUCTION STANDARDS.

39. SAFETY AND SECURITY STANDARDS.

40. ROLLING STOCK.

Figure I-5. Checklist-Railways (continued).

CHECKLIST-UNDERGROUND FACILITIES

1. IDENTIFICATION. Native name, military designation, and tunnel number.

2. LOCATION OF PORTALS.

a. Map reference. Include series and sheet numbers of both tactical and air-ground series.
b. Political unit, kilometer points, UTM coordinates, and geographic coordinates.
c. Landmark reference. Description and location of landmark, and azimuth and distance from landmark to nearest portal.

3. LENGTH (portal to portal).

4. TYPE. TGSS.

5. CROSS-SECTION.

a. Shape (semicircular, elliptical, horseshoe, square with arched ceiling).
b. Width of traveled way.
c. Width at widest part.
d. Height of widest part.
e. Height of ceiling at center.
f. Height of ceiling at edge of traveled way.
g. Rise of arch.

6. CONSTRUCTIONS (HORIZONTAL AND VERTICAL). Type, least clearance, and location (meters from nearest portal).

7. RAILROAD TRACKS.

a. Number for which tunnel was designed.
b. Number in use.
c. Gage.
d. Center-to-center spacing.
e. Cross-reference to railway collection file.

8. HIGHWAY.

a. Wearing surface (material, thickness, and condition).
b. Base course.
c. Subgrade.
d. Cross-reference to highway collection file.

Figure I-6. Checklist-Underground Facilities.

9. CHANNEL (water tunnels).

    a. Cross-section dimensioned.
    b. Sides (material and thickness).
    c. Bottom (material and thickness).
    d. Normal depth.
    e. Normal current velocity.

10. ALIGNMENT.

    a. Horizontal (position, curve radius, and curve location).
    b. Vertical (grade percent, length, and location).

11. NUMBER OF MANWAYS. Dimensions and spacing.

12. OBSTACLE TUNNELED.

13. PORTAL. Design and material.

14. LINING MATERIAL. Type, thickness, condition, and points of change.

15. SHORING AND BRACING.

    a. Location and spacing.
    b. Design.
    c. Materials.
    d. Dimensions of members.
    e. Arrangement and spacing of members.

16. STRUCTURAL DESIGN, MATERIALS, AND DIMENSIONS OF GALLERIES AND SNOWSHEDS.

17. GEOLOGICAL DATA.

    a. Material through which tunnel passes.
    b. Geology of adjacent areas.

18. OVERHEAD COVER. Material and depth.

19. DEMOLITION CHAMBERS. Location and dimensions.

20. VENTILATION. Description and adequacy.

Figure I-6. Checklist-Underground Facilities (continued).

21. DRAINAGE. Description, location, and adequacy.

22. LIGHTING FACILITIES. Type, location, and power source.

23. YEAR COMPLETED.

24. BYPASSES. Location, condition, effort required to establish.

25. ALTERNATE ROUTES. (Cross-reference to highway collection file).

26. TRAFFIC CONTROL MARKINGS.

27. APPROACHES. Characteristics, grade, surface, curves, turnouts, and parking areas.

28. SURFACE FEATURES OVER TUNNELS. Vegetation, structures, and surface configuration.

29. EFFECTS OF CLIMATE AND WEATHER.

a. Snow blockage (probable occurrence, effects, and duration).
b. Flooding (periods of occurrence, effects, and duration).

30. SPECIAL GEOPHYSICAL PHENOMENA.

31. SUSCEPTIBILITY TO ABOVE-GROUND DEMOLITIONS.

32. CAMOUFLAGE AND DEFENSES.

33. PRESENT USE.

Figure I-6. Checklist-Underground Facilities (continued).

GLOSSARY

ACRONYMS

AC	Active Component
ACE	analysis and control element
ACOM	US Atlantic Command
ADA	air defense artillery
ADP	automated data processing
AFACSI	Air Force Assistant Chief of Staff for Intelligence
AFMIC	Armed Forces Medical Intelligence Center
AL	Alabama
AMB	aviation maintenance battalion
AMC	US Army Materiel Command
ammo	ammunition
APG	Aberdeen Proving Ground
ARAT	Army Reprogramming Analysis Team
ARCENT	US Army Central Command
ASP	ammunition supply point
ATGM	antitank guided missile
ATP	ammunition transfer point
Aug	August
AVIM	aviation intermediate maintenance
AWACS	Airborne Early Warning
AZ	Arizona
BDA	battle damage assessment
BIDS	Biological Integrated Detection System
bn	battalion
BOS	battlefield operating system
Btu	British thermal unit
C^3I	command, control, communications, and intelligence
CA	Civil Affairs
CB	chemical and biological
CBATEB	US Army Chemical and Biological Agent Technical Evaluation Board
CBDCOM	Chemical and Biological Defense Command
CCIR	commander's critical information requirements
C-E	communications-electronics
CED	captured enemy document
CEE	captured enemy equipment
CEM	captured enemy materiel
CENTCOM	US Central Command
CHATS	CI/HUMINT Automation Tool Set
CI	counterintelligence
CINCLANT	Commander in Chief, Atlantic
CJCMEC	Combined Joint Captured Materiel Exploitation Center
CJTF	Commander, Joint Task Force
CM&D	collection management and dissemination
CMEC	Captured Materiel Exploitation Center
COMTECHREP	Complementary Technical Intelligence Report
COMMZ	communication zone
CONUS	continental United States
COSCOM	Corps Support Command
CSA	corps storage area
CSD	contingency support detachment
CSS	combat service support
CWCC	Centralized Weapons Collection Center
DA	Department of the Army
DARPA	Defense Advanced Research Projects Agency
DCSINT	Deputy Chief of Staff, Intelligence
DCSOPS	Deputy Chief of Staff for Operations
DETECHREP	Detailed Technical Report
DHS	Defense HUMINT Service
DIA	Defense Intelligence Agency
DIAM	Defense Intelligence Agency Manual

DISCOM	Division Support Command
DISE	Deployable Intelligence Support Element
div	division
DMSO	division medical supply officer
DOD	Department of Defense
DOCEX	document exploitation
DOS	disk operating system
DSNET	Defense Secure Network
DTG	date-time group
DTO	district transportation officer
EA	electronic attack
EAC	echelons above corps
EACIC	echelons above corps intelligence center
ECB	echelons corps and below
ELECTRO-OPTINT	electro-optical intelligence
EOD	explosive ordnance disposal
EODTIC	Explosive Ordnance Disposal Technical Information Center
EP	electronic protection
EPW	enemy prisoner of war
ERDEC	US Army Chemical Research Development and Engineering Center
EW	electronic warfare
EXCEN	exploitation center
FSAC	Fire Support Armaments Center
FMA	foreign materiel acquisition
FME	foreign materiel exploitation
FMEP	Foreign Materiel Exploitation Program
FMMEP	Foreign Medical Materiel Exploitation Program
FMIB	Foreign Materiel Intelligence Branch
FMP	Foreign Materiel Program
FMT	Foreign Materiel for Training
FPB	Force Projection Brigade
G1	Assistant Chief of Staff, G1, Personnel
G2	Assistant Chief of Staff, G2, Intelligence
G3	Assistant Chief of Staff, G3, Operations
G4	Assistant Chief of Staff, G4, Logistics
G5	Assistant Chief of Staff, G5, Civil Affairs
HERA	High Explosive Rocket Assist
HHC	headquarters and headquarters company
HOTAS	hands on throttle and stick
HQDA	Headquarters, Department of the Army
hp	horsepower
HUD	heads-up display
HUMINT	human intelligence
I&W	indications and warnings
IEW	intelligence and electronic warfare
IFF	identification, friend or foe
IIR	intelligence information report
IMEP	International Materiel Evaluation Program
IMINT	imagery intelligence
inf	infantry
INSCOM	US Army Intelligence and Security Command
IPB	intelligence preparation of the battlefield
IPC	intermediate processing center
IR	information requirements
IRSTS	infrared search and track set
J1	Assistant Chief of Staff, J1, Personnel
J2	Assistant Chief of Staff, J2, Intelligence
J3	Operations Directorate
J4	Logistics Directorate
J5	Joint staff plans and policy
J6	Communications-Electronic Directorate
JCMEC	Joint Captured Materiel

	Exploitation Center
JDISS	Joint Deployable Intelligence Support System
JIC	Joint Intelligence Center
JTF	Joint Task Force
JTIB	Joint Technical Intelligence Branch
Kb	kilobyte
kV	kilovolt
kVA	kilovoltampere
kW	kilowatt
kWh	kilowatthour
LAR	liquid aerosol remove
LIDAR	laser detection and ranging
LNE	liaison element
LNO	liaison officer
LOS	line-of-sight
MACOM	major Army command
MASINT	measurement and signature intelligence
MCC	movement control center
MCO	movement control office
MD	Maryland
MDR	MASINT data requirements
mech	mechanized
med	medical
MEDLOG	medical logistic battalion
MEDSOM	medical, supply, optical, and maintenance
MEF	Marine Expeditionary Force
MFD	multifunctional display
MI	military intelligence
mL	milliliter
MMC	materiel management center
MOS	military occupational specialty

XO	Executive Officer

TERMS AND DEFINITIONS

acoustic intelligence	Intelligence derived from the collection and processing of acoustic phenomena.
captured enemy document	Documents captured from the enemy.
captured enemy equipment	Equipment captured from the enemy.
captured enemy materiel	The combination of documents, equipment, and material captured from the enemy.
Class I	Subsistence items and gratuitous health and welfare items (B-rations; meals, ready to eat; fresh fruits; and vegetables).
Class II	Equipment, other than principal items, prescribed in authorization and allowance tables (individual equipment, clothing items, tentage, tool sets, administrative supplies, housekeeping supplies).
Class III	POL, which are petroleum fuels, hydraulic and insulating oils, chemical products, antifreeze compounds, compressed gases, and coal. Class III (bulk) is normally fuel; for example, diesel, motor gasoline, and aviation fuel. Class III (package) is other elements such as lubricants, antifreeze, and fog oil.
Class IV	Construction and barrier materials (lumber, sandbags, and barbed wire).
Class V	Ammunition (small-arms ammunition, artillery rounds, hand grenades, explosives, mines, fuzes, detonators, missiles, and bombs, including special ammunition—chemical and nuclear rounds).
Class VI	Personal demand items; the items that are normally sold through the exchange system

	(cigarettes, candy, soap, and so forth, contained in ration supplemental sundries packs).
Class VII	Major end items (final combinations of items that are assembled for their intended use: vehicles, self-propelled artillery pieces, missile launchers, and major weapon systems—the weapons themselves, not the crews).
Class VIII	Medical material (medicines, stretchers, surgical instruments, and medical equipment repair parts).
Class IX	Repair parts and components, including kits and assemblies, and items required for maintenance support of all equipment (batteries, spark plugs, and axles).
Class X	Material required to support nonmilitary programs; the items used to support CA operations (commercial design tractor for use by local civilians, farms tools, and so forth).
combined operations	Operations conducted by forces of two or more allied nations acting together for the accomplishment of a single mission.
communications intelligence	Technical and intelligence information derived from foreign communications by other than the intended recipients. Also called COMINT.
etiologic agent	The cause of a disorder or disease as determined by medical diagnosis.
electro-optical intelligence	Intelligence other than signal intelligence derived from the optical monitoring of the electromagnetic spectrum from ultraviolet (0.01 micrometers) through far infrared (1,000 micrometers). Also called ELECTRO-OPTINT. The collection, processing, exploitation, and analysis of emitted or reflected energy across the optical portion (infrared, visible, and ultraviolet) of the electromagnetic spectrum.
foreign materiel	The all-encompassing term for the weapons

	systems, equipment, apparatus, documents, and supplies of a foreign military force or nonmilitary organization.
Foreign Material Program	The Army program for exploiting, developing, or providing foreign military materiel, commercial representations of foreign materiel with potential miliary application, related foreign documents in the Army inventory, and exploitation reports on this materiel of value to US intelligence, RDTE, and military planning, operations, and training. This includes planning concerning intelligence and non-intelligence acquisition requirements, management of signature and simulator programs, participation in evacuation efforts, and support to the Opposing Forces Program.
joint operations	The integrated military activities of two or more service components—Army, Navy, Air Force, Marine Corps—of the US military.
measurement and signature intelligence	S&TI information obtained by quantitative and qualitative analysis of data (metric, angle, spatial, wavelength, time dependence, modulation, plasma, and hydromagnetic) derived from specific technical sensors for the purpose of identifying any distinctive features associated with the source, emitter, or sender and to facilitate subsequent identification and/or measurement of the same. Also called MASINT.
materials	Raw substances, scrap, semifinished and finished; supplies.
materiel	All items (including ships, tanks, self-propelled weapons, aircraft, and so forth, and related spares, repair parts and support equipment, but excluding real property, installations, and utilities) necessary to equip, operate, maintain, and support military activities without distinction as to its application for administrative or combat purposes.

medical intelligence	That category of intelligence resulting from collection, evaluation, analysis, and interpretation of foreign medical, bio-scientific, and environmental information which is of interest to strategic planning and to military medical planning and operations for the conservation of the fighting strength of friendly forces and the formation of assessments of foreign medical capabilities in both military and civilian sectors.
nuclear intelligence	Intelligence information derived from the collection and analysis of radiation and other effects resulting from radioactive sources. Also called NUCINT.
radar intelligence	Intelligence derived from data collected by radar. Also called RADINT.
scientific and technical intelligence	The product resulting from the collection, evaluation, intelligence analysis, and interpretation of foreign scientific and technical information which covers: a. foreign developments in basic applied research and in applied engineering techniques; and b. scientific and techical characteristics, capabilities, and limitations of all foreign military systems, and materiel, the research and development related thereto, and the production methods employed for their manufacture. Also called S&TI.
technical intelligence	Intelligence derived from exploitation of foreign material, produced for strategic, operational, and tactical level commanders. Technical intelligence begins when an individual service member finds something new on the battlefield and takes the proper steps to report it. The item is then exploited at succeedingly higher levels until a countermeasure is produced to neutralize the adversary's technological advantage. Also called TECHINT.
unintentional radiation intelligence	Intelligence derived from the collection and analysis of noninformation-bearing elements extracted from the electromagnetic energy unintentionally emanated by foreign devices, equipment, and systems, excluding those

generated by the detonation of nuclear weapons. Also called RINT.

The National Defense Intelligence College supports and encourages research on intelligence issues that distills lessons and improves Intelligence Community capabilities for policy-level and operational consumers

Critical Thinking and Intelligence Analysis, Second Printing (with revisions)
David T. Moore

This series of Occasional Papers presents the work of faculty, students and others whose research on intelligence issues is supported or otherwise encouraged by the National Defense Intelligence College (NDIC) through its Center for Strategic Intelligence Research. Occasional Papers are distributed to Department of Defense schools and to the Intelligence Community, and unclassified papers are available to the public through the National Technical Information Service (www.ntis.gov). Selected papers are also available through the U.S. Government Printing Office (www.gpo.gov).

This work builds on earlier publications in this series, particularly Occasional Papers Two, Six, and Seven; *Getting Intelligence Right: The Power of Logical Procedure*, *Intelligence Essentials for Everyone*, and *Intelligence Analysis in Theater Joint Intelligence Centers: An Experiment in Applying Structured Methods*. The author's insights have been developed through years of creative interaction with the Community's leaders in analytic methododology, and tested for practicality by successive waves of students in training and education courses throughout the Community.

Proposed manuscripts for these papers are submitted for consideration to the NDIC Press Editorial Board. Papers undergo review by senior officials in Defense, Intelligence and civilian academic or business communities. Manuscripts or requests for additional copies of Occasional Papers should be addressed to Defense Intelligence Agency, National Defense Intelligence College, MC-X, Bolling AFB, Washington, DC 20340-5100.

This publication has been approved for unrestricted distribution by the Office of Security Review, Department of Defense.

Preface

The world in which intelligence analysts work has changed dramatically over the 67 years since the beginning of the Second World War. Adversaries have shifted from large armies arrayed on battlefields to individuals lurking in the shadows or in plain sight. Further, plagues and pandemics, as well as floods and famines, pose threats not only to national stability but even to human existence. To paraphrase a Chinese curse, we certainly live in interesting times.

Our times demand fresh, critical reasoning on the part of those tasked to assess and warn about threats *as well as those tasked to act on those threats*. Education in the bases and practices of intelligence foraging and sensemaking – often called intelligence collection and analysis – is a means by which this can be accomplished. Indeed, the Intelligence Reform and Terrorism Prevention Act of 2004 legislates improved education for intelligence analysis. But, that education is not specifically defined. This volume provides a framework for one area of the act's educational requirement: improving how analysts think – and by extension, how policymakers act. It asserts that people who are skilled critical thinkers are better able to cope with interesting times than those who are not.

The model for thinking developed here also provides specific tools for coping with accelerating disruptive technologies. Such technologies routinely appear in the hands of adversaries. They also offer intelligence professionals capabilities to counter adversaries in novel ways. The key is knowing which technologies are truly disruptive in advance, which pose threats, and which can be harnessed to mitigate threats. Critical thinking – as it is here defined and developed – provides part of the solution as it encourages careful consideration of the available evidence, close examination of presuppositions and assumptions, review of the alternate implications of decisions, and finally, discussion of alternative solutions and possibilities. In short, it equips intelligence professionals with an essential tool for their work.

Foreword

Mark M. Lowenthal
Former Assistant Director of Central Intelligence
for Analysis and Production
President, Intelligence & Security Academy, LLC

Some years ago, when I worked at the Congressional Research Service, my colleague next door had a sign in his office: "Thinking is hard work. That's why so few people do it." Indeed. As sentient beings we think all the time. Our waking, conscious hours are full of thoughts: what to wear; what to eat; how to respond to someone. These all take thought. One might venture to say that we think almost unconsciously through most of our day.

And then there is that *other* thinking: Thinking about the conundrums that we face, the alternatives and choices we have to make on larger issues, the dilemmas we wish to resolve. This *is* hard work. And if the work you do is largely intellectual in nature, then you are thinking that much more often about these more difficult problems. This is not to suggest that those who work with their hands or in crafts or industry do not think. Of course they do. But these people, in the end, have something physical to show for their thought and its execution. Intellectuals only have their thoughts to show, presumably expressed for others in some way.

Intelligence officers are engaged in an intellectual pursuit. They are trying to solve puzzles, resolve uncertainties, discover the nature and meaning of things that others would keep secret. They must have an entire intellectual apparatus to help them identify the problem, assess the parts they know and the parts they do not, come up with an explanation of what is going on and then express it in a way that others – including an audience not steeped in their own techniques – can understand.

As one would expect, the Intelligence Community has spent a fair amount of time thinking about how it does analysis. But most of this has been spent on techniques, presentation and outcomes; much less has been spent on what happens intellectually while you are thinking. That, indeed, is what critical thinking is about: the ability to step out of one's thoughts, if you will, to examine them and the process that brought them about even while you are thinking them. It does not require some higher level of cosmic consciousness or a split personality. It does require training and thought! So now we are thinking about our thinking while we are thinking – a mental triple play, if you will. This is no mean feat and it is a very crucial skill for intelligence analysts.

John McLaughlin, a former Deputy Director of Central Intelligence, has observed that one of the major perceptions that separates intelligence officers from the policy makers is that policy makers tend to be optimists, believing they can get things done, while intelligence officers tend to be skeptics, knowing that little is known with certainty. Like everyone else, however, intelligence analysts can be adamant about their conclusions, understanding the path they took to reach them, and well-satisfied that they have done the right work and come to the right end. That is where critical thinking comes in. The ability to examine how you came to your conclusion is an important adjunct to your other intellectual work. You may be certain or you may not – which is also acceptable. But you owe it to yourself and to your readers to have examined how you got there.

This is not as easy as it sounds for intelligence analysts for the simple reason that they are usually very pressed for time. There are not a lot of lulls in the analyst's work week, which makes it very difficult to be introspective. This means that critical thinking ought to be something that is ingrained in analysts as part of their training, so that it becomes reflexive. But to do that, one must first understand critical thinking – what it is, how to do it, how to teach or learn it. That is the outstanding value of this monograph by David Moore.

The Intelligence Community is filled with people happily working away under a cloak of anonymity, satisfied in making their contribution to part of a larger activity about which very few beyond their immediate circle of co-workers will know. David Moore has long been one of these contributors. In addition to his duties as an intelligence officer at the National Security Agency, David Moore has devoted many fruitful hours to the intellectual underpinnings of intelligence, especially to what makes analysts and what makes better analysts. His work on analytic core competencies, written with his colleague Lisa Krizan, is a fascinating dissection of the intellectual attributes that make up an intelligence analyst. It was also a very influential work, becoming a prime motivator in the creation of the Analytic Resources Catalog created under Director of Central Intelligence George Tenet and now much touted by Director of National Intelligence John Negroponte.

This new monograph on critical thinking will serve a similar purpose. Much has been written in the last five years about intelligence and about the errors that it can make. Some of this has been diagnostic; much of it has been blithely condemnatory. Prescriptions about connecting dots better (an absurd metaphor), about the need to share information better and alarms about groupthink do not get us closer to improvements in the art, craft and profession of intelligence. New ways of thinking about our profession, new ways of doing our work and new ways of assessing it will be useful. Critical thinking needs to be at the top of this list of desiderata.

I would like to believe that we are on the verge of a renaissance in intelligence studies, and more specifically in the intellectual basis of intelligence analysis. There are many straws in the wind: discussions about a national intelligence university and a lessons learned center, more schools offering serious courses about intelligence and books like this. Critical thinking is and should be critical for all analysts and they will profit from this book.

Commentary:

Jeffrey R. Cooper
SAIC Technical Fellow
Science Applications International Corporation

David Moore has written an elegant and largely persuasive argument for the Intelligence Community to move forthrightly and adopt critical thinking in order to improve the quality both of its analytic processes and its intelligence judgments. Since I have recently written about the need for the Community to identify and cure deep-seated and systemic "analytic pathologies," I am obviously sympathetic to the general case for incorporating more rigorous analytic processes—among which "critical thinking" is one attractive approach.[1] Along with Moore, I also believe strongly that the traits often associated with critical thinking need to become fundamental characteristics of every analyst and to be practiced consistently in their work habits. Moore discusses these aspects at some length and highlights their value to making sounder judgments.

In doing so, he makes a compelling case that critical thinking can help analysts reshape their methods in ways that help to avoid damaging errors and enhance judgment. He and I agree with Rieber and Thomason that we should validate the potential improvement before widespread deployment.[2] The need for validation raises some related points concerning the criteria for evaluation and measurement. As Philip Tetlock has noted, on the one hand, one can do evaluation by assessing whether a process (assumed to be good) has been followed; one the other hand, one can also assess

1 Jeffrey R. Cooper, "*Curing Analytic Pathologies: Pathways to Improved Intelligence Analysis*" (Washington, DC: Central Intelligence Agency, Center for the Study of Intelligence, 2005). Cited hereafter as Cooper, *Pathologies*.

2 Steven Rieber and Neil Thomason, "Toward Improving Intelligence Analysis: Creation of a National Institute for Analytic Methods," *Studies in Intelligence* 49, no. 4 (Winter 2006), 71.

quality by looking at the products themselves.[3] However, following a good process does not guarantee good products, nor does a good judgment necessarily validate the quality of the analysis or the analyst. Both approaches have flaws as methods of validation.

I urge the leadership of the Intelligence Community to place far more emphasis on structured analytic methods. In my view, the transformation of the intelligence enterprise demands a more curious, more agile, and more deeply thoughtful cadre of intelligence analysts—but it should also require the same traits among its intelligence organizations and the intelligence enterprise as a whole. Moore notes that "Investment in critical thinking as part of the analysis process minimizes the likelihood of specific failures" (page 81). However, from my perspective, critical thinking (and other structured methods) are more important for changing the organization's overall approach to analysis, rather than in improving specific judgments or preventing particular failures.

I believe such methods are crucial in preventing systemic analytic pathologies from developing, exactly because the Community lacks many of the desirable self-corrective mechanisms found in science. Second, while Moore focuses on the role of critical thinking in improving an individual analyst's ability to make good judgments, my view emphasizes the importance of more rigorous processes for the organization as a whole if it is to improve its capacity to meet user needs. Indeed, given my emphasis on the systemic nature of the pathologies that afflict intelligence analysis, structured analytic methods become a first line of defense in preventing networks of errors—they are like "ripstops" that keep problems from propagating into wider "error-inducing systems," in Perrow's terms. The quality of "mindfulness" and a more self-reflective process are essential if the intelligence organizations are to acquire some of the desirable characteristics of high-reliability organizations. While critical thinking can clearly assist individual analysts, and these "memes" can be spread through viral dissemination, I would place far more emphasis on fomenting social and organizational changes as remedies.

---

3 Philip E. Tetlock, *Expert Political Judgment: How Good Is It? How Can We Know?* (Princeton, NJ: Princeton University Press, 2005).

Finally, exactly because Moore focuses so tightly on the value of critical thinking to improve how individual analysts reason, he largely ignores the important role such habits should, and could, play in the "social construction" of intelligence analysis *and its communication to users of that intelligence*. The use of more structured techniques "to present more effective assessments" should go beyond simply convincing policymakers "to question their own assumptions on the issues" (page 80). By restructuring both the analytic process and the modalities of interactions with policy users, critical thinking techniques can draw policy users into "co-creating" important judgments and, by doing so, get them to adopt some of the important attributes of critical thinking. This internalization would be more powerful than hoping the exquisite brilliance of the improved analytic judgments might make them more palatable.

These minor quibbles aside, David Moore has highlighted for the Intelligence Community and its users some tangible methods for improving intelligence analysis and addressing systemic analytic pathologies.

Commentary

Francis J. Hughes
Professor, National Defense Intelligence College

> The truly difficult problems of the information age are not technological; rather, they concern ourselves – what it is to think, to reason, and to engage in conversation [using] … new analytic techniques, new conceptual tools with which to analyze and understand the workings of the human mind.
>
> —Keith Devlin, *Goodbye Descartes: The End of Logic and the Search for a New Cosmology of the Mind*, 1997

David Moore has undertaken a valuable initiative on behalf of the Intelligence Community by producing this monograph on critical thinking. In doing so, he has addressed the concerns of Keith Devlin and many other scholarly writers on the subject of human reasoning. By contextualizing the concept and practices of critical thinking within intelligence analysis, he has set forth a much-needed cognitive linkage between intelligence analysis and the human thought process, which, as he states, remains otherwise "poorly understood."

Mr. Moore has developed a methods-of-thinking course, outlined in the Appendix to this paper, which should guide the collection of evidence, the reasoning from evidence to argument, and the application of objective decision-making judgment. Critical thinking in intelligence depends primarily on a conscious application of suitable habits of thought, and the course certainly promises to advance the education of intelligence professionals.

Commentary

Gregory F. Treverton
RAND Corporation
Former Assistant Director of Central Intelligence for
Analysis and Production
and Vice-Chairman, National Intelligence Council

David Moore has added his powerful voice to those calling for America's intelligence analysts to be more self-conscious about their methods and more venturesome in applying more formal methods. His starting point is critical thinking, but his strong case embraces a range of techniques from Paul and Elder's checklist, to analysis of competing hypotheses (ACH), to Factions analysis, which is really a way to be more systematic in aggregating subjective judgments, to techniques such as those developed by the Novel Intelligence from Massive Data (NIMD) project. These help analysts search for patterns and test hypotheses. Moore's discussion pays particular attention to critical thinking about *evidence* – that is perhaps natural given that the National Security Agency is his home agency, but it is also a welcome emphasis.

My own explorations of the analytic agencies over the last few years confirm my own experience managing the National Intelligence Council (NIC): In general, U.S. intelligence analysis has been neither very self-conscious about its methods, nor made much use of machines and formal analytic tools. That is Moore's point of departure, and it is a case made graphically by Rob Johnston, on whose work Moore draws. The state of affairs Moore and others describe is changing, and his work should contribute to accelerating that change, in a variety of experiments and pilot projects.

Moore's paper raises at least two intriguing questions at its edges. He rightly takes issue with Malcolm Gladwell's book about the power of unconscious thought or "deliberation without attention."

That said, clever defense lawyers often discredit ballistic experts by asking them to be explicit about how they reached their conclusions. Likewise, chess masters can be reduced to middle-weights by having to explain the logic of their moves. In both cases, the decisions result from patterns as much sensed as seen, the result of thousands of previous cases. I sometimes worried at the NIC that the more we required analysts to be explicit about their methods, the more we risked turning them into middle-weights.

Finding ways to incorporate not just expertise, but also hunch and sense into intelligence analysis is a challenge that lies ahead. The Defense Advanced Research Projects Agency's ill-fated experiment a few years ago seeking to establish a terrorism futures market was testimony to how hard the challenge will be. When the idea became public, every politician – right, left and center – quickly denounced it as borderline immoral. Over the ensuing days, however, a wide range of analysis commented on what a good idea it might have been when information is in short supply and there is a premium on sensing patterns before they become facts.

The second issue is consumers of intelligence, who figure only at the margins of Moore's discussion. We can only hope he is right that better analysis will find, and perhaps help create, a better audience. But the unboundedness of the terrorist threat we now face means that intelligence and policy no longer share a "story" comparable to that about state threats, like the Soviet Union. In principle, that would suggest that policy should accord more time and attention to intelligence, but that is not likely to happen in Washington's whirligig.

Thus, intelligence will need to be as creative in finding new ways to work and communicate with policy officials as it is in improving its analytic techniques. In the process, it will need to rethink what it regards as its *product.* I came to think at the NIC that our product was not really National Intelligence Estimates but, rather, National Intelligence *Officers* – people, not paper, and people in a position to come to know their policy counterparts and to make their expertise available informally, in meetings or at lunch.

Acknowledgments

The first notes for this paper were begun a year prior to the 11 September 2001 terrorist attacks in New York and Virginia as part of research conducted with a peer, Lisa Krizan, on a set of core competencies – knowledge, skills, abilities, and an associated set of personal characteristics – for successful intelligence analysis. At the time, the notion of critical thinking was at best vaguely understood by members of the Intelligence Community, and the National Security Agency (NSA) was no exception. Six years later critical thinking is a recognized key skill by which intelligence readiness is defined at NSA. Similar growth in its importance is recognized elsewhere in the Community. This recognition is due in part to the work of Dr. Linda Elder, Dr. Gerald Nosich and Dr. Richard Paul, all of the Foundation for Critical Thinking. They have created a practical model for critical thinking that is both effective and easy to teach.

That the Paul and Elder model is known within the Intelligence Community is due in no small part to Professor Francis J. Hughes of the National Defense Intelligence College (NDIC). It was he who introduced the author to the model and encouraged attendance at Paul and Elder's annual conference on critical thinking. He kindly also provided a commentary on the paper. Dax Norman, of the NSA Associate Directorate for Education and Training, a number of NSA colleagues, and approximately 250 participants in the NSA critical thinking and structured analysis course helped make that course a reality and additionally provided valuable insights into the nuances of critical thinking. Comments from LT Robert D. Folker, USAF, also provided insight into the teaching of critical thinking. LT Folker developed a similar course while a student at the NDIC that unfortunately did not remain in the curriculum.

As the paper progressed, a number of colleagues and peers provided feedback, comments, and challenges to the arguments presented. They include, in alphabetical order, Solveig Brownfeld, NDIC; James Bruce, SAIC; Jan Goldman, NDIC; Mary Rose Grossman, the John F. Kennedy Presidential Library and Museum; Alexandra Hamlet; Noel Hendrickson, James Madison University;

Robert Heibel, Mercyhurst College; Richards J. Heuer, Jr., Central Intelligence Agency (retired); Norval J. Hilmer, Defense Intelligence Agency; LTCOL James Holden-Rhodes, USMC (retired); Morgan D. Jones, Central Intelligence Agency (retired); Hugo Keesing, Defense Intelligence Agency (retired); Mark Marshall, NDIC; Stephen Marrin, University of Virginia; Montgomery McFate, Institute for Defense Analysis; William Reynolds, Least Squares Software; the staff of the Central Intelligence Agency's Sherman Kent Center; and the staff of the John F. Kennedy Presidential Library and Museum. Several other colleagues at the National Security Agency – who wish to remain anonymous – also offered valuable insight and suggestions.

Three colleagues, Mark Lowenthal, president of the Intelligence & Security Academy, LLC; Jeffrey Cooper, Science Applications International Corporation; and Gregory Treverton, Rand Corporation, also deserve mention. Mark kindly agreed to write the foreword and offered valuable suggestions. His quip about really good analysts set up much of the arguments presented herein. Both Jeff and Greg provided critical comments and suggestions late in the game. They also kindly agreed to write commentaries on the paper.

Russell Swenson, Director of NDIC's Center for Strategic Intelligence Research and NDIC Press editor, did what a really good editor is supposed to do: His input and recommendations ensured that the arguments that follow were focused and strong. The Center's William Spracher also provided valuable technical editing services. Colleague Lisa Krizan provided a final review of the text that proved extremely valuable. This paper would not have been published if not for their dedicated assistance to the author.

Acknowledgment is due to four other people. Peter and Mary Moore encouraged their son to be inquisitive and to always look beyond the obvious for answers. Anthropologist John McDaniel first introduced the author – then a student at Washington and Lee University – to an analogy for intelligence sensemaking: science-based field archaeology. Finally, Elizabeth Moore provided tremendous encouragement. She also graciously tolerated the many nights and weekends spent writing, listening to, and commenting on, ideas as

they occurred, sharpening the resulting arguments. It is to these people that this work is dedicated.

While the author was privileged to receive assistance of others, this remains his work and any errors are his. The author may be reached via electronic mail at dtmoore@nsa.gov.

CRITICAL THINKING AND INTELLIGENCE ANALYSIS

David T. Moore

Examples included in this paper were selected to illustrate points raised by the author. No interest by the National Security Agency, the Department of Defense, or any other agency of the U.S. Government should be inferred from their inclusion.

Abstract

Analysts and analysts alone create intelligence. Although technological marvels assist analysts by cataloguing and presenting data, information and evidence in new ways, they do not do analysis. To be most effective, analysts need an overarching, reflective framework to add structured reasoning to sound, intuitive thinking. "Critical thinking" provides such a framework and goes further, positively influencing the entire intelligence analysis process. Analysts who adopt critical thinking stand to improve their analyses. This paper defines critical thinking in the context of intelligence analysis, explains how it influences the entire intelligence process, explores how it toughens the art of intelligence analysis, suggests how it may be taught, and deduces how analysts can be persuaded to adopt this habit.

Definitions

Thinking – or reasoning – involves objectively connecting present beliefs with evidence in order to believe something else.

Critical Thinking is a deliberate meta-cognitive *(thinking about thinking)* and cognitive *(thinking)* act whereby a person reflects on the quality of the reasoning process simultaneously while reasoning to a conclusion. The thinker has two equally important goals: coming to a solution and improving the way she or he reasons.

Intelligence is a specialized form of knowledge, an activity, and an organization. As knowledge, intelligence informs leaders, uniquely aiding their judgment and decision-making. As an activity, it is the means by which data and information are collected, their relevance to an issue established, interpreted to determine likely outcomes, and disseminated to individuals and organizations who can make use of it, otherwise known as "consumers of intelligence." An intelligence organization directs and manages these activities to create such knowledge as effectively as possible.

CRITICAL THINKING AND INTELLIGENCE ANALYSIS

Introduction: How Do People Reason?

The best analytical tool remains a really good analyst.

—Mark Lowenthal, Former Assistant Director of Central Intelligence for Analysis and Production

To create intelligence requires transformations resulting from an intellectual endeavor that sorts the "significant from [the] insignificant, assessing them severally and jointly, and arriving at a conclusion by the exercise of judgment: part induction, part deduction," and part abduction.[4] That endeavor is known as *thinking*, or "that operation in which present facts suggest other facts (or truths)."[5] Thinking – or as it is sometimes known, reasoning – creates an "objective connection" between our present beliefs and "the ground, warrant, [or] evidence, for believing something else."[6]

These three reasoning processes trace the development of analytic beliefs along different paths. Whereas inductive reasoning reveals "that something is probably true," deductive reasoning demonstrates "that something is necessarily true."[7] However, both are limited:

4 William Millward, "Life in and out of Hut 3," in F. H. Hinsley and Alan Stripp, *Codebreakers: The Inside Story of Bletchley Park* (Oxford, UK: Oxford University Press, 1993), 17. The author adds "abduction" for reasons that will shortly become evident.

5 John Dewey, *How We Think: A Restatement of the Relation of Reflective Thinking to the Educative Process* (New York, NY: D.C. Heath and Company, 1910), 12. Cited hereafter as Dewey, *How We Think*.

6 Dewey, *How We Think*, 12.

7 David A. Schum, "Species of Abductive Reasoning in Fact Investigation in Law," *Cardozo Law Review* 22, nos. 5–6, July 2001, 1645, emphasis added. Cited

inductive reasoning leads to multiple, equally likely solutions and deductive reasoning is subject to deception. Therefore, a third aid to judgment, abductive reasoning, showing "that something is plausibly true," can offset the limitations of the others.[8] While analysts who employ all three guides to sound judgment stand to be the most persuasive, fallacious reasoning or mischaracterization of rules, cases, or results in any of the three can affect reasoning using the others.

Inductive reasoning, moving from the specific to the general, suggests many possible outcomes, or the range of what adversaries may do in the future. However, inductive reasoning lacks a means to distinguish among each outcome – all are possible. An analyst has no way of knowing whether a solution is correct.

Deductive reasoning on the other hand, moving from the general to the specific, addresses questions about adversarial behavior and intentions. Deductive reasoning becomes essential for warning. Based on past perceptions, certain facts indicate specific outcomes. If, for example, troops are deployed to the border, communications are increased, and leadership is in defensive bunkers, then war is imminent. However, if leadership remains in the public eye then these preparations indicate that an exercise is imminent.

Abductive reasoning reveals plausible outcomes to the intelligence analyst. When an adversary's actions defy accurate interpretation through existing paradigms, abductive reasoning generates novel means of explanation. In the case of intelligence warning, an abductive process presents policy–making intelligence consumers with an "assessment of probabilities." Although abduction provides no guarantee that the analyst has chosen the correct hypothesis, the probative force of the accompanying argument indicates that the most likely hypothesis is known and that elusive, actionable intelligence is on tap.

---

hereafter as Schum, "Species." American mathematician, logician, semiotician, and philosopher Charles Sanders Peirce (1839–1914) developed the concept of abductive reasoning. See Joseph Brent, *Charles Sanders Peirce: A Life* (Bloomington, IN: Indiana University Press, 1998).

8 Schum, "Species," 1645.

Figure 1 models analysts' thinking about HUMINT received during the summer of 1962 regarding reports of foreigners in Cuba. An initial (fallacious) conclusion derived from inductive reasoning apparently was reapplied through deductive reasoning as explained in the case study incorporated in this paper.[9] Something else was needed – but not considered – to challenge the initial conclusion that "All HUMINT from Cuba was false."

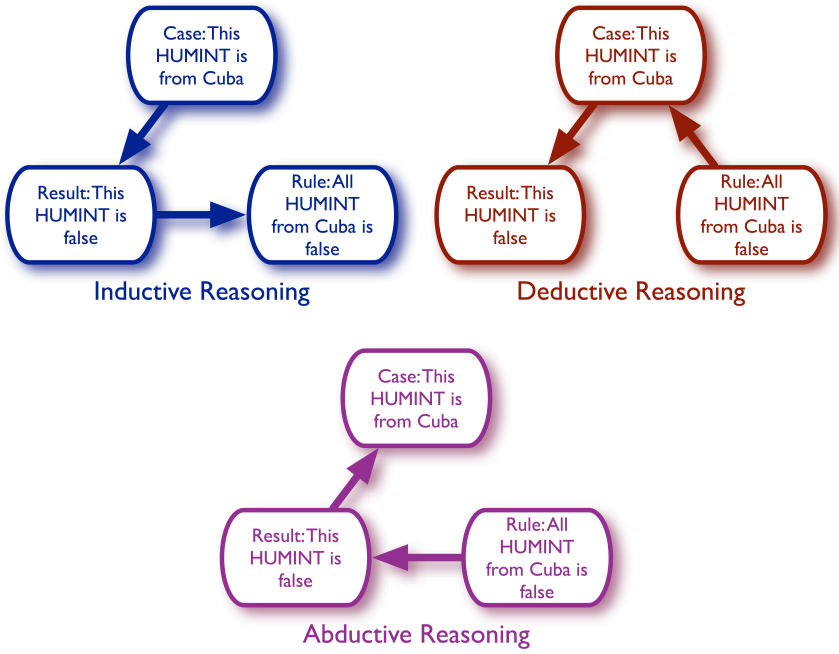

Figure 1: A Comparison of Inductive, Deductive, and Abductive Reasoning

Sources: Adapted from Thomas A. Sebeok, "One, Two, Three Spells UBERTY," in Umberto Eco and Thomas A. Sebeok, *The Sign of Three: Dupin, Holmes, Pierce* (Bloomington, IN: Indiana University Press, 1988), 8; and James H. Hansen, "Soviet Deception in the Cuban Missile Crisis," *Studies in Intelligence*, 46, no. 1 (2002), 56.

If analysts can model an adversary's intentions based on observable actions, adversaries also can deduce how those analysts will have

9 While there is no evidence it was applied in the Cuban case, abductive reasoning is included in the figure for purposes of illustration.

moved toward these conclusions. Under these circumstances, the adversary then can engage in deceptive practices that can lead an intelligence service to misinterpret that adversary's intentions.[10] For example, the Indian government deceived the U.S. Intelligence Community before the former's 1998 nuclear test. Through a 1995 demarche from the U.S. government, the Indian government knew what indicators the U.S. sought and was able to obscure them until after the test. Then, the Indian government boasted of its success.[11]

Abduction forces a close consideration of the evidence at hand. Given competing estimates – such as "war is imminent" or "an exercise will occur" – the body of facts and inferences must be examined to determine "whether there are facts which falsify one of the estimates."[12] Only then can an assessment of accuracy be determined. Even then, the selected estimate remains only the "most likely."[13]

Despite their individual limitations, induction, deduction, and abduction taken together offer a means of thoroughly examining evidence in order to arrive at accurate intelligence conclusions. However, as becomes obvious from studying figure 1, in order to be successful, intelligence analysis requires something more: an overarching framework is needed to ensure reasoning relies on valid assertions, is not fallacious, and is self–consciously objective. Critical thinking provides that framework by ensuring that each form of reasoning is appropriately used. Critical thinking extends to the entire intelligence analysis process. The claim here is that analysts who

become better critical thinkers will improve their analyses, helping to lessen the likelihood of intelligence failures. In the example above, critically thinking analysts would have questioned the generalizing of their initial conclusion by asking, "Was all the HUMINT from Cuba *really* false?" To avoid the tautological problem of equating quality analysis with the concept of "critical thinking" requires a careful assessment of cognition in the intelligence environment. The underlying question is "How can the intelligence analysts to whom Lowenthal's epigraph refers be 'really good'?"

Defining Critical Thinking

Defining critical thinking is a first step to understanding how it contributes to intelligence analysis. Richard Paul and Linda Elder, of the Foundation for Critical Thinking, consider it to be

> that mode of thinking – about any subject, content, or problem – in which the [solitary] thinker improves the quality of his or her thinking by skillfully taking charge of the structures inherent in thinking and imposing intellectual standards upon them.[14]

In other words, critical thinking is both a deliberate meta-cognitive *(thinking about thinking)* and cognitive *(thinking)* act whereby a person reflects on the *quality* of the reasoning process simultaneously while reasoning to a conclusion. The thinker has two equally important goals: improving the way she or he reasons and coming to a correct solution.[15]

To accomplish these goals, the reasoner requires assisting structures. Paul and Elder define eight elements of reasoning, shown in figure 2. These elements lead thinkers to ask focused questions about the topic being considered and the thinking process itself. Paul and Elder assert that whenever people reason, they do so for a purpose. This reasoning exists within a point of view and is shaped by both conscious and unconscious assumptions. Reasoning involves the creation of inferences based on conceptual frameworks about reality. These inferences are generated as people consider evidence necessary to answer questions or solve problems. Further, reasoning leads to decision points with implications – things that might happen

14 Richard Paul and Linda Elder, *The Miniature Guide to Critical Thinking Concepts and Tools*, 4th Edition (Dillon Beach, CA: The Foundation for Critical Thinking, 2004), 1. Cited hereafter as Paul and Elder, *Concepts and Tools*.

15 Exactly what is the "correct solution" is issue and context dependent. What is important here is that the process of reasoning is enhanced.

– *and* consequences – things that do happen once the decision has been made. Finally, Paul and Elder insist that "learning to analyze thinking requires practice in identifying the structures in use."[16]

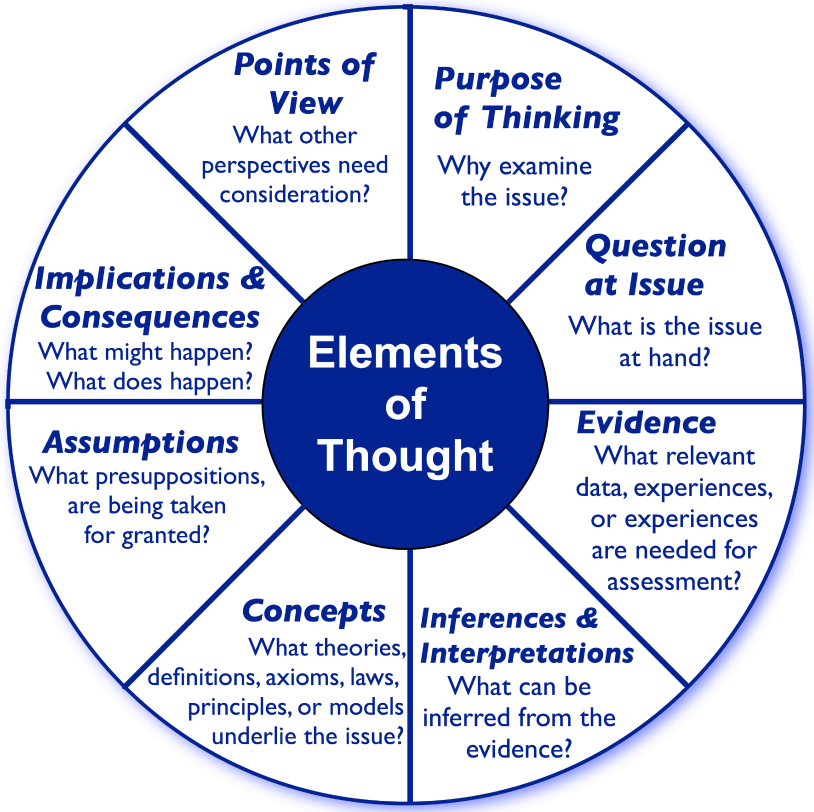

Figure 2: Elements of Thought

Standards for Critical Thinking

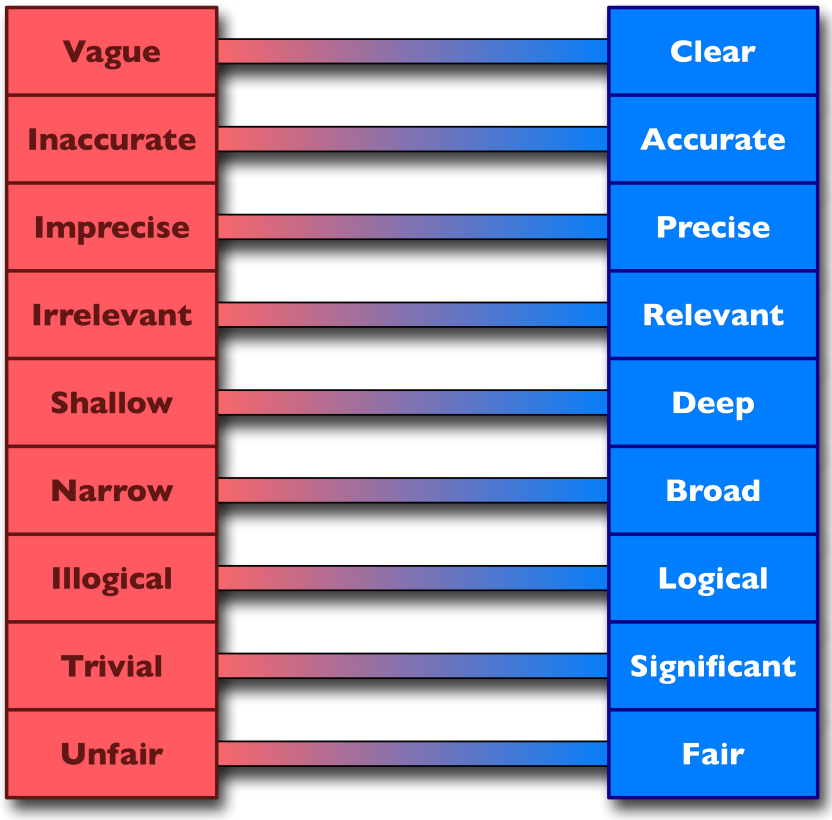

Figure 3: A Continuum of Intellectual Standards

Source: Derived from Paul and Elder, *Concepts and Tools*, 9.

Paul and Elder also establish a set of intellectual standards that offer criteria for assessing the level and quality of thinking. These form a continuum as shown in figure 3.[17] Active – or Socratic – questioning in a social setting becomes the means of critically exploring a topic or discipline as well as assessing the thinking on that topic. Questions assessing the issue delve into purpose, assumptions, inferences, as well as points of view on a topic.[18] Paul and Elder's

17 Elder and Paul, *Analytic Thinking*, 1–17.

18 Paul and Elder, *Concepts and Tools*, 2–9.

approach ensures that a topic or issue is thoroughly, logically, and objectively developed. Their continuum provides qualitative metrics to inform the thinker and others who may evaluate the object of the thinking along with the process employed. Each standard is related to but independent of the others. The object of consideration might be vaguely or clearly presented. But it also might be inaccurate. An example of this would be "the world is flat." This clear statement of reality is false.

The reasoning or its object might be clearly and accurately presented but remain imprecise, the level of detail required depending on the issue itself. Precision becomes important in assessing the location of an adversary or a threat as in "terrorists placed the improvised explosive device (IED) near the highway."

It is possible to create clear, accurate, and precise answers that are irrelevant. If one is considering the IED along the highway but the issue is how best to fly the troops in question from one location to another then the answer is irrelevant. Similarly, topics and their accompanying reasoning need to consider both the complexities involved (depth) and other points of view (breadth).[19] Such reasoning becomes essential when systems must be assessed because in systems "chains of consequences extend over time and many areas: The effects of action are always multiple."[20] Intelligence often must assess such systems – terrorist networks are but one example. Additionally, as sociologist Emile Durkheim observes, the combinations of elements related to an issue "combine and thereby produce, by the fact of their combination, new phenomena."[21]

When the correct phenomena or questions – and related alternative explanations – are not fully considered, intelligence failures occur. For instance, the Senate Select Committee on Intelligence

19 Elder and Paul, *Analytic Thinking,* 7.

20 Robert Jervis, *System Effects: Complexity in Political and Social Life* (Princeton, NJ: Princeton University Press, 1997), 10. Cited hereafter as Jervis, System Effects.

21 Emile Durkheim, *The Rules of Sociological Method* (Glencoe, IL: Free Press, 1938), xlvii.

found such reasoning to be among the causes of the Intelligence Community's failure to assess accurately Iraq's alleged programs to develop weapons of mass destruction (WMD). The senators noted that "Intelligence Community managers…did not encourage analysts to challenge their assumptions, fully consider alternative arguments, accurately characterize the intelligence reporting, or counsel analysts who lost their objectivity."[22]

Logic and significance also come into play. If the evidence presented does not imply the conclusions then the results are illogical. Focusing on appropriate evidence maintains significance. For example, evidence that terrorists who place an IED also have Stinger surface–to–air missiles bears on how troops can move across hostile territory.

Fairness deals with the agendas – hidden and expressed – of the thinker, her collaborative peers, and her customers. Knowing who has a stake in an issue as well as the stakes themselves helps ensure that issues are fairly reasoned and presented. Such considerations also reflect the analyst's own biases or opinions. In considering this point, Paul and Elder offer the evaluative question, "Am I misrepresenting a view with which I disagree?"[23]

Finally, while getting to the right-hand side of the spectrum on each of these standards in figure 3 is highly desirable, the standard of thinking on an issue will vary based on the skills of the thinkers and the issues under scrutiny. Assessing the resulting shortfalls in thinking reveals gaps that can be corrected. The continuum therefore provides a detailed assessment by which thinking on issues can be improved.

Skill-Based Definitions

Other approaches to defining critical thinking focus on the specific skills. For example, Diane Halpern considers that

> [critical] thinking is the use of those cognitive skills or strategies that increase the probability of a desirable outcome. It is… thinking that is purposeful, reasoned, and goal directed – the kind of thinking involved in solving problems, formulating inferences, calculating likelihoods, and making decisions, when the thinker is using skills that are thoughtful and effective to the particular context and type of thinking task.[24]

Additional advocates of skills-based critical thinking include Edward Glaser and Alec Fisher, and their sets of critical thinking skills include a number of elements common to those identified by Halpern. The overlapping competencies of critical thinkers as advanced by Paul and Elder and these three other proponents are summarized in table 1. The comparison reveals the completeness of the Paul and Elder model.

These competencies assist intelligence analysts who contribute to the solution of threats to national security by ensuring the formulation of sound inferences about adversarial capabilities and intentions. Resulting findings are disseminated in reports that are often referred to as "assessments." At their best, they offer choices to decision-making consumers, as well as a clear outline of the implications of those choices.[25]

---

24 Diane Halpern, *Thought and Knowledge: An Introduction to Critical Thinking*, 4th Edition (Mahwah, NJ: Lawrence Erlbaum Associates, Publishers, 2002), 37. Cited hereafter as Halpern, *Thought and Knowledge.*

25 The term "assessment" describes the result of an intelligence production process but is not universally used within the Intelligence Community. Assessments are created at the Central Intelligence Agency and at the Defense Intelligence Agency. Other names for the reports that analysts produce include "products" at the National Security Agency (NSA) and "estimates" at the National Intelligence Council (NIC). Regardless of how they are named, they record and disseminate the results of analysts' work.

Competencies of Critical Thinkers	Paul and Elder	Fisher	Glaser	Halpern
Recognize problems or questions and find effective means of solution	✓		✓	✓
Engage in meta-cognitive activities that identify assumptions, biases, and performance as solutions are developed	✓	✓	✓	✓
Interpret data, appraise evidence, and evaluate statements in order to recognize logical relationships between propositions	✓		✓	✓
Infer warranted conclusions and generalizations from evidence	✓	✓	✓	✓
Test generalizations and conclusions by seeking out contradictory evidence that enables them to judge the credibility of claims	✓	✓	✓	✓
Convey sound, well-reasoned arguments	✓	✓	✓	✓
Focus on the process of reasoning with the intention of improving the process	✓			

Table 1: A Comparison of Different Sets of Critical Thinker's Competencies

A Disposition to Think Critically

It is not enough merely to know the skills needed for critical thinking. To be successful, analysts as critical thinkers also need "certain attitudes, dispositions, passions, [and] traits of mind."[26] Actively thinking critically hones the skills; practice yields proficiency. But in order to gain mastery, willingness to reason in this manner becomes essential. The importance of this disposition to critically think cannot be over-emphasized. According to Peter A. Facione, Noreen C. Facione, and Carol A. Giancarlo, "Empirical studies…at multiple sites indicate that for all practical purposes" both critical thinking skills and the disposition to critically think are essential.[27]

There are a number of characteristics associated with the disposition to think critically. The Faciones and Giancarlo identify "seven characterological attributes or habits of mind… truth-seeking, open-mindedness, analyticity, systematicity, critical thinking, self confidence, inquisitiveness, and maturity of judgment."[28] According to Richard Paul and Gerald Nosich, the characteristics of critical thinkers include

> thinking independently, exercising fair-mindedness, developing insight into egocentricity and sociocentricity, developing intellectual humility and suspending judgment, developing intellectual courage, developing intellectual good faith and integrity, developing intellectual perseverance,

developing confidence in reason, exploring thoughts underlying feelings and feelings underlying thoughts, developing intellectual curiosity.[29]

Both sets closely match the characteristics of successful intelligence analysts identified by Lisa Krizan and the author in their work on intelligence analysts' core competencies. Krizan and the author observe that successful intelligence analysts are insatiably curious. Fascinated by puzzles, their high levels of self-motivation lead them to observe and read voraciously, and to take fair-minded and varied perspectives. This helps them to make the creative connections necessary for solving the hardest intelligence problems. Finally, the emotional tensions created by problems, and the cathartic release at their solution, powerfully motivate analysts.[30]

In addition, emotions play a significant part in the process of critical thinking. As adult learning expert Stephen Brookfield observes, "[emotive] aspects – feelings, emotional responses, intuitions, sensing – are central to critical thinking."[31] He argues that the consideration of alternatives "to one's current ways of thinking" characterizes the approach.[32] Indeed, the consideration of these alternatives requires creativity, which he considers a non–rational form of thought.[33] Creative reasoning generates hypotheses; it has contributed significantly to the development of intellectual, scientific, and technological knowledge.

The Role of Questions

Greg Treverton observes that in intelligence the right questions rarely get asked.[34] Yet, critical thinking offers a means by which at least *appropriate* questions may be raised. The combination of critical thinking skills and the disposition to think critically focuses and directs inductive, deductive, and abductive reasoning to solve problems. This is an interrogative paradigm. Critical thinking involves questioning that forces broader consideration of issues and problems as well as the various means of resolving or answering them. Such questioning happens at both the individual and collective levels as shown in figure 4.

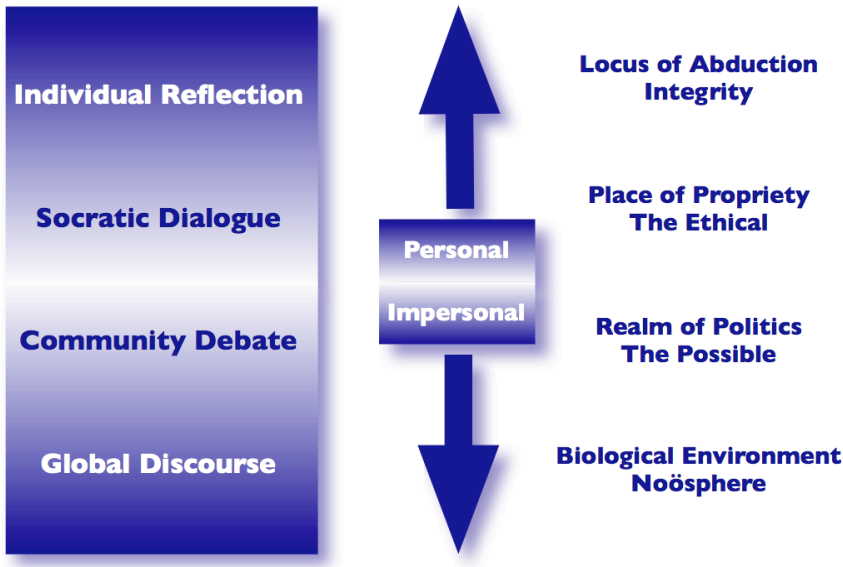

Figure 4: Levels of Questioning: Critical Thinking in a Social Setting

Source: Created by the author with contributions by Russell G. Swenson.

Questioning is either personal or impersonal and ranges from the musings of the individual critical thinker to that of a global discourse. As an individual ponders problems and issues, she abduces the most likely explanations. Moving up a level, questioning becomes a

34 Greg Treverton, conversation with the author, 18 April 2006.

hierarchical dialogue within dyads or larger assemblies. A critically thinking questioner ferrets out answers from others within the group. The process generates new questions that are answered in turn – and in turn, raise further questions. At the level of a community debate, critical thinkers explore what is possible politically and within the community's purview. Ideally, the relationship between thinkers is peer-to-peer. Finally, questions addressed within the context of a global discourse take into account the entire biological landscape (noösphere).[35]

Such questioning produces new and creative thinking, analogous to switching from Newtonian to quantum physics. In this analogy, an atomistic approach to analysis gives way to the associative impulse of synthesis as structured thoughts facilitate a leap to new questions, ideas, and possibilities. This overarching framework of structured reasoning frames questions to help analysts decide the best means or best combination of means that are suited to solving specific intelligence problems. The questions serve to alert an analyst to the notion that she might be deceived, or that she needs to employ some other means of reasoning to determine which of several alternative outcomes is most likely. These questions provide a formal means by which an analyst confronts her biases about likely outcomes. Therefore, in the context of intelligence analysis, critical thinking becomes one of the most – if not *the* most – important skills of the analyst. Facing symmetric and asymmetric threats, analysts have a potent and powerful tool to facilitate their asking the right questions in the process of improving their understanding of the problem at hand as well as their own reasoning about that problem.

Pseudo-Critical Thinking

It is important to understand what critical thinking is *not*. Critical thinking, as has been noted, focuses on both the process and the results of reasoning. However, the term is also used in reference to reasoning that is not reflective. The application of formal logic is sometimes (incorrectly) equated to critical thinking. So too are

35 Wikipedia defines the noösphere as the domain of human thought. Wikipedia, entry under "noösphere," accessed 27 February 2006.

problem solving and structured methods of analysis. Developers of school curricula and other exponents of "sound thinking" often lay claim to the mantel of critical thinking but are really leveraging their coverage of logic or problem solving to capitalize on an uncritical understanding of what critical thinking is. Problem solving, for example, focuses on answers and not on the process by which an answer is obtained. Additionally, logic or problem solving, being goal oriented, offer little means by which a person can improve the process of her thinking. The following problem is a typical example of pseudo–critical thinking:

> Two cyclists race along a straight course. The faster of the pair maintains an average speed of 30 mph. The slower cyclist averages 25 miles per hour. When the race ends, the judges announce that the faster cyclist crossed the finish line one hour before the slower racer. How many miles long was the racing course?[36]

This example (and others like it) focuses on the answer, provides no guidance on the process, and ignores any improvement in reasoning skills. Solvers either figure it out through trial and error or by following a rule-based strategy learned by rote. Therefore it fails to be critical thinking.

Unless the process, and the means, to improve a person's reasoning are emphasized, then at best such examples teach structured problem solving. At worst, they deal merely in criticism; they fail to assist people to learn to reason better. Central to critical thinking are the twin foci on the way in which a person is reasoning and the goal of improving that process. One could easily infer that misconceptions about critical thinking could be associated with what is taught as critical thinking in American educational institutions.[37]

What Can Be Learned from the Past? Thinking Critically about Cuba

Examining past intelligence successes and failures in light of new developments provides a means to reassess what happened and how outcomes could have been different. The case of the Soviet missiles in Cuba in the summer and fall of 1962 provides a means of examining how critical thinking and structured methodologies could have made a difference.

Deploying the Missiles

During the summer of 1962, CIA analysts received a spate of potentially alarming reports about Russians being seen in Cuba. The reports, however, were only part of a stream of similar, "farfetched tales of African troops with rings in their noses, lurking Mongolians, and even Chinese troops" on the island.[38] Most or all of these reports were discounted by analysts who were inured to spurious reports of Soviet equipment secreted away in caves.[39]

James Hansen – who worked in both the Central Intelligence Agency (CIA) and Defense Intelligence Agency (DIA) – posits that the U.S. Intelligence and Policy Communities were the victims of a concerted Soviet campaign of denial and deception that masked the deployment of Soviet forces and missiles into Cuba.[40] The deception campaign even included "accurate information about the deployment [leaked] so as to mask it."[41] As Raymond Garthoff relates, "there were literally thousands of reports of missiles in Cuba in the period *before* any missiles were actually brought there."[42]

42 Raymond L. Garthoff, "US Intelligence in the Cuban Missile Crisis," in

In fact, the Soviets were able to deploy more than the offensive nuclear missiles that became the centerpiece of the subsequent crisis with the United States. While U.S. analysts and policymakers knew of the conventional weapons, they were blind to the presence of SS-4 Medium Range Ballistic Missiles (MRBM) and SS-5 Intermediate Range Ballistic Missiles prior to the U-2 overflights of 14 October. Additionally, it seems they never discovered the presence of approximately 100 tactical nuclear weapons deployed on the island.[43] There is debate whether U.S. Intelligence also *underestimated* the number of Soviet troops deployed to Cuba. Garthoff reports that one CIA unit concluded there were between 45,000 and 50,000 Soviet troops in Cuba (the actual number was about 42,000) but the official estimate was between 4,500 and 5,000 prior to the crisis.[44]

The Soviets employed an elaborate campaign of denial and deception that took advantage of American points of view about the likelihood of Soviet weapons being located in Cuba. As Robert Jervis makes clear,

> the U.S. did not expect the Russians to put missiles into Cuba or Japan to attack Pearl Harbor because American officials knew that the U.S. would thwart these measures if they were taken. These judgments were correct, but because other countries saw the world and the U.S. less accurately, the American predictions were inaccurate.[45]

It could have been worse. As Gil Merom writes, the Soviets might

have *completed* the bases and "threatened major U.S. cities with extinction."[46] The threat is brought home by figure 5.

What caused U.S. analysts to get it wrong? Apparently the U.S. analysts concluded that because some of the HUMINT evidence was ludicrous, all of it was. This inductive conclusion then led them to discount further evidence. For example, having concluded that all the previously considered Cuban HUMINT was false, each new piece, *since it came from Cuba,* also had to be false. Thus, a false inductive conclusion led subsequently to false deductive conclusions.[47] It does not appear that abductive reasoning strategies were ever employed.

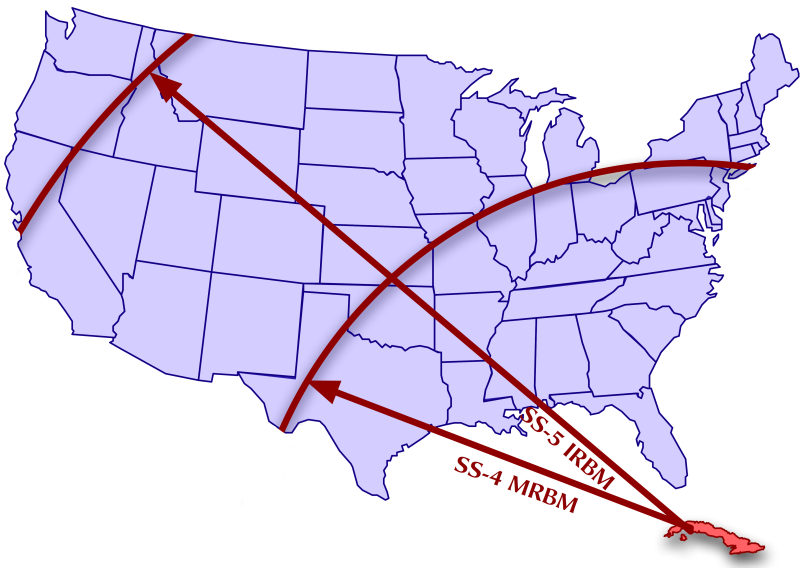

Figure 5: Respective Ranges of Soviet SS-4 MRBM and SS-5 IRBM Missiles

Source: Derived from Hansen, "Soviet Deception," 49.

46 Gil Merom, "The 1962 Cuban Intelligence Estimate: A Methodological Perspective," *Intelligence and National Security* 14, no. 3 (Autumn 1999), 49. Cited hereafter as Merom, "Estimate."

47 Inductive and deductive reasoning were illustrated in figure 1.

It should be noted that the U.S. Intelligence Community was not blind to the possibility that the Soviets might conduct a military buildup in Cuba. In fact, there were two theories being debated: One, that the Soviets would emplace *defensive* weapons, and the other that they would emplace *offensive* weapons. Senior analysts in the Intelligence Community held the former theory while John McCone, then Director of Central Intelligence, favored the latter.

Part of McCone's reasoning had to do with the cost and utility of the installation of SA-2 air defense missiles. McCone apparently reasoned that the purpose of installing such expensive missiles had to be greater than merely denying the United States overflight capabilities (the SA-2 could shoot down – as Francis Gary Powers discovered – a U-2).[48] This led McCone to come "up with an answer that no one wanted to hear: the SA-2s were on the island to deny the United States the capability to see the construction of offensive missile installations."[49]

Unfortunately, McCone was unable to dissuade the majority from their point of view. This may have stemmed, as James Blight and David Welch write, from the realization that while McCone's inference seemed reasonable when viewed in hindsight, in foresight it was faulty because it failed to sufficiently cover the alternatives.[50] Blight and Welch observe that

> the Soviets had also deployed SA-2 missiles to Egypt, Syria, and Indonesia, and in none of those cases had they also deployed strategic nuclear weapons. Indeed, the US intelligence community [sic] expected that the Soviet Union

48 Thomas R. Johnson and David A. Hatch, *NSA and the Cuban Missile Crisis* (Fort Meade, MD: National Security Agency Center for Cryptologic History, 1998), URL: <http://www.nsa.gov/publications/publi00033.cfm>, last accessed 18 April 2006. Cited hereafter as Johnson and Hatch, *NSA*.

50 James G. Blight and David A. Welch, Eds., *Intelligence and the Cuban Missile Crisis* (London, UK: Frank Cass, 1998), 5. Cited hereafter as Blight and Welch, Intelligence and the Cuban Missile Crisis.

would deploy SA-2 missiles to Cuba, precisely because it had done so elsewhere.[51]

Even though history proved McCone to be correct (for the wrong reasons), the defensive weapons theory predominated.[52]

The Soviets took advantage of the American beliefs and faulty reasoning. Capitalizing on the idea that it is easier to lead a target astray than to try to change his mind, they successfully placed the nuclear missiles in Cuba.[53] Heuer observes that

> [deceptions] that follow this principle seldom fail, for the odds are then strongly in favor of the deceiver. The human capacity to rationalize contradictory evidence is easily sufficient to outweigh the pernicious effects of security leaks and uncontrolled channels of information that planners of deception…might compromise their efforts.[54]

Assessing the Implications

Exactly what happened in the Cuban case and does it apply to contemporary issues? Roberta Wohlstetter notes in retrospect, "We would like to know not only how we felt, but what we did and what we might have done, and in particular what we knew or what we could have known."[55] Wohlstetter's musings lead to two key questions for analysts: How could this successful deception campaign have been

51 Blight and Welch, *Intelligence and the Cuban Missile Crisis*, 5.

52 Merom, "Estimate," 58.

53 Richards J. Heuer, Jr., "Strategic Deception and Counterdeception: A Cognitive Process Approach," *International Studies Quarterly* 25, no. 2 (June 1981), 200. Cited hereafter as Heuer, "Strategic Deception." It is interesting to speculate whether the Soviets had a feedback channel that informed them of the predominant theory.

54 Heuer, "Strategic Deception," 200.

thwarted? What can be learned to advise analysts about current adversarial denial and deception?

Simply looking at additional evidence is sometimes promoted as a means of detecting denial and deception by adversaries. In the Cuban case, however, analysts had already processed a superabundance of evidence. Wohlstetter suggests that such riches can be "embarrassing."[56] This is because even as "signals" point

> to the action or to an adversary's intention to undertake it, "noise" or a background of irrelevant or inconsistent signals, [and] signs pointing in the wrong directions…tend always to obscure the signs pointing the right way.[57]

HUMINT assets overwhelmed analysts' abilities to distinguish signals from noise. Heuer and Hansen agree that once "locked in," analysts resist changing their minds. More evidence alone fails to change an analyst's mind because "[new] information is assimilated to existing images."[58] Yet, analysts stand to benefit from changing their opinion in the face of disconfirming evidence.

The limitations of hindsight analysis notwithstanding, if analysts had employed critical reasoning in 1962 they could have detected the Soviet *maskirovka* in Cuba. For example, by applying Paul and Elder's model of critical thinking, analysts would have had a means to question their assumptions and points of view, and subsequently might have questioned the purpose of the apparent "noise" they were discounting as well as their assumptions about the prevalent point of view that the Soviets would not place missiles on the island because we would react. Gil Merom suggests that some appropriate questions would have included: "How aware were the analysts of their own assumptions? Were these assumptions sensible and was it sensible to adhere to them?"[59] Other considerations that critical

59 Merom, "Estimate," 57.

thinking about the crisis might have raised are included in table 2. Applying Paul and Elder's model reveals other considerations that conceivably would have led to an earlier detection of the likelihood of the deployed weapons being *offensive.*

Would this approach have allowed detection of what the Soviets were doing in Cuba before mid-October 1962? One could argue counterfactually that it might have enhanced analysis of collection from other sources.[60] SIGINT assets capable of collecting Russian communications were in place near the island.[61] Imagery assets might have been tasked differently prior to 14 October. Sources less subject to generating noise would have introduced inconsistencies to an analysis of competing hypotheses that was solely HUMINT-based.

Between Dogmatism and Refutation

A systematic approach to directed collection also would have moved analysts toward a disconfirmatory analytic approach. By contrast, a confirmatory approach, often characterized as confirmation bias, leads analysts to accept what they set out to confirm.[62] A disconfirmatory approach aims to refute alternative

---

60 Counterfactual reasoning explores differing outcomes arising from alternative causes. Counterfactuals are commonly used in whenever alternate hypotheses are explored. They are essential for both post-mortem reviews and futures scenario exercises. See Philip E. Tetlock, and Aaron Belkin, *Counterfactual Thought Experiments in World Politics: Logical, Methodological, and Psychological Perspectives* (Princeton, NJ: Princeton University Press, 1996), 1–38. In the same volume, Richard Ned Lebow and Janice Gross Stein conduct a counterfactual review of the Cuban missile crisis. See Richard Ned Lebow, and Janice Gross Stein, "Back to the Past: Counterfactuals and the Cuban Missile Crisis," in Philip E. Tetlock, and Aaron Belkin, *Counterfactual Thought Experiments in World Politics: Logical, Methodological, and Psychological Perspectives* (Princeton, NJ: Princeton University Press, 1996), 119–148.

61 Johnson and Hatch, *NSA*. According to the authors, SIGINT played a key role in determining the operational status of the SA-2 air defense missiles. However, SIGINT failed to detect the delivery and installation of the nuclear missiles.

62 Wikipedia defines confirmation bias as "a type of cognitive bias toward confirmation of the hypothesis under study." (Wikipedia, entry under "confirmation bias").

Purpose	· Determine what is going on in Cuba as a part of the U.S. "war" against Castro and the Cuban communists.
Key Questions	· If this really is a Soviet military buildup, what kinds of weapons are being deployed: offensive weapons or defensive weapons? · Why is an expensive missile system like the SA–2 being installed in Cuba? · What is the SA–2 really protecting? · Does a crisis exist?
Evidentiary Considerations	· If defensive weapons are being deployed, what evidence should be observed? · If offensive weapons are being deployed, what evidence should be observed? · What is not being seen?
Inferences	· What is inferred from the observed and collected evidence?
Assumptions	· What is being assumed about the evidence? · What is being assumed about the sources of the evidence? · What is being assumed about why the Soviets would deploy weapons to Cuba?
Concepts	· How does human perception affect the analysis? · How reliable are the sources of evidence? (Could also be an assumption.)
Implications and Consequences	· If conclusions are incorrect about the Soviet build up, what might occur next? · If conclusions are correct about the Soviet build up, what can be expected? · If conclusions are incorrect about offensive weapons being deployed, what happens next? · If conclusions are incorrect about defensive weapons being deployed, what happens next?
Points of View	· What other points of view about what is going on in Cuba exist?

Table 2: Applying Paul and Elder's Critical Thinking Model to the Situation in Cuba, August–September 1962.

Source: Developed by author.

hypotheses. Whatever was left at the end of the process would be the most likely explanation. Would this guarantee a correct "answer"? Ben-Israel concludes that although the answer has to be "no," the approach does allow for narrowing "the margin of error."[63] It does so by moving the analyst away from a "pole of dogmatic tenacity" toward a "pole of refutation" (summarized in figure 6).[64]

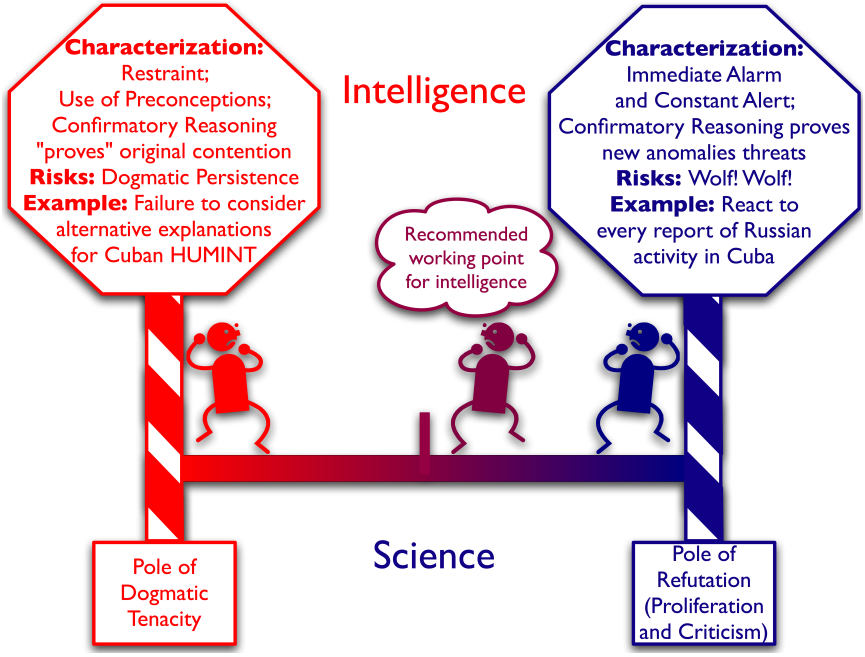

Figure 6: A Place for Analysis between Dogmatism and Criticism

Source: Derived from Ben-Israel, "Methodology of Intelligence," 679.

It should be noted that operating too closely to a pole of refutation can also create problems. For example, analysts might be unable to distinguish between real threats and false positives; they might react to each one regardless of its validity. In the Cuban case, this problem would have manifested itself in goading continual U.S. military reactions to every perceived Soviet and Cuban threat. Here again,

63 Ben-Israel, "Logic of the Estimate Process," 679

64 Ben-Israel, "Logic of the Estimate Process," 691.

critical thinking could moderate this Cassandrian approach.[65] The questioning of assumptions and points of view in critical thinking allows analysts to *discount* certain evidence. Based on his own Israeli intelligence analyst experiences, Ben-Israel asserts that anchoring oneself some distance from a pole of refutation, and not far from the center, is probably best.[66] In other words, enlightened skepticism probably works as a method for distinguishing between real and perceived threats. Critical thinking leads one to assess the processes one is using and the point on the continuum from which to work.

Lacking: Disconfirmation

Merom confirms that a disconfirmatory process did not occur on the Cuban missile problem: "Information that was inconsistent with the prevailing conservative theory was not considered as alarming and necessitating revision, but rather was 'rehabilitated' and rendered 'harmless' on the basis of *ad hoc* statements."[67] Instead, inductive reasoning generally led analysts to "prove" their theory and subsequently to adhere to it "*until it was proven wrong* by conclusive hard evidence" – the U–2 photos, to be exact (of which a detail is reproduced in figure 7).[68]

---

65 Cassandra was the daughter of Priam, King of Troy. She was blessed and cursed by the god Apollo to accurately predict the future yet never be believed. In intelligence, a Cassandrian approach is characterized as one that emphasizes dire outcomes and worst–case scenarios. Analysts who produce such assessments are often discounted and rarely thanked when they are correct. For a real account of how such warnings are perceived (at least at the time they are made), see Charles E. Allen, "Intelligence: Cult, Craft, or Business?" in *Seminar on Intelligence, Command, and Control, Guest Presentations,* Spring 2000 (Cambridge, MA: Harvard University Program on Information Resources Policy, I–01–1, April 2000), URL: <http://www.pirp.harvard.edu/pubs.html>, last accessed 11 January 2006.

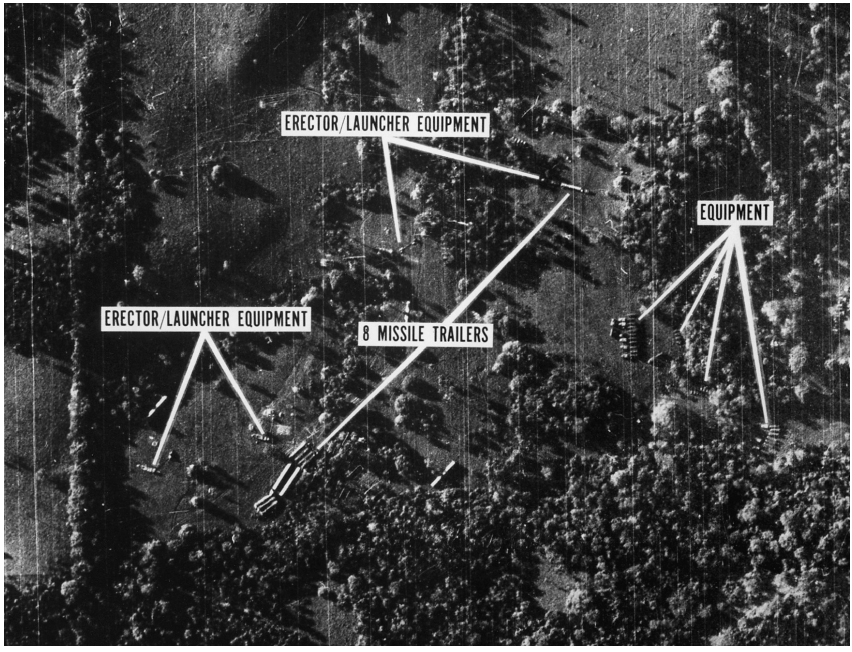

Figure 7: Detail of a U-2 Photograph of an SS-4 MRBM Launch Site, San Cristobal, Cuba, 14 October 1962. This evidence confirmed that Soviet missiles were being installed in Cuba.

Source: U.S. Department of Defense, photograph in the John Fitzgerald Kennedy Library, Boston, MA, PX 66–20:7 14 October 1962.

What tipped off the overhead surveillance were two HUMINT reports of "a Soviet truck convoy that appeared to be towing ballistic missiles toward the San Cristobal area."[69] That these reports were taken seriously is one of the curious serendipities that occur from time to time in intelligence analysis (and other research-based domains). What prompted the CIA and DIA analysts to take these reports seriously while earlier accounts had been dismissed remains a mystery. Garthoff asserts that it was new information taken in context with the observed "pattern of SA-2 surface-to-air missile sites in Western

69 Graham Allison and Philip Zelikow, *Essence of Decision: Explaining the Cuban Missile Crisis,* 2nd Edition (New York, NY: Longman, 1999), 220. Cited hereafter as Allison and Zelikow, *Essence of Decision.* Raymond Garthoff also notes this to be the case. See Garthoff, "US Intelligence," 23.

Cuba" that led to the tasking of the U-2 flight on 14 October (the track of which is shown in figure 8).[70]

Also contributing to the determination that the deployed missiles were SS-4 MRBMs was information transmitted to the British and American intelligence services by Oleg Penkovsky. While Penkovsky's espionage apparently did not warn the Americans that the Soviets were about to deploy offensive missiles in Cuba, he is credited with – among other things – providing technical information about the missiles.[71] Len Scott observes that Penkovsky provided the technical information that allowed the determination that the missiles were SS-4s instead of SS-3s, as well as information that allowed accurate assessment by the Americans of their readiness. Scott writes that this was important because

> the SS-3 had a range which US intelligence estimated at 630 nautical miles (nm), enabling coverage of seven Strategic Air Command (SAC) bomber/tanker bases; the 1020nm SS-4 could target 18 bomber/tanker bases (plus one ICBM complex), and some 58 cities with a population of over 100,000, including Washington, accounting for 92 million people.[72]

Shortly thereafter Penkovsky was detected, arrested, tried, and executed by the Soviets for his espionage.

72 Scott, "Penkovsky," 34. In making this assertion Scott draws on work previously published by Allison and Zelikow in *Essence of Decision* and by Mary S. McAuliffe, ed., *CIA Documents on the Cuban Missile Crisis, 1962* (Washington DC: Central Intelligence Agency, 1992).

Figure 8: U–2 Tracks over Cuba, 4–14 October 1962.

Sources: Map, Central Intelligence Agency. Tracks derived from a map in Mary S. McAuliffe, ed., *CIA Documents on the Cuban Missile Crisis, 1962* (Washington DC: Central Intelligence Agency, 1992), 3. Hereafter McAuliffe. Missile locations derived from Arthur C. Lundahl, "Additional Information – Mission 3102," Memorandum for Director of Central Intelligence and Director, Defense Intelligence Agency, 15 October 1962, in McAuliffe, 181–182; and Arthur C. Lundahl, "Additional Information – Mission 3107," Memorandum for Director of Central Intelligence and Director, Defense Intelligence Agency, 19 October 1962, in McAuliffe, 209. Track and missile locations are approximations. Lundahl was the Director, National Photographic Interpretation Center. The 19 October memo reports that a 5 September U–2 overflight did not detect the latter two missile sites. However, a review of the 5 September track (as presented in McAuliffe) shows the aircraft only came near the Sagua La Grande site. It should also be noted that the track of the U-2 – as flown on 14 October – deviated from the original planned route (which was farther to the west). The track as flown took the aircraft closer to the San Cristobal site. What might have happened had the original track been flown?

Despite their efforts at denial and deception, there was an evident lack of concealment of the missiles by the Soviets prior to their "discovery" on 14 October. General Anatoli Gribkov, a member of the Soviet General Staff in Cuba at the time relates,

> A missile–launching complex is not easily disguised…[Such] an installation…could be hidden from ground-level view. But from above, however, it could and did stick out like a sore thumb.[73]

Allison and Zelikow note that the Soviets only began to camouflage the sites *after* "the U.S. announced the discovery of the missiles and announced the blockade."[74] They conclude that the Soviet forces building the bases lacked personnel and resources to conceal them – a situation that apparently changed only after the missiles had been discovered.[75]

The Roles of Critical Thinking in the Cuban Crisis

Merom's critique of the Intelligence Community's estimate of Soviet intentions vis-à-vis Soviet weapons in Cuba reveals areas that would be well-served by critical thinking. First, when a critical thinking paradigm is in control, intelligence foraging and gathering are efficiently oriented. Questions are raised about the existing evidence – both anomalous and consistent – as well as where new disconfirming and confirming evidence might be discovered. Second, alternative – what in the context of Cuba, Merom calls *revolutionary* – theories are considered.[76] A structured process also speeds up the process of analytic sensemaking: estimates are crafted earlier.[77] Third, a methodological process opens analysis to "guiding principles of

77 Structured processes provide a framework that reduces the flailing around as analysts seek to find a starting point for their analyses. Morgan Jones discusses this at some length. See Jones, *Thinker's Toolkit,* xi–xvi.

research," enriching both the process and the results.[78]

However, there are dangers to such a paradigm, especially as "science" commonly is understood. As Jeffrey Cooper notes, "a 'science of analysis' is a conceit, partly engendered by Sherman Kent's dominating view of intelligence as a counterpart of the scientific method."[79] Mark and Barbara Stefik argue that "the working methods of science and invention leaves [sic] out imagination. This makes it both boring and misleading."[80] Analysts must focus on both evidence and inferences; otherwise they can "get the details right at the cost of ignoring important inferential judgments that need to be conveyed in order to provide a true sense of the uncertainties of both evidence and judgment."[81] Here again, critical thinking, with its emphasis on creative questioning, moderates the process. Such questioning opens the way for imaginative thinking. "[Intuition], curiosity, and a thirst for discovery – all essential elements of good science" could have alerted analysts working in 1962 (or at any other time) to the possibility that they were being denied or deceived.[82]

An interesting intersection exists between critical thinking and analogy, or drawing comparisons to derive new patterns and explanations. This intersection lies at the heart of creativity.[83] According to Keith Holyoak and Paul Thagard, there are commonly four steps to analogical problem solving:

> Often a problem solver will select a source analog by retrieving information about it from memory (*selection*), map the source to the target and thereby generate inferences about the target

78 Merom, "Estimate," 57.

79 Cooper, Pathologies, 26..

81 Cooper, *Pathologies,* 27.

82 Cooper, *Pathologies,* 31.

83 This statement illustrates just how pervasive and powerful the use of analogy is in human reasoning and discourse. Taken literally, creativity has no heart (nor any other organs) since it is a notion or a concept, not a living animal. Yet the analogy to a living being aids understanding.

(*mapping*), evaluate and adapt the inferences to take account of unique aspects of the target (*evaluation*), and finally learn something more general from the success or failure of the analogy (*learning*).[84]

Since analogy is such a powerful element in human reasoning, how can critical thinking outwit or control it? As developed in this paper, it does so by imposing a structure on the thinking. By examining inferences and implications as well as alternative points of view, critical thinking calls into question the appropriateness of the analogies in use. Recent work by Paul and Elder reveals how this works. They request, for example, that reasoners state and restate explanations, add examples, and then include an analogy.[85] While initial statements about a phenomenon *do not* imply understanding, restatement, examples, and analogies *do* and further, provide measures by which comprehension can be fixed and assessed; they make knowledge explicit – something that can be thought about.[86] When knowledge and reasoning are explicit, assumptions are revealed.

According to Richard Neustadt and Ernest May, it is known that analogy is a tool commonly invoked by policymakers.[87] Critically thinking analysts can add substantively to the policymakers' options by constructively challenging the tendency to rely upon analogy as a way of addressing situations. For example, Neustadt and May observe that in coping with the missile crisis in Cuba, President Kennedy and his advisers relied on – among other things – an analogy to Pearl Harbor to justify why a "surprise" bombing of the Soviet missile

84 Keith J. Holyoak and Paul Thagard, *Mental Leaps: Analogy in Creative Thought* (Cambridge, MA: The MIT Press, 1995), 15. Emphasis in original. Cited hereafter as Holyoak and Thagard, *Mental Leaps.*

bases was *not* a satisfactory option.[88] Kennedy's advisers, acting as analysts of the situation, critically evaluated the appropriateness of the analogy, pointing out its weaknesses and strengths. Kennedy concluded that sneak attacks were not a tactic lying within the U.S. tradition.[89]

In the Cuban case, getting analysts to restate their conclusions, provide examples, and make analogies would have revealed the strengths and weaknesses of their arguments about what they observed from the HUMINT sources. It would have shown their comprehension of what they wanted to conclude, revealed their assumptions and, in so doing, opened an avenue for "alternative" assessments of the issue. It would have done so by causing the analysts to question how it was that they failed to notice or ignore things.[90] The stage would have been set for an earlier, less risky, defusing of the impending crisis.

Another analogy employed in the Cuban missile crisis was the comparison to the Soviet position vis-à-vis the presence of *American* MRBMs in Turkey. A critical review reveals that the Soviet Union had tolerated the presence of these missiles – which had a longer range than those placed in Cuba – since 1957.[91] If the U.S. demanded the removal of the Soviet missiles from Cuba, was not a similar withdrawal of the American missiles from Turkey appropriate? Ultimately, this analogy provided a face-saving solution for the Soviet Union in the negotiations that followed. As a "secret" part of the agreement, the American Jupiter MRBMs were removed from Turkey five months after the Soviet Union removed its missiles from Cuba.[92]

Winners and Losers: The Crisis in Context

A Critical Assessment of the Leaders. In any confrontation there are winners and there are losers. Thinking critically about the confrontation over the Soviet missiles also involves determining who actually won as well as what the other outcomes might have been. Each of the three actors, Castro, Khrushchev, and Kennedy, had a number of interests at stake. In a number of circumstances each stood to gain at the expense of the others. What solutions were the most advantageous to each of the three actors? What were the motivating factors? A speculative – and admittedly simplified – critical comparison, again using Paul and Elder's model (summarized in table 3) illustrates how critical thinking also reveals much about who stood to gain and who stood to lose in the crisis.

Castro. Castro found his country under attack from the United States – both directly through economic sanctions and indirectly by Batista loyalists living in Florida.[93] The previous year the United States had launched an invasion attempt at the Bay of Pigs – which was repulsed. However the attempts by the United States to destabilize or overthrow the Cuban government did not end with their defeat. As Raymond Garthoff observes, "by the spring of 1962 the United States had embarked on a concerted campaign of overt and covert political, economic, psychological, and clandestine operations to weaken the Castro regime…including attempts to assassinate Castro."[94] In short, the United States was doing everything *except* conventional warfare to destroy Castro and his regime.

Castro's point of view was that the United States was a real enemy. He could reasonably assume that in light of its other activities and having attempted an invasion once, the United States would repeat its actions and this time *might* succeed (an implication). Another possible outcome that probably was considered was that war, conventional or nuclear, was likely. Castro must have possessed evidence of the military capabilities of the United States and probably inferred that

Element of Thinking	Considerations as seen from Castro's Point of View
Purpose	· Preserve Regime
Point of View	· United States threatens regime
Assumptions	· A second invasion will be attempted
Implications	· Invasion might succeed · War: conventional or nuclear
Evidence	· U.S. armed forces formidable
Inferences	· U.S. can overcome unaided Cuban forces.
Concepts	· Military strategy and doctrine, communist and capitalist theories
Key Questions	· How to deter United States from invading island

Table 3: A Comparative Assessment of Rival Motivations

Source: Developed by author.

Considerations	
as seen from Khrushchev's Point of View	as seen from Kennedy's Point of View
· Protect Cuba from United States · Force concessions from United States · Remove U.S. and NATO from Berlin · Spread Communism · Preserve Regime	· Get the missiles out of Cuba · Defend U.S. and allies against Communism · Preserve Regime
· United States a threat to Communism · Cuba threatened with invasion	· Communism threatens United States · Missiles are a threat
· Missiles in Cuba bargaining points · Missiles in Cuba protect Castro · Effort will be successful.	· Small Soviet Force · Strategy of removal is possible
· U.S. concessions ·War: conventional or nuclear	· Successful removal · Escalation of measures ·War: conventional or nuclear
· U.S. armed forces formidable	·Administration politically vulnerable over crisis · Khrushchev is a formidable adversary · Khrushchev is bluffing
· U.S. can overcome unaided Cuban forces. · Missiles provide necessary aid · United States will concede.	· Khrushchev will back down · Military option not required
· Military strategy and doctrine, communist and capitalist theories	· Military strategy and doctrine, communist and capitalist theories · Monroe Doctrine
· How to deter United States from invading Cuba · How to dominate the United States	· How to get the Soviets and their missiles off of Cuba

unaided, his own forces were no match for the U.S. forces. Underlying Castro's considerations were a number of ideas about military strategy and doctrine, as well as communist and capitalist theories. A corollary consideration commonly believed by many Americans (at the time and still today) might have been how Communism could have been spread across the Western Hemisphere, especially the United States. Castro's key question was, "How can I prevent the United States from invading again?"

Khrushchev. What motivated Khrushchev remains controversial. His motives certainly were more complex, as various explanatory hypotheses reflect. First, there is the argument that Khrushchev had an ally "in the faith" to protect. He too believed that the United States would invade Cuba a second time.[95] However, as Allison and Zelikow counsel, the troop buildup itself and *not* the nuclear missiles was what Khrushchev did to offset the perceived threat to Cuba from the United States.[96] The deployment of the nuclear missiles was related to some other issue.

Next, the situation posed an opportunity to force concessions from the United States – perhaps about Berlin, or the United States' own offensive missiles located in Europe and Turkey. Allison and Zelikow find sufficient evidence to lead them to believe that removing the U.S. and NATO troops from Berlin was a key factor motivating Khrushchev to deploy the missiles to Cuba.[97] Securing his borders from the American's Jupiter missiles may have been an additional motivating factor.

Additionally, there was Khrushchev's avowed purpose of spreading Communism across the globe. In this context the deployment of weapons lies within the context of "a great power rivalry… between the U.S. and the values and interests it represented…and

95 James J. Wirtz, "Organizing for Crisis Intelligence: Lessons form the Cuban Missile Crisis," in Blight and Welch, *Intelligence and the Cuban Missile Crisis,* 130. Cited hereafter as Wirtz, "Organizing."

97 Allison and Zelikow, *Essence of Decision*, 99–109.

the Soviet Union's communist agenda."[98] At a reception for foreign ambassadors in Moscow in 1956, Khrushchev threatened, "Whether you like it or not, history is on our side. We [the communists] will bury you!"[99] This remark (among others) also reveals an additional purpose: Khrushchev, like all dictators, had to appear stronger than his adversaries – his political survival depended on it.

Khrushchev's point of view was that the United States (and its allies) were a threat to Communism everywhere and needed to be contained. He was presented with a confluence of opportunities and responded with the military buildup in Cuba and the deployment of the missiles. He apparently assumed that if he could get nuclear missiles into Cuba he'd have bargaining points useful in such a containment strategy. Later, Khrushchev believed he could effect a change in the balance of power between the two nations.[100] Possible outcomes included the prospect of further U.S. concessions, protection of Cuba from invasion, and either conventional or nuclear war.

Khrushchev had direct evidence drawn from the Korean War and possibly other evidence from spies operating in the United States about the capability of the U.S. military. Given the nuclear missiles he actually deployed as well as his assignment (temporary) of operational control of those missiles to the Soviet Group of Forces commander, General Issa Pliyev, Khrushchev seems to have inferred the U.S. forces were formidable.[101] He also apparently concluded that the missiles – and the other forces – would be adequate to the task of successfully satisfying his purposes; the United States, faced with

98 Allison and Zelikow, *Essence of Decision*, 88.

99 Nikita Khrushchev, "Speech to Ambassadors at Reception, 17 November 1956," in James Beasley Simpson, compiler, *Simpson's Contemporary Quotations: The most Notable Quotes since 1950* (Boston, MA: Houghton Mifflin Company, 1988), online edition, URL: <http://www.bartleby.com/63/83/183.html>, last accessed 20 April 2006. Ironically, Khrushchev was wrong. History sided with his adversaries.

100 Gribkov, "The View," 4. Control reverted back to Moscow in September.

operational missiles in Cuba, would concede.[102] The concepts on which Khrushchev relied probably were the same as those on which Castro relied: military strategy and doctrine as well as communist and capitalist theories. Again, Khrushchev's key question mirrored that of Castro: How to keep the Americans from invading Cuba. Additionally, there could have been a second question on how to dominate, or at least gain concessions from, the United States.

Kennedy. Finally, there was Kennedy. While Kennedy's exact purpose vis-à-vis Cuba *prior* to the discovery of the missiles also remains unclear, it is known that he did not plan to invade the island during the summer and fall of 1962.[103] However, 1962 was an election year and the Kennedy administration was vulnerable with respect to Cuba.[104] Kennedy could not afford to appear soft on Communism. Kennedy also had an interest in keeping the U.S. and NATO forces in Berlin.

All this changed once the missiles were discovered. Kennedy's deliberations revolved around removing the missiles as expeditiously as possible. He no doubt realized that if his administration bungled the crisis they might lose at the polls in November.[105] Therefore, it is reasonable to conclude that Kennedy's goals included retaining control of Congress – he too had a regime to preserve. Kennedy's point of view was clear: the deployed Soviet strategic nuclear missiles were a threat to the United States and must be removed. He assumed that such a strategy could be developed. He apparently also assumed that the Soviets had placed a *small* force on the island. Possible outcomes included successful removal of the missiles and their

---

105 Hampson, "Divided," 143.

supporting forces, an escalation of measures to prompt that removal, and the possibility of conventional or nuclear war.[106]

Kennedy had evidence of his political vulnerability He also had evidence – Khrushchev's own actions included – that the Soviet leader was a formidable adversary. But based on Penkovsky's evidence he inferred that Khrushchev might be persuaded to back down. As Scott concludes, "various writers contend that Penkovsky's intelligence…[guided] Kennedy's handling of the crisis from a position of strength."[107] This occurred in part because "the KGB's discovery of Penkovsky's espionage alerted Khrushchev to the fact that Kennedy now knew he was bluffing."[108] As has been noted, Kennedy lacked accurate evidence about what was really on the island. Nevertheless as has been noted, he inferred that military strikes were not – at least at that time – an option. Kennedy probably relied on the same concepts on which Castro and Khrushchev relied. In addition, the concepts embodied in the Monroe Doctrine were also probably a factor. Kennedy's key question was, "How to get the Soviets and their missiles out of Cuba?"

Foresight. Viewed with foresight, there were a number of possible outcomes to the crisis based on the inferrable goals that could be associated with any of the three leaders. A win for one of the leaders was not necessarily a loss for the others as table 4 shows. In some cases, achieving one's goal was a win for the leader, but a failure to achieve it was *not* necessarily a loss. "Winning" the crisis should have involved attaining all or most of one's goals. However, since not all goals were of equal importance, failing to achieve one could mean that one lost in the larger crisis. Similarly, achieving one's goals did not guarantee winning the larger crisis. This becomes evident as the actual winners and losers are considered.

missiles in Turkey appeared to increase the security of his borders – an apparent concession from the United States.[109] However, Khrushchev failed to spread Communism further. And Berlin remained partially

109 The issue of the Jupiter missiles is complex. They were not included in the formal agreement but were offered up in a secret unilateral assurance from Kennedy (Garthoff, *Reflections,* 132).

in the hands of the West. If, as Allison and Zelikow postulate, this was the real motivation behind the nuclear deployment then Khrushchev's failure was highly significant. Additionally, his regime was embarrassed by the revelation in the United Nations of the presence of the missiles. Ultimately, he was removed from power two years later and placed under house arrest until his death in 1971. So, Khrushchev, while he won a number of his goals, wound up the overall loser.

Kennedy is the other winner in the crisis. He gets the Soviets missiles removed from Cuba while avoiding war. He is later able to retire an obsolete missile system (the Jupiters). He prevents the Soviet Union from seizing control of Berlin. Finally, his popularity increases and the Democrats retained power in the 1962 elections.

Ten Years Later, They Meet Again

It is worth noting that Soviet denial and deception in support of military deployments and operations in Cuba did not end in the early winter of 1962. In 1970 Henry Kissinger stormed into the office of H. R. Haldeman and demanded to see President Nixon. Aerial reconnaissance had brought news. "The Cubans are building soccer fields," Kissinger said. "Cubans play *baseball*. *Russians* play soccer."[110] The Soviets it seems had been discovered building a submarine base at Cienfuegos. Prior to a particular overflight, that fact had been denied to the United States. The soccer fields were for the recreation of Soviet troops.

Judgment: Critical Thinking Would Have Made a Difference

As this case study makes clear, there are a number of junctures where critical thinking or structured analytic methods could have made a difference in analyzing the Soviet missile deployment to Cuba. While it is true that Sherman Kent argued for a scientific approach to analysis, it does not seem to have been widely practiced at the time.[111] As of 1962, most studies that we now have in hand on human reasoning in intelligence had not been completed. The champions of structured intelligence analysis methods had not yet developed their techniques.

Nevertheless, a study of the crisis is germane because the same kinds of errors *repeat themselves again and again.* The errors seen in the Cuban case – failure to question assumptions, to take seriously the evidence and the patterns they imply, to counterfactually examine analytic implication and consequences, in short to make reflective judgments – also were cited by the Senate in its critique of the 2002 Iraqi WMD estimate.[112] In both cases, deceptions confounded analysts, leading them to wrong conclusions.[113] In the Cuban case the analysts eventually figured it out. This did not occur in the

---

111 Sherman Kent, *Strategic Intelligence for American World Policy* (Princeton, PA: Princeton University Press, 1949), 151–208.

112 In the Cuban situation, the debate between McCone and analysts over the nature of the weapons the Soviets might emplace came close to overcoming these errors. Regarding the Iraqi WMD estimate, the debate between the CIA and the Department of Energy over the use of the aluminum tubes also came close. Unfortunately, the incipient debate focused on the results, not the process. In both cases, the side that was eventually proved right failed to make the now-accepted case.

113 Sherman Kent challenged this assertion in his defense of the original estimate and the process by which it was created. He believed that an earlier revelation of the Soviet actions would have led to an intractable situation. However, an earlier revelation – say in August – would have offered President Kennedy and his advisers more options, particularly more *diplomatic* options. Kent also failed to observe that denial and deception occurred – at least for the record. See Sherman Kent, "A Crucial Estimate Relived," Reprint, *Studies in Intelligence* 36, no. 5 (1992): 111–119.

most recent failure. Critical thinking skills went unused among both generations of analysts.

How Can Intelligence Analysts Employ Critical Thinking?

The Poor Record

Critical thinking is what consumers of intelligence appear to expect when they task producers to examine issues. Corporate consumers require analysts creating intelligence to "[evaluate] a situation, problem, or argument and [choose] a path of investigation that leads to finding the best possible answers."[114] In the national security field, strategic intelligence pioneer Washington Platt notes that "[intelligence] is a meaningful statement derived from information which has been selected, evaluated, interpreted, and finally expressed so that its significance to a current national policy problem is clear."[115] Derived from strategic intelligence, "best answers" should clearly express what is significant to national policy problems. They may also support warfighters with essential operational and tactical intelligence. Critical thinking leads to the best answers for the specific context at hand.

Unfortunately, analysts' biases and mindsets repeatedly obscure best questions and answers. From well before the Japanese surprise attack on Pearl Harbor to the 2002 estimate on Iraqi weapons of mass destruction, a failure to think critically about potential crises contributed to repeated intelligence failures.[116] "Expert analysis"

116 George S. Pettee, *The Future of American Secret Intelligence* (Washington, DC: Infantry Journal Press, 1946). Chapter 1 provides a summary of U.S. intelligence failures during the first half of the 20th Century. While hindsight is an imperfect mirror for reviewing the past, one conclusion to be drawn from a review of the evidence is that critical thinking could have minimized many of the ensuing crises.

was not enough.[117] Biases and mindsets too often converted subject-matter confidence into arrogance; false assumptions blinded analysts to their target's true intentions. For example, at least one CIA Iraq analyst acknowledged that the 1990 invasion of Kuwait,

> was an intelligence failure…We were guilty of a kind of mindset…The idea that a country [Iraq] would march up to the border, put 100,000 troops there, go in and do what they've done; I don't think anybody thought they'd do it.[118]

In 2002, Intelligence Community analysts failed to definitively assess whether the Iraqi government still possessed weapons of mass destruction. The Senate noted in its review of the failure that

> [rather] than thinking imaginatively, and considering seemingly unlikely and unpopular possibilities, the Intelligence Community instead found itself wedded to a set of assumptions about Iraq, focusing on intelligence reporting that appeared to confirm those assumptions.[119]

The mistakes of 2002 also occurred in 1990 – and for that matter in 1941. Analysts failed to question assumptions widely held at the time. Instead they chose the first answer that satisfied the situation, a phenomenon known as "satisficing."[120] Other means by which intelligence analysts and policymaking customers reasoned poorly are listed in table 5. According to Ephraim Kam, the problem is so great that the intelligence analysis process is "consistently biased, and…bias

is the cornerstone of intelligence failures."[121] Paul and Elder claim that much thinking is "biased, distorted, partial, uninformed, or down-right [sic] prejudiced."[122] There are repeated failures to think critically; but could critical thinking about these situations prevent the failures?

Means by Which Decisions are Made
Select first answer that appears "good enough."
Focus on narrow range of alternatives, ignoring need for dramatic change from existing position.
Opt for answer that elicits the greatest agreement and support.
Choose the answer that appears most likely to avoid some previous error or duplicate a previous success.
Rely on a set of principles that distinguish "good" alternatives from "bad" alternatives.

Table 5: How Analysts Decide

Source: Excerpted from Alexander George, *Presidential Decisionmaking in Foreign Policy: The Effective Use of Information and Advice* (Boulder, CO: Westview Press, 1980), Chapter 2.

Critical thinking helps mitigate the effects of mindsets and biases by invoking skillful examination of evidence both for and against an issue, as well as consideration of obvious and less obvious alternative explanations. In the 1990 example, thinking critically would have raised other possible explanations for why Hussein's troops were on the Kuwaiti border and what he intended for them to do.[123] That the Iraqi troops were trained by the former Soviet Union and followed its tactics might have been an indicator of future intentions. In the case of the weapons of mass destruction (WMD), analysts might have

121 Ephraim Kam, Surprise Attack: The Victim's Perspective (Cambridge, MA: Harvard University Press, 1990), 85.

122 Paul and Elder, *Concepts and Tools,* 1.

123 A consideration of who trained Hussein's troops – in this case, the Soviet Union – might have led to an examination of military doctrine. Thus, it quickly would have become clear that troops mobilized on a border were going to cross that border. Analysts would then have known that an invasion of Kuwait was imminent.

asked, as they realized they had no new evidence of the weapons, "How can we prove that the weapons of mass destruction definitely are not there?" or "What would we expect to see if Saddam Hussein had gotten rid of his weapons of mass destruction?"[124]

We must assume that analysts can be encouraged to think in this manner. Modern strategic intelligence pioneer Sherman Kent believed this to be the case when he wrote nearly 60 years ago that intelligence analysts "are supposed to have had more training in the techniques of guarding against their own intellectual frailties" than the larger populace.[125]

Assessing Evidence[126]

Understanding how evidence is assessed is a necessary first step in understanding how analysts can better reason with and about it. The incomplete and ambiguous information and data with which intelligence professionals work compounds their reasoning process.[127] Sources are unreliable and contradictory; adversarial denial and deception increase doubt. When information and data are questionable, derived evidence is even more uncertain, and inferences arising from that evidence may be highly suspect. One way that analysts can reduce this uncertainty is by building defensible inferences

---

124 These analyses are those of the author. The last question was jointly arrived at in a conversation between the author and Mark Lowenthal, 26 July 2005.

125 Sherman Kent, *Strategic Intelligence for American World Policy* (Princeton, NJ: Princeton University Press, 1949), 199.

126 This section is based (with additions) on materials developed by Francis J. Hughes and the author for a structured analytic methods course taught at the National Defense Intelligence College. For a deeper examination of evidence assessment see Francis J. Hughes and David A. Schum, *Credibility Assessment: A First Step in Intelligence Analysis,* unpublished tutorial, National Defense Intelligence College, April 2003.

127 Information, data, and evidence are different kinds of knowledge. Pieces of information comprise data, which in turn comprise evidence. Evidence is further distinguished from data by the fact that it contributes to discrimination among alternative end states. Data, while relevant, do not necessarily allow discrimination.

TESTIMONIAL: APPLYING CRITICAL THINKING

This is a true story. All the characters are real and really naive.

As a fresh graduate of NSA's critical thinking and structured analysis class, I attended an Intelligence Community class on counterintelligence. My fellow students included folks from all over the community, including CIA and FBI case officers. During the class, the instructor put forth a case study for students to think about and decide how best to "analyze and investigate" to find the mole. Differing opinions surfaced, but a common thread appeared among the case officers: follow your "gut" feeling and collect evidence to support that assumption, no matter how long it took.

The instructor, enjoying the collective mindset and the opportunity to shatter paradigms, concentrated on how information was collected and analyzed. Again, the case officers agreed the best solution was to continue gathering information until you "proved your case." I, the lone NSA token student, raised my objection, "How long is long enough? Until you've ruined the career of innocent, hardworking persons in the IC, or until you find another answer you like?" Although it did not earn me friends, it did open up a window to inform these case officers and other attendees about the intricacies of analysis.

Critical thinking is not just about putting information together, finding a pattern, then choosing an answer, it is about reducing bias, considering all options available, and presenting options to a decision–maker. And critical thinking is about paying attention to what and how you are doing it. I reasoned that, since the investigators in the case study concentrated on only one

Source: A mid–level intelligence professional at the National Security Agency

from the evidence. At their most basic level, these inferences depend on credibility (can it be believed), relevance (does the evidence bear on the issue), and inferential or probative force (how compelling is it in answering the questions raised by the issue). Unfortunately, no mass or body of evidence – in intelligence or anywhere else – comes with these three properties already established. Establishment of these properties to abet uncertainty reduction through inference occurs only through a process of argument, creative hypothesis generation, and the development of chains of reasoning.

Authenticity, accuracy, and reliability represent criteria for establishing the credibility of tangible evidence.[128] An analyst striving

128 "Tangible evidence" is a technical term describing *things* that bear relevance to an issue under scrutiny. It is contrasted with "testimonial evidence"

person, the analysis was faulty because somewhere along the line they limited their suspects (introduced bias) regardless of reason (access, family connections, angel–like qualities, etc.). Although it would take time, the investigators should conduct quantitative and qualitative analysis, make a decision tree (options open to a mole in a heavy security environment), and then play Devil's Advocate. In addition, analysis never reveals one "solution" or "smoking gun"; it leads to two or three "options" which can be investigated in detail.

The instructor, pleased that someone in the class knew what the "Analysis of Competing Hypotheses" was, revealed the answers of the real–life case study: after three years of investigating, the case officers had the wrong person due to incorrect information in old reports and limiting their suspect list. Instead of going back to the original source information, the officers read old reports that were unfortunately biased by Agency politics and external societal events (1950–60s). The real mole was discovered over a decade later; he was the son of a former Agency chief, well educated and well liked, but did not have access to the information. The individual "borrowed" interesting reports from friends who had access, covered his tracks, and continued spying against the U.S. for several years. Just as the authorities were about to arrest him, he was found dead in a hotel room from a reported suicide, but the cops could not figure out how he had two bullets in his chest and one in the back of his head. Miracle suicide.

What is the moral of the story? Conduct a thorough analysis right the first time and you can catch a mole anytime. I only hope the attending case officers got the message, especially from a non–gun toting NSA analyst.

who wishes to remain anonymous, email to the author, 9 March 2006.

to determine authenticity may ask, "Is the evidence what it seems to be?" In determining accuracy, the key question is whether the piece of evidence or the system that produced it has the resolution to reveal what the analyst believes the event or record should reveal. Assessing reliability involves determining whether different means of collection produce the same results.

If, on the other hand, the evidence is testimonial, different criteria apply. The first thing to be established is whether the source is being truthful. Truthfulness is not absolute. Rather, it is time- and context-dependent. A source may believe he is being truthful about an issue or may have legitimate reasons to be untruthful about that issue. In

– what people say about the issue.

another time and about another issue, these impediments to veracity may not exist for that source. Therefore, establishing the truthfulness of a source can pose a significant challenge to the analyst.

In an ideal situation, a review of evidentiary relevance causes an analyst to examine the likelihood of any potential answer to the problem or question – a hypothesis – with an eye to the modification of existing hypotheses or even the invention of new ones. In other words, an analyst might theorize that a certain bit of evidence will indicate that an individual or a group of individuals will engage in nefarious activity. Yet, if none of the evidence at hand bears on the issue, then the analyst may need to reconsider – or even reject – this evidence based on its lack of relevance. The analyst also should consider that the individual *may not* engage in the activity.

What is true about the future is also true about the present and the past. A lack of evidence relevant to an issue should prompt analysts to reassess their theories about the issue at hand. For example, an unnamed FBI investigator in the 2001 anthrax case noted, "[Reasoning] says that if you think a person is your guy, but you can't find anything to put him in the game, you've got to keep looking at others."[129] The failure of the FBI to implicate its principal suspect forced it to consider other explanations as to who sent the anthrax-laden letters in September 2001 to political leaders and media figures.

The analyst also is concerned with how strongly the evidence

129 Allan Lengel and Guy Gugliotta, "Md. Pond Produces No Anthrax Microbes: FBI Sought Clues In Deadly Attacks," *Washington Post*, 1 August 2003, A03. Cited hereafter as *Washington Post,* "No Anthrax." While this is a law-enforcement example, it illustrates good critical questioning about an apparent lack of evidence. Criminal investigation and intelligence analysis similarly assess events and evidence with the goal of description, explanation, and interpretation. The principal difference is that intelligence analysis endeavors to do so *before* the event occurs – in other words, *to estimate.* It is worth noting that over two years after the pond was drained the case remains unsolved; the individual under suspicion at the time was never charged with the crime. The FBI was unable to link the evidence to the individual. See for example, Allan Lengel, "Little Progress In FBI Probe of Anthrax Attacks: Internal Report Compiled As Agents Hope for a Break," *Washington Post,* 16 September 2005, A01.

undermines or supports the particular hypotheses under examination – the probative force of the evidence. Certain evidence, coming from certain kinds of sources, persuades more strongly than does other evidence drawn from other sources. Tangible evidence might have greater probative force than testimonial evidence. Consider, for example, a hypothetical biological weapons issue. Traces of certain toxic substances found near an alleged biological weapons lab carry greater probative force than the testimonial denials of the government of the country in which the lab and the samples were found.

The "ideal" analyst also assesses the objectivity, observational sensitivity, and competence of sources. One question suitable for this assessment is how biases may have corrupted a source's objectivity. Did the source see or hear the evidence directly, and under what conditions did this occur? A reality check also is made at this point. Does it makes sense that a particular source claims to have been in a position to make the observation or have access to the source of information?

Another consideration involves denial and deception. In assessing the evidence, the analyst should ask, "What is the likelihood that I am being deceived? This question is surprisingly difficult to answer accurately. Given that anchoring biases and confirmation heuristics cause analysts to find what they seek to find, a denial and deception hypothesis is often easily proved.[130] Critical thinking challenges this by forcing an examination of alternative points of view. For intelligence analysts, proactive, focused and surreptitious collection of information about the often minimal disconfirming evidence pays rich dividends.[131] In this case, the question becomes, "What is the likelihood that I am *not* being deceived?" Thus engaged, really good intelligence analysts create valuable knowledge.

Facilitating Evidentiary Assessment

The questions that need to be asked about each piece of evidence are the same as those employed in critical thinking. In making her evaluation of what constitutes evidence, the analyst repeatedly asks "why": "Why do I believe this information is relevant to the question at hand (either against or for) and therefore exists as evidence?" "Why do I believe the source to be credible?" Additional questions about the analyst's own thinking processes might arise, such as: "What are my biases and why do they lead me to think this way?"

For example, in assessing the intentions of former Iraqi dictator Saddam Hussein in light of the U.S. destruction of his intelligence headquarters in 1993, an analyst might ask whether Hussein's declarations not to retaliate against the United States were credible. A corollary question might be, "What does Saddam Hussein gain by denial and deception?" Based on Hussein's statement, a determination that additional evidence was needed would stimulate collection of similar statements from other episodes. By analyzing what Hussein did in those instances, the analyst might determine that he was usually untruthful. Therefore, this piece of evidence would be deemed to be of low credibility despite its probative force, and relevance to the determination whether Hussein would or would not retaliate.[132] In other words, Hussein's statement might reflect an ongoing deception campaign. To explore this hypothesis further, the analyst might seek to determine whether increases in Iraqi agent communications were relevant to the issue and whether additional collection of such broadcasts was warranted.[133]

In practice, these and similar questions can be answered quickly. Analysts often answer some of them unconsciously as they struggle

132 Heuer develops this scenario and evidence in an example of the analysis of competing hypotheses. See Heuer, *Psychology*, 101–102.

133 Heuer, *Psychology,* 101–102. For a recent detailed look at Saddam Hussein and deception see Kevin Woods, James Lacey, and Williamson Murray, "Saddam's Delusions: The View from the Inside," *Foreign Affairs* 85, no. 3 (May/June 2006). URL: <http://www.foreignaffairs.org/20060501faessay85301/kevin-woods-james-lacey-williamson-murray/sadda-s-delusions-the-view-from-the-inside.html>, last accessed 31 March 2006.

to meet short deadlines. However, as a function of not employing scientific methods or other structured and critical thinking techniques, their thinking is largely intuitive. Analysts choose to ignore how mindsets and assumptions impede their judgments. Conversely, critical thinking ensures that the reasoning process is a self-conscious one. By making the unconscious conscious, analysts reveal where they may be biased, helping ensure that questions they address are thoroughly and fairly considered.

Each method of analysis uniquely interacts with the intelligence question; therefore, the method (or methods) selected can produce profoundly different results – affecting the analyst's arrival at the most accurate answer.

An analyst committed to critical thinking continually asks questions while developing the mass of evidence needed to assess an issue. Evidence arises from questions answered satisfactorily. Information for which the questions cannot satisfactorily be answered is excluded – but only after the analyst reflects on the process of evidence development. Consideration is owed to the question of how biases, and possibly active denial and deception by an adversary, have influenced the selection of both questions and answers. One way of revealing bias is by asking questions such as, "If the opposite outcome is actually true, what other evidence would I expect to see?"

The marshaling of evidence refers to a questioning process by which data and information are assessed and evidence is created. It may be done in solitary fashion, Socratically with a teammate, or collegially among Intelligence Community focus groups. It is a vital ingredient of productively imaginative intelligence analysis. Each question an analyst asks not only becomes a device for attracting existing evidence, but also generates new evidence not yet visible. Identifying new evidence increases the thoroughness by which the issue is evaluated and increases the probability that the correct solution has been discovered.

Embracing a Methodology

Once a relevant mass of evidence is established, the analyst evaluates which method or methods of analysis may best develop

a solution to the issue. Differences among various analytic methodologies, techniques, and tools are not trivial.

In fact, comparing the results of different analysis methods can be a valid means of establishing the accuracy of the answer. If various means of analysis yield multiple results, a review by different analysts makes for the ideal environment for critical thinking to discuss and debate those results.[134]

Therefore, assessment of the available evidence includes redirecting thinking, soliciting feedback from other sources, appraising the quality of possible answers, and comparing initial goals with results. In so doing an analyst employs interpretive and evaluative skills to select the best mass of evidence to analyze.

Creating Better Inferences

Critical thinking aims to ensure that inferences are reasonable and evidence-based. Inference creation begins at the same time that analysis starts. As each piece, or the whole mass of evidence, is considered, inferences are made.[135] Resulting "chains" of inferences linking the evidence to the hypotheses under consideration are known as arguments. Chains of inferences converge – strengthening the argument – or diverge – weakening it. The self-reflective nature of critical thinking places a check on these inferences. The analyst asks, "Do my inferences flow from the evidence?" and, "Are my inferences logical given the evidence and other inferences I have made?"

Inferences lead to a search for additional evidence. In other words, based on inferences drawn from the evidence at hand, an analyst may infer that there are other sources of evidence to consider. For example, such reasoning was cited in the explanation of why

134 For a more detailed discussion of this and other means of countering biases, see Heuer, *Psychology*, 170–184; Irving Janis, *Groupthink: Psychological Studies of Policy Decisions and Fiascoes*, 2nd Edition (Boston, MA: Houghton Mifflin Company, 1982); and Scott Plous, *The Psychology of Judgment and Decision-making* (New York, NY: McGraw Hill, Inc., 1993).

135 Indeed, the analyst's acceptance – or rejection – of this evidence is a result of inferences: either the evidence is valid, credible, and relevant, or it is not.

the FBI investigated a pond in western Maryland during June 2003, searching for the source of the 2001 anthrax attacks. At the time, the FBI believed their primary suspect lived near the pond in question. In their search for additional evidence, they reasoned that the pond might be something in which evidence had been hidden. Thus, inference led the FBI to drain the pond to search for that evidence.[136]

The analyst self-consciously evaluates the thinking process and the biases that have affected it to reduce unproductive thinking and to consciously develop new ways of understanding the evidence at hand. This self-regulation also plays a role as the available evidence is considered. A means of accomplishing this within a collaborative setting is to seek the assistance of colleagues of diverse backgrounds. The underlying premise is that their biases differ sufficiently to enable productive and thorough analysis to occur.[137]

Producing Intelligence

Analysts who produce intelligence assessments and judgments have the opportunity to employ what Peter Facione considers the core cognitive skills of critical thinking: interpretation, analysis, evaluation, inference, explanation, and self-regulation.[138] Each of these competencies contributes to the integration of available evidence through a clear line of reasoning to the most probable answer.

Facione asserts that good critical thinkers can explain "what they think and how they arrived at that judgment."[139] By documenting the

139 Facione, *Critical Thinking,* 5.

reasoning process used to arrive at an answer, analysts move beyond merely "stating results [to] justifying procedures, and presenting arguments."[140] Questioning biases and mindsets encourages consideration of alternative possibilities that overcome what Josh Kerbel refers to as "single–outcome [analytic] trajectories."[141] Most importantly, analysts demonstrate a critical spirit – a reflection of character.[142]

Thus, critical thinking contributes to short-term analysis and assumes an essential role in longer-term analysis. Indeed, building a comprehensive picture of an issue or target requires critical thinking to determine which previous reports are included or excluded. "How do the parts contribute to the whole?" is one question the analyst asks. Another is, "How is the whole greater than the sum of its parts?" When previously published intelligence reports diverge, the critical thinking process helps the analyst ensure that the divergence is considered fairly and that the resulting intelligence does not merely satisfice.

How can Analysts be Taught to Think Critically?

Many people would rather die than think – in fact, they do.

—Bertrand Russell

Critical Thinking Education Outside the Intelligence Community

Critical thinking offers a framework for structured problem solving. Yet, despite a corpus of associated literature, critical thinking remains in its infancy as a discipline. It is still "largely misunderstood…existing more in stereotype than in substance, more in image than in reality."[143] As Bertrand Russell's humorous quip reminds us, critical thinking is not a habit acquired by just being alive.

Ideally, valuable skills and dispositions should be developed among prospective analysts before they join intelligence-producing corporations. Yet, observations by the author of newly hired intelligence analysts suggest this happens rarely if at all. This raises two questions, "What are the opportunities for prospective analysts to become critical thinkers before they are hired?" and often "Why do these opportunities not exist?"

Despite its importance, critical thinking is not widely taught in schools and universities. A mid-1990s California study on the role of critical thinking in the curricula of 38 public and 28 private universities concluded that the skill is "clearly an honorific phrase in the minds of most educators."[144] The study concluded that university

143 Richard W. Paul, "A Draft Statement of Principles," The National Council for Excellence in Critical Thinking, URL: <www.criticalthinking.org/ncect.html>, last accessed March 18, 2003. The reasons why critical thinking remains an undeveloped discipline while important, go beyond the scope of this essay and are not addressed.

144 Richard W. Paul, Linda Elder, and Ted Bartell, "Executive Summary,

faculty members "feel obliged to claim both familiarity with it and commitment to it in their teaching, despite the fact that…most have only a vague understanding of what it is and what is involved in bringing it successfully into instruction."[145] Indeed, the authors of the study found that while 89% of the faculty they interviewed "claimed critical thinking was the primary objective of their instruction," only 19% could define the term and only 9% were evidently using it on a daily basis in their instruction.[146] If the results of the California study are representative of the nation at large, they explain why prospective new hires – themselves college graduates – generally fail to exhibit skill in critical thinking at any level of proficiency.[147]

Informal conversations with recent hires at NSA support this premise. Although slightly fewer than half of these individuals indicate they have been exposed to critical thinking skills in college, most have been exposed only in one class and then only as an approach to learning the materials covered in that class. While not discouraged, respondents apparently were not encouraged to apply the skills to other subjects. Thus, a disposition to think critically is rarely fostered. Further, when asked to define critical thinking, most

Study of 38 Public Universities and 28 Private Universities To Determine Faculty Emphasis on Critical Thinking In Instruction," *California Teacher Preparation for Instruction in Critical Thinking: Research Findings and Policy Recommendations,* California Commission on Teacher Credentialing, Sacramento California, 1997 (Dillon, CA: Foundation for Critical Thinking, 1997), URL: <criticalthinking.org/schoolstudy.htm>, last accessed March 18, 2003. 147 A recent but unscientific survey of several major eastern American universities' online catalogs shows the term "critical thinking" to be used widely in course descriptions. Further examination of some of those courses suggests that East Coast academics may share a similar lack of understanding about critical thinking. Although beyond the purview of this paper, it appears that there is sufficient evidence to warrant repeating the California survey on a national basis.

young analysts were unable to do so in any comprehensive fashion.[148] Finally, few employ any form of critical thinking in their analytic (or other) reasoning unless they have been trained to do so.

In fairness, it should be noted that critical thinking awareness, attitude, and skills varies from one academic discipline to another. For example, students of the physical sciences who employ the scientific method in a community setting probably have a greater inclination toward a basic form of critical thinking if only through osmosis.[149]

There are also some primary, secondary, and university education programs that have adopted a meta-cognitive critical thinking paradigm. Although the results of the impact of such programs are largely anecdotal, at least one study, conducted by Jennifer Reed as part of her dissertation found that students' critical thinking skills improved *after just one course.*[150] Faculty and administrators of these programs routinely attend the annual critical thinking conference sponsored by the Center for Critical Thinking where their results are shared. However, the approximately 500 people who attend this international event represent a small fraction of the educators in the United States.

The elements of scientific method – the formulation of hypotheses, collection of relevant data, testing and evaluation of hypotheses, and the logical derivation of conclusions – are matched step-by-step by

148 These conversations occur routinely as part of a training course the author teaches to newly hired intelligence and language analysts at NSA. When asked to complete the following statement, "In my opinion, critical thinking involves…" typical answers center on "thinking outside the box."

149 Francis J. Hughes, conversation with the author, Washington, DC: National Defense Intelligence College, 8 May 2003. Mr. Hughes is one of the few proponents and teachers of evidence-based inferential intelligence analysis, a means of analysis requiring critical thinking at every stage in the process.

150 Jennifer H. Reed, *Effect of a Model For Critical Thinking on Student Achievement In Primary Source Document Analysis And Interpretation, Argumentative Reasoning, Critical Thinking Dispositions, And History Content in a Community College History Course,* PhD Dissertation, College of Education, University of South Florida, December 1998, vii. URL: <http://www.criticalthinking.org/resources/JReed-Dissertation.pdf>, last accessed 6 May 2006.

critical thinking.[151] Given that most newly hired intelligence analysts – at least at NSA – are drawn from fields other than the physical sciences, one can expect that new hires lack adequate critical thinking skills. If NSA's newly hired intelligence analysts are representative of those being hired across the Intelligence Community then it is probable that few of the thousands of new hires arrive with adequate critical thinking skills.

Critical Thinking Education Inside the Intelligence Community

That analysts need to develop critical thinking skills is recognized within the Intelligence Community. Heuer wrote in 1999, "[Traditionally], analysts at all levels devote little attention to improving how they think."[152] As a direct response to Heuer's criticism, the CIA's Sherman Kent School includes critical thinking as part of the curricula for training new analysts, and recently initiated a class in critical thinking.[153] New employees are encouraged to develop a disposition to think critically as they are taught the skills of intelligence analysis.

A similar approach is employed in courses on structured analysis methods at the National Defense Intelligence College (NDIC). Critical thinking is claimed as a feature of many NDIC courses. However, the emphasis in most courses is on topical or issue-related material, and only incidentally on the process of thinking. At present, the skill itself is largely not taught. Instead, students are expected to figure

153 For a detailed account of how the faculty of the CIA's Sherman Kent School are working to improve their analysts' knowledge, skills, and abilities, see Stephen D. Marrin, "CIA's Kent School: Improving Training for New Analysts," *International Journal of Intelligence and Counter Intelligence* 16, no. 4 (Winter 2003–2004): 609–637.

it out on their own, encouraged by the thesis writing process. The college is aware of the importance of critical thinking and new core courses may include formal critical thinking instruction.

New NSA analysts are provided with an introduction to the solitary part of the skill (as discussed in figure 4) as part of their orientation. The agency's 40-hour follow-on program is the first Intelligence Community course to focus primarily on enhancing analysts' solitary and communal critical thinking skills. In addition to critical thinking skills, participants learn and apply, and then assess, the appropriateness of fourteen structured methods of analysis. The course has been taught to both U.S. and Allied personnel drawn from intelligence, counterintelligence, information assurance, and law enforcement communities.[154]

Training in critical thinking is offered to Defense Intelligence Agency (DIA) analysts using a variation of the NSA-developed course. Also, in 2005, DIA tested the "critical thinking skills" of a sample of its employees using the *Watson-Glaser Critical Thinking Appraisal*. The instrument claims to "measure abilities involved in critical thinking, including the abilities to define problems, select important information for the solution to problems, recognize stated and unstated assumption, formulate and select relevant and promising hypotheses, [and] draw valid conclusions and judge the validity of inferences."[155] The appraisal appears to confuse abilities with skills, although both do belong within the domain of analysis.[156] Finally, it appears that the test does not evaluate an individual's meta-cognitive skills in assessing and correcting the *process* of reasoning.

The increasing opportunities for enhancing critical thinking skills and dispositions reflect a recognition of the importance of critical

---

156 Abilities and skills are easily differentiated. Individuals are born with certain abilities (and can improve them through training) but they *must* learn a skill. See for example, Moore and Krizan, "NSA."

thinking in intelligence analysis.[157] Evidence becomes intelligence through an "ordered thinking process [involving] careful judgments or judicious evaluations leading to defensible conclusions" – through critical thinking.[158] Former CIA analyst Morgan Jones asserts that methods for critical thinking and problem solving, if applied, can improve the quality of analysis and decisionmaking.[159]

Implications of Teaching Critical Thinking

Although Sherman Kent, Richards J. Heuer, Jr., and others have over the years addressed intelligence analysis and its relationship with critical thinking, recent presidential executive orders and legislative mandates are bringing a new emphasis to how the Intelligence Community can change analytic practices to achieve improved outcomes. Teaching analysts to be better critical thinkers may be seen as an easy way to satisfy these requirements. However, linkages between intelligence analysis and critical thinking remain poorly understood. Considerable confusion remains about what constitutes critical thinking and how it supports intelligence analysis.

A common excuse among analysts to defend their "non-use of such self-conscious processes is a lack of time."[160] Teaching critical thinking skills is of little value if analysts are not inclined to use them.[161] For those who are willing to think critically, various

157 The Director of National Intelligence, John D. Negroponte, in the Foreword of the initial *National Intelligence Strategy of the United States of America* (Washington, DC: Office of the DNI, October 2005), wrote that one of the three principal tasks for the reformed Intelligence Community is to "bring more depth and accuracy to intelligence analysis." See http://www.dni.gov/NISOctober2005.pdf.

160 Stephen Marrin, email to the author, December 8, 2003. The author has heard similar complaints from analysts at NSA and DIA.

161 Linda Elder, Alec Fisher, Diane Halpern, Gerald Nosich, Richard Paul, and others develop and publish the materials for – as well as teach – such courses.

instructional models offer complementary means of expanding and enhancing analysts' skills. For example, in an area studies class on Russia, students might be asked to evaluate and comment in depth on what different sources say about the influence of organized crime on the national government. Alternatively, critical thinking can be injected into the course as part of a problem-solving curriculum. Here students focus on *how* they think as they apply different strategies to each assignment, and then, ideally, transfer those enhanced skills to their day-to-day analysis. The use of realistic case studies makes classroom-acquired knowledge actionable. Self-reflective and group-reflective analyses of the process of reasoning keep the classes focused toward the working environment of analysts.

Such transformations involve behavior modification and as such take time. Participants engaged in such instruction cannot be expected to become critical thinkers in a one-day or even a week-long course. The instructors of the NSA course attempt over a period of 10 weeks to transform their students into critical thinkers. Some other Community efforts also provide instruction over an extended period. Even so, students leaving the course are still novices in this practice and can slip back to their old methods of reasoning. Becoming critical thinkers requires a change in behavior that extends long past the end of the formal instruction. There is no substitute for continued practice.

Finally, it serves critically thinking analysts poorly if their management and corporations are indisposed toward the application of the skills. It is well known that "engendering the desire to use [critical thinking] as a favored means of problem solving and decision making prepares the ground for teaching and learning the [critical thinking] skills."[162] Such encouragement can occur in the classroom but its effectiveness is limited unless the corporation encourages and welcomes strategies to employ critical thinking in the workplace.

However, there are few metrics for determining the effectiveness of these materials and courses and so their value remains undetermined. The fact that the books developed for, and used in, such courses remain in print (in successive editions) is an indicator that at least this approach is popular, if not effective.

162 Facione, "Disposition."

The best place for such encouragement is from senior and midlevel management. In order for this to occur, they too must be educated in the methods of, and reasons for, critical thinking.

Evaluating Teaching Models

Removing analysts from their work for education and training disrupts their primary mission of intelligence production. Spreading instruction over time provides a reasonable answer to this dilemma. Since improving critical thinking requires a high level of experiential, hands-on practice, an extended course offers students time to practice and apply what they are learning. This is the model used for the NSA course on critical thinking. Feedback from students indicates that once-a-week instruction works best. Mission is minimally disrupted and there is time to study and practice what is being taught. However, the long duration limits students' work-related travel and leave.

Experiential learning also requires that such classes be relatively small and that instructors be proficient. Without a large teaching staff, training a large workforce takes years. Since senior managers – and their strategic visions – change often, a long-term corporate commitment is crucial to success.[163]

Such a long-term commitment exists at the Sherman Kent School for Intelligence Analysis. The school itself grew out of a month-long course on analytic tradecraft developed by former Deputy Director for Intelligence Douglas J. MacEachin.[164] Beginning in 1996, the course was delivered to the entire analytic workforce. The school itself was established in 2000 and continues to evolve as both a training center and a center of best analytic practices.[165]

---

163 Alternately, a large staff can be created, trained, and assigned to teach an entire workforce. This was accomplished in a knowledge domain at NSA in the 1990s. If inducements and cultural change accompanied such a program, this approach might present certain advantages even if its costs are high. An analytic workforce could be transformed rapidly through such a "boot camp" approach.

164 Marrin, "Kent School," 615.

165 Marrin, "Kent School," 609.

Another means of critical thinking instruction is to create an interactive, computer-based or web-based course. This has the benefit of allowing as many analysts to attend as wish to do so. One or two instructors working full-time can answer students' questions. Exercises allow student self-assessment. However, this is presently an unsatisfactory model for critical thinking instruction. Learning to think critically requires Socratic interaction and the impersonal nature of web-based instruction discourages the practice even for the population of dedicated solitary learners. In the future, multi-player simulations and other games could be used to reinforce the lessons learned. However, these are not yet available.

Although computer- and web-based instruction can be accomplished at the analyst's desk, there are other reasons why this may not be a good idea. Analysts who remain in their offices are subject to interruptions. Further, course work is often relegated to the end of the workday, when analysts are tired and learning is impaired. Little learning occurs when taking a class is a chore. The current limitations of both classroom and computer- or web-based education suggest that experimentation with new means of instruction for critical thinking is needed.

Encouraging Analysts to Think Critically

Incorporating critical thinking into both orientation and basic analyst education and training is one way to help newly hired analysts develop their skills. Subsequently placing those analysts in offices where critical thinking is practiced is another way to encourage an analytic culture that fosters thinking critically. Through direct exposure to successful, experienced analysts, junior analysts' doubts about the employment of critical thinking techniques can be overcome.

"Skills pay" can be an inducement for analysts to learn and then employ critical thinking. Rewarding the acquisition, maintenance, and use of other special skills is common in government and industry. For example, linguists at NSA earn significant bonuses for achieving specific levels of foreign-language proficiency – an effective way

to maintain critical language competencies within one intelligence agency's workforce. Given the high-level concern for the health of the intelligence analysis process, direct monetary incentives should be available for analysts to master new tools and demonstrate constructive analytical behaviors.

On the other hand, if an intelligence enterprise fails to recognize and reward the acquisition and application of analytic skills such as critical thinking, it sends a very clear message: the enterprise does not value those skills. Faced with such a message and a lack of inducements to excel, the best and brightest analysts may leave, especially from the more junior ranks – and midlevel employees with families and mortgages may "retire in place." Either outcome hurts mission-critical functions, and can be avoided. As a previous Director of NSA, Air Force Lieutenant General Kenneth A. Minihan, noted, "If we don't win the talent war, it doesn't matter what we invest in the infrastructure."[166] Recognizing and rewarding critical thinkers is one way to win that talent war – with the assumption that really good analysts are more likely to remain active within their intelligence agency workforces.

If an analyst adopts a congeries of skills that contributes to the mastery of critical thinking, and is compensated monetarily, that mastery needs to be certified. If a curriculum that drives the acquisition of those skills is in place, then an assessment of those skills can be administered in-house. Specific tests exist for the assessment of critical thinking, such as the "Thinking Skills Assessment Test."[167]

Persuading to Improve Analysis

Teaching critical thinking is but a first step toward improving analysis. Because analysts and managers have different needs and

166 LtGen Kenneth A. Minihan, USAF, Director, NSA, in Robert K. Ackerman, "Security Agency Transitions from Backer to Participant," *Signal* 53, no. 2 (October 1998), 23.

167 For more information, see http://tsa.ucles.org.uk/index.html, last accessed 15 March 2006.

time constraints, multiple versions of a course are needed to meet the needs of each group. Analysts and first-line supervisors may take an entire course, midlevel managers an abbreviated course, and senior managers an overview. This strategy already is employed at the CIA's Sherman Kent School where new employees spend 13 weeks learning analysis skills, techniques, and methods while supervisors, depending on their seniority, spend three days or one day becoming familiar with these same skills and methods. The analysts also have opportunities to apply new skills immediately as they perform four-week "internships" in various CIA offices.

Other CIA analysts, already in place, do not have the same opportunities to receive this training. Thus a two-tiered analyst population with more skilled junior analysts and more knowledgeable senior analysts is being created. Ideally, each will transfer skills and knowledge to the others. However, an alternate possibility is that it will generate distrust and animosity between the two groups. Older, more experienced analysts may resent the opportunities given to their newer counterparts. This issue is not trivial. Offering the wrong curriculum to the wrong groups of analysts and managers can destroy its effectiveness. Managers in the CIA and elsewhere can influence how the new analytic methods being taught will be adopted, as agencies respond to new legislative and executive mandates.

Will analysts embrace critical thinking as a means to improve their analysis? There are numerous observations of analysts' reluctance to adopt new paradigms.[168] This is true even when analysts are confronted with the fact that their conclusions were wrong. In referring to her work on the issue of Iraqi WMD, one CIA analyst told Senate investigators, "their 'bottom line' judgments would have remained the same."[169] Rob Johnston also found a similar reluctance to change opinions among the analysts he studied. He noted that

168 Stephen Marrin, "Homeland Security and the Analysis of Foreign Intelligence," Markle Foundation Task Force on National Security in the Information Age, 15 July 2002, URL: <www.markletaskforce.org /documents/ marrin_071502.pdf>, last accessed December 9, 2003, 9. 169 SSCI, *Iraq,* 299.

although "analysts can change an opinion based on new information or by revisiting old information with a new hypothesis," they perceive a loss of trust and respect and a subsequent loss of "social capital, or power, within [their] group."[170]

Yet, a case can be made that analysts, and especially experienced analysts, will benefit the most from enhanced critical thinking skills training. These are the analysts who are in positions of technical leadership, who work the most difficult aspects of complex targets. There may be significant consequences if they fail to notice and make sense of an issue. On the other hand, the fact that many of these senior personnel will soon be eligible for retirement raises an important question: Does the corporation get added value from teaching analysts who will soon retire to think more critically in their analysis if they are predisposed not to do so? Maybe so. Heuer, while the head of CIA's Methods and Forecasting Division found that analysts, once persuaded to use new analytic methods, found them "interesting and well worth doing."[171]

Other intelligence analysts have adopted new analytic methods that add value to their analyses. In one example, NSA personnel involved in research and development adopted a means of matching target characteristics and their vulnerabilities with exploitation capabilities and their costs.[172] Such analyses helped ensure that appropriate resources were dedicated to collection and that such collection was better tailored to production analysts' needs. However, some research analysts initially refused to employ the model, claiming it took too much time even as it reduced the volumes of information

172 In this context, a "target" refers to an entity – geographical, individual, or topical – in which the Intelligence Community has an interest.

they were required to examine.[173] Adoption of the analytic paradigm required appropriate persuasion.

One interesting means of self-persuasion may be analysts' frustration with the really hard problem. This frustration may lead analysts to try something new.[174] Such frustration occurs more often among experienced analysts. Years of attempting to make sense of overwhelming masses of information with inadequate analytic paradigms and technologies leaves some experienced analysts willing to grasp at anything that will improve how they work. On the other hand, newly hired analysts who have not yet experienced the frustration of inadequate paradigms for analysis may be resistant to adopting rigorous analytic paradigms such as that afforded by critical thinking.[175]

Transforming Intelligence Corporations

In order for an institution to change, all affected personnel, from the lowest to the highest, must first recognize that change is needed and is advantageous – both corporately and personally. As retired World Bank executive Stephen Denning argues, this is difficult to accomplish. Logically sound arguments do not sway employees. Instead, employees remain convinced that what they are doing is satisfactory.[176] Further, outsiders who attempt to induce change face opposition because employees presume that external consultants are arrogant in suggesting that things are not right, and that change is needed.

One way to effect change is through a "springboard story." This approach contrasts with past conventional – and largely unsuccessful – transformation efforts that relied on fixing the systems involved and were characterized by an overabundance of buzzwords:

> Enhance quality. Streamline procedures. Reform and flatten the organizational structure. Analyze things in terms of grids and charts. Develop plans in which individuals are programmed to operate like so many obedient computers. Hone our interpersonal mechanics and build skill inventories. Bring to our difficulties a fix-it attitude, as though our past errors can be easily corrected with straightforward explanations.[177]

---

176 For a discussion of Denning's philosophy about change, see Jeff de Cagna, "Making Change Happen: Steve Denning Tells the Story of Storytelling," Information Outlook, January 2001, 28–35, and Stephen Denning, *The Springboard: How Storytelling Ignites Action in Knowledge-Era Organizations* (Boston, MA: Butterworth-Heinemann, 2001). Cited hereafter as Denning, Springboard.

177 Denning, *Springboard,* xvii. In 23 years of Intelligence Community work, the author heard all of these phrases as slogans for various programs designed to "fix" analysis or the corporations involved. These associated corporate efforts to bring these goals about often had the opposite effect. In the process of "flattening

As Denning points out, these strategies fail to account for the messy and chaotic reality in which real organizations live and work, especially intelligence agencies which have the charter to engage honestly with "the other," or mission-related targets, outside of the bureaucracy in which they serve.[178]

The springboard story helps employees at all levels envision what is needed for the proposed transformation. Denning asserts that it "invites them to see analogies from their own backgrounds, their own contexts, their own fields of expertise."[179] He cautions that transformational stories are not a panacea – there are situations and circumstances in which they are not effective, such as when the change being proposed is a bad idea.[180] The key is finding the appropriate stories within the corporate culture.

One way to find these stories is to examine the best practices of intelligence analysis successes where critical thinking played a role. Just recounting a success is not enough. Listeners need to be able to identify and empathize with the scenario and its actors. The effective story is "about people who have lived [a] knowledge-sharing idea and how things happen in a real-life situation."[181] For example, conducting a trial or experiment on critical thinking within the intelligence analysis process, if it leads to certifiable, actionable success, *does* effectively persuade.

Learning from Early Adopters

Once a sustained number of early adopters openly apply systematic, critical thinking to hard analytic problems, the stage is set for a "tipping point" in the spread of structured methods across

---

the organization" at one intelligence agency, more hierarchical managerial layers were actually created!

178 Denning, *Springboard,* xvii.

179 Denning, *Springboard,* xix.

180 Denning, *Springboard,* xxi.

181 Denning, *Springboard,* 51.

analytic populations.[182] Stanley Feder recounts how a tipping point began to apply to a political analysis method at the CIA in the 1970s and 1980s. The method involved two estimative tools known as Factions and Policon that were used by the "Intelligence Directorate and the National Intelligence Council's Analysis Group to analyze scores of policy and instability issues in over 30 countries."[183] The reasons for the adoption of these tools remain the same: "Forecasts and analyses…have proved to be significantly more precise and detailed than traditional analyses."[184] Writing about the method in 1987, Feder predicted that its use would continue to expand.[185] The method is still in use 19 years after Feder's article was published. However, expanded use failed – perhaps because the tool was on a computer platform that ceased to be supported by the Agency. The recent transfer of the tool to a new suite of programs corresponds with observations that its use is once again expanding.[186]

Non-intelligence-related transformational stories can be applied in the Intelligence Community to facilitate the spread of new ways

182 Malcolm Gladwell, *The Tipping Point: How Little Things Can Make a Big Difference* (Boston, MA: Little Brown and Company, 2000), 15–29. Gladwell shows how "social epidemics" can infect a variety of domains.

183 Stanley Feder, "Factions and Policon: New Ways to Analyze Politics," in H. Bradford Westerfield, ed., *Inside CIA's Private World: Declassified Articles from the Agency's Internal Journal, 1955–1992* (New Haven, CT: Yale University Press, 1995), 275. Cited hereafter as Feder, "Factions and Policon."

184 Feder, "Factions and Policon," 292.

185 Feder, "Factions and Policon," 292. Feder was wrong about its sustained popular growth.

186 This story is not an isolated instance. In the author's experience, initial implementation and popularization are often followed by a gradually reduced user-base. Certain organizations find the tools useful and they tend to continue to use them even though any underlying technology may be obsolete. In the case of Factions and Policon, the tools were maintained on an aged Macintosh computer. They were updated in 2006 as part of the work of an intelligence research firm in New Mexico. The Factions tool was rewritten and included in Landscape Decision®, a suite of modeling and simulation tools developed under a research contract with the Department of Defense's Advanced Research and Development Activity (ARDA). The updated technology was reinserted into the tasking organization. Other technology transfers are pending.

of thinking. For example, two video commercial advertisements from the Electronic Data System (EDS) company resonate with the challenge of rebuilding intelligence analysis in the face of skeptics, and what it takes to be an intelligence analyst.[187] The two related commercials depict farcical situations based on two well-known clichés: "You've got to build it before you can fly it!" and "It's like herding cats; it can't be done!" In the former, a group of mechanics is building an airplane in mid-flight; while in the other, a group of cowboys has accomplished the impossible – they are herding cats across the Great Plains. EDS' depiction of its revolutionary design capabilities bears a message about corporate rebuilding and individual transformation. The message encourages managers and analysts to compare themselves and their situation to the people tasked with building an airplane at "60,000 feet," or with herding cats across a river.

Intelligence analysts and managers who have seen the videos have had little trouble drawing analogies with the corporate and personal transformations needed in the Intelligence Community. That the situations are humorous only adds to a viewer's buy-in – they are "hooked" before they realize it. Developing other stories that specifically apply to corporate transformation within the Intelligence Community and its various elements is a logical next step in encouraging analysts and managers to use and support critical thinking in analysis. If these stories can be drawn from recent analytic successes, their value can only increase.

The Costs and Benefits of Thinking Critically

Are intelligence failures inevitable if analysts lack critical thinking skills? Yes. However, critical thinking is not a panacea. Intelligence failures still can be expected. If no measure "will guarantee that accurate conclusions will be drawn from the incomplete and ambiguous information that intelligence analysts

187 See *Building Airplanes in Flight*, television advertisement produced for EDS by Fallon-McElligott, November 2000, videocassette; and *Herding Cats,* television advertisement produced for EDS by Fallon-McElligott, January 2000, videocassette.

typically work with…[and] occasional failures must be expected," why should the Intelligence Community invest in teaching its analytic workforce to think critically?[188] A brief review of the causes of failure clarifies the need for such an investment.

Intelligence failures occur in both systematic and functional domains. Systematic intelligence failures occur when producers fail to notice phenomena and the consumers of intelligence fail to heed warnings or even to notice that they are being warned. It may be that both consumers and producers are focused on other issues at the time. Alternatively, intelligence-based warning is not taken seriously at high official levels. In cases where collaboration among intelligence agencies might be critical, key evidence may not be recognized and shared.

All of these failings are illustrated in the "intelligence failure" to warn of the attacks of 11 September 2001 on the World Trade Center in New York and the Pentagon near Washington, DC. In the first place, the policy issue that was at the forefront – according to press at the time – was a national missile defense system, not the likelihood of a terrorist attack on the United States. Richard Clarke, the Clinton and then Bush administrations' terrorism "czar" observes that Bush administration officials were slow to recognize or consider the threats posed by Osama bin Laden.[189] Evidence passed by an FBI field agent about students learning to fly large aircraft with little regard for landing or takeoffs was not taken seriously at higher levels within the Bureau.[190] The Joint Congressional investigation into the attacks noted in its report that collaboration was lacking between agencies, especially between the law enforcement and strategic

intelligence agencies.[191] This was both a cultural and a physical phenomenon. Airport security breaches during the summer of 2001 may have been related, but based on assessments of the catastrophe, were not connected to the events.[192]

The same kinds of failings were identified by the Senate Select Committee on Intelligence in its assessment of the National Intelligence Estimate on Iraqi WMD. As has already been observed, analysts and their managers were focused on the results and not the process.[193]

Critical thinking can mitigate some common causes of failure and provide means by which they can be avoided in the future. Specifically, an intelligence process based on critical thinking offsets the following failures:

Analysts are Wrong. It is unrealistic to expect that analysts can always be correct. Regardless of the processes they employ, analysts make errors and fail. Anthropologist Rob Johnston defines *errors* as "factual inaccuracies in analysis resulting from poor or missing data." Conversely, intelligence *failures* are "systemic organizational surprise resulting from incorrect, missing, discarded, or inadequate hypotheses."[194] Critical thinking mitigates these by providing means to assess errors in reasoning as they occur and before they become

191 U.S. Congress, *Joint Inquiry into Intelligence Community Activities Before and After the Terrorist Attacks of September 11, 2001,* Report of the U.S. Senate Select Committee on Intelligence and U.S. House Permanent Select Committee On Intelligence, Together with Additional Views, Senate Report No. 107–351/House Report. No. 107–792, 107th Congress, 2nd Session, December 2002, xvi.

192 The author recalls that media reports of persons hopping over or otherwise improperly passing airport security checkpoints in and around Boston, New York, and Washington seemed to be higher than usual during the summer of 2001.

193 DNI Negroponte, in the *National Intelligence Strategy of the United States* (October 2005, 2) highlights the notion that the Community appropriately undertakes study of its internal processes, as well as of the quality of its products, by addressing both "enterprise" objectives as well as "mission" objectives.

194 Johnston, *Analytic Culture,* 6.

systemic failures. Such a meta-cognitive approach to the analytic process helps keep it under active review at the highest levels.

Policymakers Ignore Intelligence.[195] A critically thinking analytic population cannot directly affect what a policymaker can or will do – neither in fact, can a *non-critically thinking* analytic population. What critically thinking analysts can do, however, is present more effective assessments, perhaps leading policymakers to question their own assumptions on the issues. Additionally, thinking critically about how analysts interact with policymakers can identify ways to restructure the analysis dissemination process to involve policymakers more effectively. Such a process might also encourage them to adopt some of the attributes of critical thinking leading to (it may be presumed) more effective policy.[196]

Adversary Denies and Deceives. Critical thinking reduces the effects of adversarial denial and deception by leading analysts to consider alternative possibilities, to question biases and assumptions, to examine systematically the validity of evidence being considered, and to take seriously anomalies in the evidence.

Adversary is More Capable. In any adversarial system, there are winners and there are losers. While analysts can do everything possible to ensure their work is correct, they rarely work with all the evidence, and indeed may still be deceived. In such cases, they may come to wrong conclusions. Critical

---

195 There is a "classic" argument as to whether this is or is not an "intelligence" failure. In summary, the two sides condense as follows: On the one hand, intelligence should have been so persuasively presented as to compel the policymaker to pay attention. On the other hand, intelligence should not be telling the policymaker what to do. The argument goes all the way to the roots of the post-World War II strategic intelligence system currently in place. Former CIA analyst Jack Davis summarizes the issue in "The Kent-Kendall Debate of 1949," *Studies in Intelligence* 35, no. 2 (Summer 1991): 37–50.

196 Cooper, email to the author, 31 March 2006. Cited hereafter as Cooper, email, 31 March 2006.

> thinking, however, by providing structure and oversight to their reasoning, provides an audit trail. In this case, the means by which the analytic conclusions were reached can be subsequently reviewed, errors and deceptions revealed, and steps taken to improve the process so that the failure is not repeated**.** Indeed, because of its focus on the process, critical thinking becomes a powerful tool for evaluating and enhancing analytical reasoning.

Investment in critical thinking as part of the analysis process minimizes the likelihood of specific failures. With critical thinking essential to so many parts of the intelligence production process, enhancing it increases the likelihood of intelligence success.[197] With the cost of failure catastrophically high, the Intelligence Community is well advised to improve the likelihood of intelligence success, including improving critical thinking. As diplomat Richard Holbrooke opined in 2003, "intelligence is…indispensable. And its greatest successes are preventative."[198]

There are other reasons why systemic intelligence failures occur. Jeffrey Cooper considers ten pathologies, summarized in table 6, that impede successful analysis at both the individual and corporate levels. Cooper specifically believes that given the

> [emphasis] on the systemic nature of the pathologies that afflict intelligence analysis, structured analytic methods

---

197 One metric for intelligence is decreasing intelligence failures. In this case, fewer failures could be considered as "improving intelligence." But the reasons for the prevention of the failures need to be considered. The reduced number of failures could be due to a critically thinking workforce. Or it could be due to coincidences. Although a pointed discussion of metrics for intelligence is beyond the scope of this paper, recent articles explore the issue of intelligence metrics. See, for example, David T. Moore, Lisa Krizan, and Elizabeth J. Moore, "Evaluating Intelligence: A Competency-Based Model," *International Journal of Intelligence and Counterintelligence* 18, no. 2 (Summer 2005): 204–220.

198 Richard Holbrooke, in Judith Miller, "A Battle of Words Over War Intelligence," *New York Times,* online edition, 22 November 2003, URL: <www.nytimes.com/2003/11/22/arts/22INTE.html>, last accessed November 28, 2003.

Cooper's Analytic Pathology	Description
Inefficient "Account" Structure	Work is subdivided into accounts with ownership; provides basis for accountability; ownership inhibits sharing, cooperation, and collaboration; encourages "stovepiping" in collection disciplines.
Evidence-Based Scientism	Descriptive and explanatory intelligence support current policy and military operations; less support for anticipatory intelligence; analysis needs to be "augmented and leavened with intuition, curiosity, and a thirst for discovery – all essential elements of good science."
Tyranny of Current Intelligence	Response to customers' current concerns; support to current, ongoing military operations; little long-term research.
Over-Emphasis on Production	Databases need filling; scheduled reports and assessments must be produced on time; metrics for success measure data collected and processed; number of reports issued used to determine and justify resources allocated.
Over-Reliance on Previous Judgments	Previous reports presumed to be authoritative; previous reports combined to form new judgments; agreed-upon positions retained despite newer contradictory evidence.

Table 6: Cooper's Analytic Pathologies

Source: Summarized from Cooper, *Pathologies*, 30–39.

> become a first line of defense in preventing the networks of errors from developing – they are like "ripstops" that keep problems from propagating into wider "error-inducing systems," in [Charles] Perrow's terms.[199]

199 Jeffrey Cooper, email to the author, 31 March 2006. Cooper refers to Charles Perrow, *Normal Accidents: Living with High-Risk Technologies* (Princeton, NJ: Princeton University Press, 1999).

Cooper's Analytic Pathology	Description
Neglect of Research	Short–term taskings prevent longer–term research; reward structure favors current reporting, not longer term work; stunts development of deep target expertise.
Neglect of Anticipatory Intelligence	"Information Revolution" leaves intelligence competing with journalism and Internet for policymakers' attention; lack of predictive intelligence against new emerging threats ensures continuing failures to warn.
Loss of "Keystone Species" and "Intellectual Middleware"	Periodic reductions in force skew analyst demographics; "Keystone Species" (journeymen analysts) lacking; journeymen do bulk of professional maintenance; essential for knowledge retention and transfer to apprentices; maintain "intellectual Middleware" or deep understanding of analytic domains and processes.
Lack of Analytic Tools and Methods of Validation	Available and proposed tools not formally validated for accuracy and usefulness; focus on results, not processes, to determine success.
Hindrances of Security Mindset	Security procedures impede multi–source analysis; protection of sources and methods more important than "effective exploitation and cross–fertilization;" artificial and outdated mission distinctions prevent collaboration.

Critical thinking combats this by enhancing the processes by which decisions are made and by which such processes are reviewed. This paper focuses primarily on *individual experience*, and of course, intelligence corporations are made up of individuals. If a sufficient number of intelligence professionals are thinking critically, it is likely they will transform their corporations, if only through the sheer attrition of non-critically thinking managers and leaders who are

retiring from the work force. It should be observed that an Intelligence Community enterprise-wide emphasis on developing critical thinking skills at all levels would speed the process.

Validation

A critically thinking Intelligence Community remains essential for effective intelligence reform. Steven Rieber and Neil Thomason advance this argument in their recent article. The authors assert that "the opinions of experts regarding which methods [of analysis] work may be misleading or seriously wrong."[200] Unfortunately, as the authors show, past (and present) efforts at intelligence reform rely on expert intuitive judgments. However, "[examples] from a wide range of fields show that expert opinion about which methods work are often [not only] dead wrong…but also are generally not self-correcting."[201] Further support of Rieber's thesis is seen in devil's advocacy – not as theoretically applicable but as practiced. They cite Irving Janis who, quoting a Stanford political scientist, notes that "instead of stirring up much-needed turbulence among the members of a policymaking group, [devil's advocacy] may create 'the comforting feeling that they have considered all sides of the issue.'"[202]

To mitigate this and similar analysis-improvement fallacies, Rieber and Thomason argue that improvements in analysis and any proposed methods of judgment and decision-making require validation through scientific study. They note, for example, that research reveals "[a] certain cognitive style, marked by an open-mindedness and skepticism toward grand theories, is associated with

---

substantially better judgments about international affairs."[203] As the present paper has argued, such attitudes are found in critical thinkers. Scientific study of this and other methods will determine when and how they are appropriate. Critical thinking also supports Rieber and Thomason's call for a "National Institute for Analytic Methods" by providing an overarching structure to champion open-mindedness and skepticism in the study of which methods are appropriate for intelligence analysis. Only then, they argue, will real intelligence reform and improvement occur.

Rieber and Thomason's proposed institute could determine which strategies are most effective at disposing analysts and their corporations to employ critical thinking. Research evidence indicates that simply teaching critical thinking (or for that matter, structured analytic) skills is insufficient. People will not adopt the strategies unless motivated to do so. As noted here, springboard stories are one means of implanting a positive disposition toward critical thinking. Other means certainly also exist. A desirable objective of research in the proposed National Institute for Analytic Methods would be to discover and assess what might motivate analysts most effectively toward thinking critically.

203 Rieber and Thomason, "Creation of a National Institute for Analytic Methods," 74.

What Other Points of View Exist?

A recent best-selling book advances the comfortable idea that conscious reasoning may not confer advantage to the reasoner.[204] Recent research suggests that whereas simple choices may benefit from conscious thought, complex issues are best left to unconscious thought, or "deliberation-without-attention."[205] The explanation of this finding is that in conscious thinking, people face a severe limit on the number of factors that they can effectively consider simultaneously and, second, that in conscious thought people "inflate the importance of some attributes at the expense of others."[206] The authors base this finding on four experiments with subjects who were asked to indicate their preference for various consumer items. The experiments involved differing levels of complexity in terms of factors to be taken into consideration. They ultimately suggest that:

> [there] is no *a priori* reason to assume that the deliberation-without-attention effect does not generalize to other types of choices – political, managerial or otherwise. In such cases, it should benefit the individual to think consciously about simple matters and to delegate thinking about more complex matters to the unconscious.[207]

It appears true that the human capacity to weigh evidence *consciously* is limited to approximately seven factors.[208] But this seven-

---

204 Malcolm Gladwell, *Blink: The Power of Thinking Without Thinking* (New York, NY: Little Brown and Company, 2005). Gladwell argues that thinking does not require detailed assessment of information. Instead, rapid cognitive responses are adequate for decisionmaking.

item limit is easily extended: people can hierarchically consider multiple sets of seven items.[209] Employing structured methods of reasoning also extends this capacity. In this context, critical thinking is at once both a structuring method and a means of assessing and monitoring the processes of selecting and using other structured methods. Additionally, "deliberation-without-attention" as applied to consumer choices in the study noted above was measuring *preferences.* Preferences change from person to person – different people conclude differently about oven mitts and cars – as the variety of these products on the market, in kitchens, or on the roads makes clear.[210]

Intelligence analysis is not about preferences; it is about best answers in ambiguous situations with high-stakes implications and consequences. As recent intelligence failures make clear, without forced consideration of alternatives, results are biased. Structured reasoning methods such as Analysis of Competing Hypotheses (ACH) develop these alternatives, allow for multiple factors to be considered fairly, and extend analyst capacities to assess complex situations as accurately as possible.

Intuition is what both Dijksterhuis and Gladwell consider in their respective works. However, exactly *what is intuition?* Rather than just appearing from nowhere, intuition is "almost always informed by experience and hard knowledge won by reasoning things out."[211] As Michael LeGault notes,

> good decisions [are] a nuanced and interwoven mental process involving bits of emotion, observation, intuition, and critical thinking....The essential background to all this is a solid base of knowledge...The broader the base, the more likely all the parts will fit together.[212]

210 Oven mitts and cars are two of the categories for which Dijksterhuis and his colleagues tested.

211 LeGault, *Think*, 12.

212 LeGault, *Think*, 12.

Uninformed "intuitive thinking" contributes to intelligence failures because it fails to reflect on presuppositions. Such unexamined biases and mindsets contributed to the Cuban missile intelligence failure described above. Heuer's outline of the specific biases and mindsets that impede effective analysis is reinforced by the findings of others.[213] For example, Merom, writing about the Cuban crisis, concludes that intelligence failures occur due to a "lack of commitment to fundamental principles of investigation and analysis."[214] Although intuition or "thin slicing" may be appropriate in some domains, in intelligence analysis it appears to be associated with cognitive impediments that cause costly intelligence failures.[215]

However, as Rieber and Thomason note, testing needs to be conducted to determine which methods do work best in which situations in intelligence analysis.[216] Their work ought to go further, developing and modifying methods to overcome the very limitations they identify. For example, investigators have found that ACH suffers from confirmation bias.[217] The present author notes that this may be because non-confirmatory reasoning is so difficult for people to do.[218]

---

213 See for example, Scott Plous, *The Psychology of Judgment and Decision-making* (New York, NY: McGraw Hill, Inc., 1993); Thomas Gilovich, Dale Griffin, and Daniel Kahneman, Eds. *Heuristics and Biases: The Psychology of Intuitive Judgment* (Cambridge, UK: Cambridge University Press, 2002); and Daniel Kahneman, Paul Slovic, and Amos Tversky, eds. *Judgment under Uncertainty: Heuristics and Biases* (Cambridge, UK: Cambridge University Press, 1982).

218 The author teaches Analysis of Competing Hypotheses to both new and experienced analysts at the National Security Agency. He notes that holding a non-confirmatory attitude – which ACH, as developed by Heuer, requires – is

Finally, it may be a fallacy that conscious and unconscious reasoning are truly separate. Instead, Morgan Jones (citing work by Richard Restak) asserts that "the unconscious has a governing role in much that we consciously think and do."[219] This means that analysts commit a variety of "analytic sins," including focusing on the initially favored solution – which is also often the first satisfactory solution considered.[220] Part of the problem seems to arise from confusion about "'discussing/thinking hard' about a problem and 'analyzing' it, when the two activities are not at all the same."[221] Ultimately, the unconscious or instinctive approach to reasoning seems to "remain closed to alternatives."[222] This is an unsatisfactory model for intelligence analysis where alternatives *must* be considered.

---

extremely difficult for people to do. Since the method has value, a means of mitigating this difficulty is worth developing.

What Does the Future Hold?

Looking ahead, new paradigms for analysis become necessary in light of the many changes occurring across the globe. Rapidly emerging twenty-first century issues and challenges stress both infrastructures and sensemaking enterprises. The changes needed to maintain an edge against adversaries becomes clear as one considers what it is that analysts do, and how and when, as table 7 illustrates.

Gregory Treverton's observations about the evolution of intelligence sensemaking and the organizations that comprise the national intelligence enterprise suggest that current "reform" efforts are merely the first steps in a much lager – and fundamental – transformation. A careful, considered examination of what intelligence must accomplish and how this can be best achieved may ensure that the goals Treverton identifies as necessary for the future are met – and met sooner rather than later. Here again critical thinking has much to offer. By encouraging discussion of the alternatives and their advantages and disadvantages, and by examining analogous cases, critical thinkers aid the transformation. Questioning of assumptions about the roles of intelligence, its activity, and organization will reveal which long-held beliefs need retirement.

Further, technology efforts in support of analysis, such as those being developed through the efforts of the ARDA – and other – advanced technology efforts presume that analysts think critically. For instance, by focusing "analytic attention on the most critical information found within massive data,"[223] some research projects seek to uncover otherwise unknown information that indicates the potential for strategic surprise.[224] These projects seek to build

223 Critical information is that which is *essential* for analysts to make sense of what their targets are going to do. Often it is buried in massive amounts of "noise."

224 Advanced Research and Development Activity, *Broad Agency Announcement for the Novel Intelligence from Massive Data (NIMD) R&D Program,* NMA401–02–BAA–0004, 7 JUNE 2002, 1.

partnerships between analysts and technology applications.[225] In one case, a research firm has developed technology that enables analysts to generate and validate novel hypotheses, distill complex systems into digestible elements, create effective narratives, and inspire creative thinking.[226] Other examples are illustrated in the adjacent text box. Follow-on research efforts such as the Collaboration and Analyst/System Effectiveness (CASE) effort will develop these efforts further.[227] The intelligence workforce these ARDA-supported efforts presuppose is being hired and trained now.

The future also holds opportunities for further developing models of reasoning in intelligence. Exactly how analogy and critical thinking interact, the roles of creative thinking, the roles of intuition, and specific strategies for bias mitigation are all areas warranting further research. Formal validation of how critical thinking improves intelligence reasoning is another research topic. Rieber and Thomason's proposed National Institute of Analytic Methods is an obvious venue for such research. Additionally, the ARDA advanced questioning and answering research program, AQUAINT, as well as other ARDA programs dealing with predictive analysis, prior and tacit knowledge, and hypothesis generation offer other domains in which such research could occur.[228] Such research is of both intrinsic value and necessary for developing new means

225 The five areas on which the NIMD effort focused were modeling analysts and how they work; analysts' prior and tacit knowledge; creating, representing, and tracking multiple scenarios, hypotheses, and/or strategies; massive data management and analysis; and the means by which analysts interact with technology. The author represented his agency in evaluating and mentoring the efforts of the researchers.

226 The author is a technical mentor of this firm's work.

Issue	1970s and 1980s
Focus of Analysis	Continuing large, well-defined issues and adversaries
	Space for longer-term thinking
Organization and Workflow	Large, centrally organized and managed
	Hierarchical
	Institutional and operational memory mostly in analysts heads
	Time pressure persistent but low intensity (mostly)
Sources and Methods	Dominated by secret sources
	Analysts are separated from collectors
	Analysts mostly passive recipients of information
	Analysis focuses on previous patterns
	Analysts operate on basis of own experience and biases
Analysts' Characteristics	Many analysts are deep specialists
	Analysts mostly work alone or in small groups
	Key analytic choices with analysts

Table 7: Analysis: Past, Present and Future

Source: Developed by Gregory F. Treverton with input from the author.

1990s and 2000s	Future
Emergence of complex, rapidly shifting issues and adversaries	Complex, rapidly shifting issues and adversaries and large, well-defined issues and adversaries
Bias toward current intelligence	Both immediate question–answering and deeper analysis
Large, centrally organized and managed	Tailored to rapidly adapt to shifting foci
Still hierarchical, though problem-oriented "centers" added	Flat, problem-centric networks
Institutional and operational memory mostly in analysts heads	Technology helps to notice what analysts are watching and asking
Time pressure drives toward premature closure	Technology allows memory even of hypotheses, data rejected by analysts
Broader range of sources, but secrets still primary	Draws on a wide variety of sources, open and secret
Analysts are also their own collectors	Analysts are their own collectors
Limited searching of available data	Much more aggressive searching and reaching for data…both classified and unclassified
Same, though growing interest in new methods and tools for shaping, remembering, and examining hypotheses	Formative pattern recognition and data mining capabilities searches for out of the ordinary
Limited use of formal method and technology	Wide use of method and technology – from aggregating expert views to searching, data mining, pattern recognition
Many, perhaps most, analysts are generalists	Mix of generalists and deep specialists, both technical and political
Analysts mostly work alone or in small groups	Analysts work in larger virtual networks
Key analytic choices with analysts	Key analytic choices with analysts

Email exchanges 17–18 May 2006.

of improving intelligence analysis. Knowing the details of how analysts reason and how they might reason more effectively guides managers to understand where educational and training efforts can be most valuable.

TECHNOLOGICAL ADVANCES IN CRITICAL THINKING

One ARDA research team has created a technological system employing an automated critical thinking-based model that provides an overarching control structure for analytic reasoning. It includes both model generation (for counter–examples) and more traditional argument building. The system's creators assert – based on preliminary testing – that analysts employing the system are faster and more accurate problem solvers.

Suppose an analyst develops an argument in the course of using this system, that confirms that Saddam Hussein has WMD and an argument that confirms that Saddam does not have WMD. Working both sides of this issue, this analyst will make inferences from evidence and link them with other evidence-derived inferences. She will not imagine a situation in which all her evidence is true, but her hypothesis is not. For example, the evidence might include communications from which she infers that those communicating – including Saddam's scientists – believe they have WMD. Using the system, she also would be led to consider that the scientists might have wanted to deceive Saddam into believing that they were further along than they were. The generation of this alternative model can only arise through a mechanism that conducts the analyst away from the comfortable, inductive, confirmation path associated with the initial hypothesis.

Conclusion

> Never before in our peacetime history have the stakes of foreign policy been higher.
>
> —Sherman Kent, 1949

This paper posed the intriguing question: "How can intelligence analysts be 'really good'"? Critical thinking, if conceived and employed by intelligence analysts as suggested here, appears capable of leading analysts to adopt personal habits of thought appropriate to the resolution of hard intelligence problems. The idea that intelligence analysts are expected to bring to the table a capability to draw reasoned and actionable conclusions from scant and conflicting information distinguishes their charge from that of their academic brethren. Thus, intelligence analysts in government or other applied work environments may deserve the lavish budgets and technological capabilities they often enjoy.

To earn their high level of resource support, analysts can take advantage of a capability to redirect unique intelligence collection capabilities. In doing so, they are perfectly positioned to apply critical thinking methods to the hard problems. They can, for example, order up special collection against targets that exhibit even fleeting evidence that convincingly disconfirms one or more alternative hypotheses about an impending threat. This is the nub of Ben-Israel's argument for a "logical" approach to intelligence analysis for national security, and is an approach no doubt under-used by those who do not systematically think about threats in the manner developed in this paper.

Although most of the specific threats have changed since Sherman Kent first wrote in 1949, his epigraph remains as true today as it was then: the survival and prosperity of the United States remain at stake; they depend on effective, informed foreign policy.[229] Critical thinking brings with it an indispensable capability to inform a rational

229 Kent, *Strategic Intelligence,* ix.

foreign policy. "Really good analysts" are those who think critically about the issues they work and the problems they solve; they bring structured thought to the foreign policy realm.

Appendix

NSA's Critical Thinking and Structured Analysis Class Syllabus[230]

Background

Twenty-first Century intelligence issues involve uncertainty, mysteries, and risk. This differs from the 20th Century paradigms of security, secrets, and prevention. Analysis of current complex issues requires of its practitioners novel approaches including a productively imaginative process of inquiry. Questions an analyst asks not only serve as devices for attracting existing evidence, but also as devices for generating new evidence not presently considered. In this way, analysts more thoroughly examine complex issues and, aided by technology, are more likely to create novel intelligence and prevent strategic surprise.

However, such reasoning is at odds with how people – all people, including intelligence analysts – naturally think. Instead, people seek to confirm the first answer to a problem they discover, selectively using evidence to support that position *even when there is compelling evidence that an alternative hypothesis may actually be the correct one.* That people routinely fall prey to such poor thinking is well documented. Indeed, most commercial advertisers strive to take advantage of this. So do adversaries. One element of most intelligence failures includes poor thinking on the part of analysts—poor thinking of which adversaries have taken advantage. So how can analysts avoid such thinking?

One solution is to teach intelligence analysts to think critically.

230 This syllabus has been developed and refined by the author through several years of teaching critical thinking at the National Security Agency's National Cryptologic School. An early version of the course bore similarity to one developed by (then) MSGT Robert D. Folker, while a student at the (now) National Defense Intelligence College. Folker's course focused on the methods of analysis, not on the overarching critical thinking. His course (as written) is not taught at the college.

Critical thinking provides structure to the reasoning process that identifies for analysts where they are likely to go astray. It offers a means for self-reflective reasoning that leads to improved thinking. If such thinking is aided by structured analytic techniques, then analysts will (and do) improve how they resolve issues with which they are confronted. The quality of their work improves.

This critical thinking and analytic problem-solving course offers participants a chance to learn a paradigm for critical thinking and critically explore 14 different structured methods of analysis. Texts by critical thinking experts Richard Paul and Linda Elder, and structured analysis experts Morgan Jones and Richards Heuer, as well as materials developed by the instructor, teach the concepts and techniques. Classroom problems as well as operational examples (introduced and developed by the students from their own work) reinforce and help transfer what is learned into the operational environment. A final project developed by student teams completes the formal requirements.

Learning to think critically and to solve problems in a structured manner requires active participation. The class requires 40 hours of classroom time, consisting of ten sessions of four hours each. The method of instruction is Socratic, demanding active classroom participation. Participants also can expect homework, requiring both office and non-office time. Participants will prepare reading summaries for each class session, and develop one (or more) operational examples of at least one structured analytic method. Finally, participants work together on teams to complete classroom assignments and a final project dealing with an operational issue (employing at least five structured analytic methods).

Administration:

Enrollment: Up to 21 Students.
Class Date/Time/Duration: One 4-hour class per day for 10 weeks.
Class Location: _____.
Homework: Yes, but hopefully not too odious. Operational examples are required. A team project is due at the end of the course.

Texts:

Elder, Linda, and Richard Paul. *The Foundations of Analytic Thinking: How to Take Thinking Apart and What to Look for When You Do* (Dillon Beach, CA: Foundation for Critical Thinking, 2003).

Jones, Morgan D. *The Thinker's Toolkit: Fourteen Skills for Making Smarter Decisions* in B*usiness and in Life* (New York, NY: Crown Publishing Group, 1997).

Several handouts (TBD)

Objectives:

The overall objective of the class is to enable you to critically think about analysis and what analysts are tasked to analyze. A second objective is to provide you with a set of analytic tools that are useful to your analysis. At the end of the class you will be equipped with a set of analytic skills and will have honed your critical thinking skills, allowing you to better function in the workplace. Specifically, the course objectives are as follows:

Upon completion of this course you will be able to:

- Use critical thinking techniques to provide structure to your analytic reasoning.
- Identify, describe, and employ 14 methods for structured reasoning.
- Demonstrate critical thinking proficiency through lecture, classroom participation, and weekly homework assignments.
- Complete a final class assignment using a minimum of five structured analytic methods presented in this course.
- Apply knowledge of critical thinking by using a set of analytic tools designed to hone your skills as an analyst.

In other words, at the end of this 10-week-long class, you will have

- Learned to critically analyze intelligence-associated data, information, and evidence.
- Honed your critical thinking skills.
- Built a "toolbox" of analytic and problem-solving methods.
- Become better analysts.

For example, when you approach a problem you will be able to

- Discover the true problem by restating and considering alternative outcomes.
- Have a variety of methods by which you can organize and make sense of the relevant evidence.

Formal Requirements:

Written summaries of readings. (No more than one page per chapter assigned.) The summaries should answer ***exactly*** the questions on page five of the syllabus. The summaries should also include answers to the exercises in Morgan Jones' book. The summaries will be typed unless prior arrangements have been made with the instructor. In-class discussions will draw heavily on the readings.

Problems from the work environment (Operational Exemplars). As we study the elements of reasoning and the methods of problem solving, we need operational examples

against which to apply/illustrate what we are learning. You will be responsible for providing at least one of those examples for the class to be presented during the week we discuss the method. The best exemplars may be saved for use in subsequent classes.

Final project. Working in teams of three or four, and using any Problem Restatement and Divergent and Convergent Thinking plus at least three other methods developed in the course – for a total of of at least five methods – you will develop an operational project to be presented at the last class. You will apply the elements of critical thinking to the method chosen as well as the specific problem, apply the appropriate methods to solve of problem, report the results, and evaluate the process. The project will be presented during a 15–20 minute briefing. A list of the specific elements that must be included and the format by which the project is graded is on the last page of this syllabus.

Grading:

- **Written Summaries (25%).** Due weekly. The first summary will be graded. Subsequently, a random number generator will be used to select three (3) additional summaries for grading. Grading will be based on the "Universal Intellectual Standards" in *The Foundations of Analytic Thinking* and on whether instructions are followed. For example, if you are asked to identify what key questions an author is attempting to answer, *it is expected that you will provide those questions in the reading summary.*
- **Class Participation (25%).** Since this is a discussion course, you are expected to engage in the process.
- **Operational Exemplars (25%).** Assigned the first week. No longer than 5 minutes each.
- **Final Project (25%).**

Class Descriptions and Weekly Assignments (complete prior to each class):

Class 1 – How We Don't Think and How We Might

Reading Assignment: *The Thinker's Toolkit: Fourteen Skills for Making Smarter Decisions in Business and in Life*, Chapters 1–2 (Part One).
Psychology of Intelligence Analysis, 1–30.
Critical Thinking: Concepts and Tools, entire work.

Written Assignment: *Reading summaries for chapters from Jones and Heuer. Exercises in text.*

Class Objectives: *At the end of Class 1 you will be able to:*

- Define a bias and discuss the implications of biases in our decisions.
- Identify sources of cognitive biases.
- Describe the inherent dangers/benefits of biases and the difficulty of compensating for perceptual biases.
- Describe the characteristics and three principles of perception.
- Describe how analysts fall prey to absence-of-evidence biases.
- Describe how anchoring impacts analytical decision-making.
- Describe how a target can use assimilation biases to deceive.
- Acknowledge how analysts unwittingly use confirmation bias to support early assessments.
- Discuss how hindsight and reliability biases play a part in intelligence failures.
- Describe how oversensitivity to consistency bias can lead to undesirable results.
- Discuss how expert biases and the Pollyanna and Cassandra complexes distort our thinking.
- Describe how cultural, personal, and organizational

mindsets impact analysis.

- Define mindsets, discuss how they are derived, and describe how they influence predictions.
- Identify how we think.
- Describe critical thinking and the standards used for evaluating our thinking.
- Identify the elemental structures of thought.
- Describe the differences between inferences and assumptions in intelligence analysis.

Class 2 – Critical Problem Restatement and Alternative Thinking

Reading Assignment: *The Thinker's Toolkit: Fourteen Skills for Making Smarter Decisions in Business and in Life,* Chapters 3, 5.

Written Assignment*: Reading summaries for each chapter. Exercises in text.*

Class Objectives: *At the end of Class 2 you will be able to:*

- Demonstrate knowledge of the critical thinking process by providing an example that meets the universal intellectual standards.
- Describe the role of questioning in critical thinking.
- Identify the three types of questions used in critical thinking.
- Determine the sample domains involved in complex questions.
- Define problem restatement and apply its use through a practical example.
- Discuss the role that our biases play in problem restatement.
- Demonstrate knowledge of the critical thinking process by providing an example that meets the universal intellectual standards.
- Define divergent thinking and its benefits when performing a problem restatement.
- Discuss the pitfall involved in problem definition and how it relates to problem restatement.
- Describe some effective techniques for problem restatement.
- Identify the types of problems that benefit from problem restatement.
- Discuss how points of view influence the critical thinking process.
- Discuss the logic, benefits, risks, and elements of divergent thinking.
- Identify the four main ideas of divergent thinking.

- Describe what is needed to move from divergence to convergence.
- Identify the types of problems that benefit from divergent thinking.

Class 3 – Pollyanna, Cassandra, and Marshaling

Reading Assignment: *The Thinker's Toolkit: Fourteen Skills for Making Smarter Decisions in Business and in Life*, Chapters 4, 6.

Written Assignment*: Reading summaries for each chapter. Exercises in text.*

Class Objectives: *At the end of Class 3 you will be able to:*

- Discuss the pros-cons-fixes approach to critical thinking and the six-step method employed by successful analysts.
- Identify the logic behind the pros-cons-fixes approach and discuss those critical thinking problems best suited to this method.
- Apply the techniques of sorting, chronologies, and timelines to critical thinking and identify those critical thinking problems best suited for this approach.
- Identify the two-step technique used for sorted lists, chronologies, and timelines.

Class 4 – Causes, Squares, and Shrubs

Reading Assignment: *The Thinker's Toolkit: Fourteen Skills for Making Smarter Decisions in Business and in Life*, Chapters 7, 8, 9.

Written Assignment: *Reading summaries for each chapter. Exercises in text.*

Class Objectives: *At the end of Class 4 you will be able to:*

- Discuss the purpose, logic, underlying question, evidence, concepts, and types of problems best suited for causal flow diagramming.
- Identify the major factors and cause-and-effect relationships influencing causal flow diagramming.
- Characterize the differences between direct and inverse relationships and their impact on causal flow diagramming.
- Define a feedback loop and discuss what makes it stable or unstable.
- Apply your knowledge of causal diagramming by participating in a classroom exercise.
- Discuss the purpose, logic, underlying question, evidence, concepts, and types of problems best suited for scenario matrices and trees.
- Define and discuss the characteristics and differences between matrices and scenario trees.
- Apply your knowledge of scenario matrices by participating in a classroom exercise.
- Apply your knowledge of scenario trees by participating in a classroom exercise.

Class 5 – Weighing the Likelihood

Reading Assignment: *The Thinker's Toolkit: Fourteen Skills for Making Smarter Decisions in Business and in Life*, Chapters 10, 13.

Written Assignment: *Reading summaries for each chapter. Exercises in text.*

Class Objectives: *At the end of Class 5 you will be able to:*

- Discuss how individuals view issues.
- Discuss the purpose, logic, underlying question, evidence, concepts, and types of problems best suited for weighted ranking.
- List the 9-step process involved in weighted ranking.
- Demonstrate knowledge of weighted ranking through class and small group exercises.
- Discuss the purpose, logic, underlying question, evidence, concepts, and types of problems best suited for probability.
- Define and describe how and why we characterize and assign events, and how this influences intelligence analysis.
- Discuss and explain the differences between mutually exclusive and conditionally dependent events relative to probability.
- Identify the seven steps in creating a probability tree.
- Apply your knowledge of probability by participating in a classroom exercise.

Class 6 – Testing the Devil's and Other's Advocacy

Reading Assignment: *The Thinker's Toolkit: Fourteen Skills for Making Smarter Decisions in Business and in Life,* Chapters 11–12.
The Psychology of Intelligence Analysis, Chapter 8.

Written Assignment: *Reading summaries for each chapter. Exercises in text.*

Class Objectives: *At the end of Class 6 you will be able to:*

- Define intelligence.
- Discuss the purpose, logic, underlying question, evidence, concepts, and types of problems best suited for devil's advocacy.
- Define, describe, and characterize situations appropriate to employ methods of devil's advocacy in intelligence analysis
- Demonstrate prowess in devil's advocacy through participation in a practical case study.
- Discuss the purpose, logic, underlying question, evidence, concepts, and types of problems best suited for hypothesis testing.
- Discuss the benefits of hypothesis testing.
- Identify the 8-step process of hypothesis testing.
- Demonstrate prowess in hypothesis testing through participation in a practical case study.

Class 7 – Analyzing Apples and Toyotas

Reading Assignment*: The Thinker's Toolkit: Fourteen Skills for Making Smarter Decisions in Business and in Life*, Chapters 14, 15, 16.

Written Assignment: *Reading summaries for each chapter. Exercises in text.*

Class Objectives: *At the end of Class 7 you will be able to:*

- Describe how individual viewpoints influence utility analysis.
- Define utility analysis and discuss the type of problems best suited for this method.
- Identify the logic of utility analysis.
- Employ utility analysis to arrive at the most cost-effective solutions.
- List the steps involved in creating a utility tree and apply this knowledge by participating in classroom exercises.
- List the steps involved in creating a utility matrix and apply this knowledge by participating in classroom exercises.
- Examine the benefits of structuring as it applies to utility and probability analysis.
- Describe the differences between utility and probability analysis.
- Examine multi-perspective utility analysis and its use by participating in classroom exercises.
- List the 13 steps of multi-perspective utility analysis.
- Apply your knowledge of multi-perspective utility analysis by participating in a classroom exercise.

Class 8 – And Now for Something Completely Different

Reading Assignment: *Review all assigned readings.*

Written Assignment: *None.*

Class Objectives: *At the end of Class 8 you will be able to:*

- Describe which structured analysis methods work best in particular situations.
- Demonstrate knowledge of critical thinking and structured analysis through a practicum.
- Demonstrate your knowledge of critical thinking and structured analysis through a small group exercise.

Class 9 – Final Project Preparation

Reading Assignment: *Review all assigned readings.*

Written Assignment: *None.*

Class Objectives: *During Class 9 you will:*

- Learn through experience the pros and cons of research, analysis and reporting in small teams.

Class 10 – Final Project Presentation and Wrap-up

Reading Assignment: *Review all assigned readings.*

Written Assignment: *None.*

Class Objectives: *During Class 10:*

- Your small group will make a multi-media presentation on the analytic problem you chose.

Methods:

- A sample of the problem statement and restatement process.
- A sample of the convergent and divergent thinking applied to the problem.
- Concise demonstrations of the three structured analytic methods used to answer the analytic problem.

Assessment:

- **You are evaluated on how clearly the group presents its project, and on whether the project requirements listed above are met as shown on the last page of the syllabus.**

Reading Summary Questions:[231]

For each chapter/work, answer the following questions (in writing) about the reading.

1. What is the author's purpose? If there is more than one main point, what is the overarching purpose?

2. What are the key questions the author raises/addresses?

3. What evidence does the author provide to support his argument?

4. What inferences does the author make from the evidence?

5. On what underlying concepts does the author rely?

6. What does the author take for granted? What assumptions does the author make?

7. What are the implications of the author's point of view? What are the implications if we adopt/do not adopt what the author recommends?

8. What is the author's point of view? What other points of view are there?

231 Paul and Elder, *Concepts and Tools*, 13.

Final Project Evaluation Worksheet[232]

	Clarity	Accuracy	Precision	Relevance	Depth	Breadth	Logic	Significance	Fairness
Purpose									
Key Questions									
Assumptions									
Evidence									
A: Methods									
B: Analysis									
Concepts									
Inferences									
Implications									
Other Points of View									
Lessons Learned									
Comments

About the Author

David T. Moore is a career senior intelligence analyst and technical director at the National Security Agency where he is an advocate for, and mentor of best practices in intelligence analysis. He is an adjunct faculty member of the National Cryptologic School; has taught at the National Defense Intelligence College, Washington, DC; and at Trinity University, Washington, DC. Mr. Moore holds a B.A. in sociology from Washington and Lee University and a Master of Science of Strategic Intelligence from the National Defense Intelligence College (formerly the Joint Military Intelligence College).

Mr. Moore's other publications include:

- "Species of Competencies for Intelligence Analysis," *Defense Intelligence Journal,* 11, no. 2 (Summer 2002): 97-119.
- "Species of Competencies for Intelligence Analysis," *American Intelligence Journal*, 23 (2005): 29–43 (an expanded version of the original article).
- With coauthor Lisa Krizan:
    - "Intelligence Analysis, Does NSA Have What it Takes," *Cryptologic Quarterly,* 20, nos. 1/2 (Summer/Fall 2001): 1-32.
    - "Core Competencies for Intelligence Analysis at the National Security Agency," in *Bringing Intelligence About: Practitioners Reflect on Best Practices,* Russell Swenson, ed. (2004): 95-131.

Colophon

A colophon records the details of the layout and design of a publication. It acknowledges the craftsmanship and art required in creating a printed work. Whereas the acknowledgements record the textual assistance an author receives, a colophon records the equally important technical assistance received.

This Occasional Paper was set in Baskerville, a transitional typeface created by Birmingham printer John Baskerville around 1752. George Jones redesigned it in 1930 for Linotype-Hell; the International Typeface Corporation licensed it in 1982. The long, elegant serifs and the subtle transfer of stroke weight from thick to very thin give it a delicacy and grace that makes it an excellent text typeface. Titling and primary headings were set in Castellar, a Monotype typeface created by John Peters in 1957. Named after a town in the Alps, Castellar also was designed for refined display work. Tables were set in Gill Sans, designed by artist and type designer Eric Gill in 1931 for Monotype. Unlike many sans serif typefaces it is highly legible and readable in text. The cover was set in Californian, a typeface originally designed by Frederic Goudy in 1938 and adapted by various designers for the Font Bureau.

This publication was composed on an Apple iMac and a Macbook Pro using Adobe Systems InDesign. Masters were created in Adobe Acrobat. Illustrations were prepared in Omni Systems Omni Graffle and Adobe Photoshop.

Baskerville, Californian, Castellar, Gill Sans, iMac, Macbook Pro, Acrobat, InDesign, Omni Graffle, and Photoshop are registered trademarks of their respective companies.

Desktop composition by the author.

The cover was designed by Bridgette White.

Published by the National Defense Intelligence College Press, May 2006; and by the National Defense Intelligence College Foundation, March 2007. Printed at the Defense Intelligence Agency, Washington DC.

This Air Force Handbook (AFH) is the reference guide for conducting intelligence analysis as prescribed by Air Force Policy Directive (AFPD) 14-1, *Intelligence, Surveillance, and Reconnaissance (ISR) Planning, Resources and Operations* and supports the operational requirements and processes outlined under Air Force Instruction (AFI) 14-133, *Intelligence Analysis* and AFI 14-134, *Intelligence Analysis Production and Requirements Management*. This publication provides the definitions, guidelines, procedures and tools for intelligence analysis operations. It has application and use for Regular Component, Air Force Reserve (AFR), Air National Guard (ANG), and Department of the Air Force (AF) Civilians, except where noted otherwise. Ensure that all records created as a result of processes prescribed in this publication are maintained in accordance with (IAW) Air Force Manual (AFMAN) 33-363, *Management of Records*, and disposed of IAW the Air Force Records Disposition Schedule (RDS) in the Air Force Records Information Management System (AFRIMS). Refer recommended changes and questions about this publication to the Office of Primary Responsibility (OPR) using the AF Form 847, *Recommendation for Change of Publication*; route AF Forms 847 from the field through the appropriate functional chain of command. This publication may be supplemented at any level, but all direct supplements are routed to the OPR of this publication for coordination prior to certification and approval. Major Commands (MAJCOMs) need to provide a copy to the OPR upon publication. The use of the name or mark of any specific manufacturer, commercial product, commodity, or service in this publication does not imply endorsement by the AF.

Chapter 1

OVERVIEW

1.1. Purpose.

1.1.1. The responsibilities of the intelligence analyst have never been more important. The increasingly complex global environment demands analyst Airmen be steeped in tradecraft fundamentals, conversant on the Intelligence Community (IC) and other service capabilities, and prepared to tailor their analysis skills to the operational challenge at hand. The purpose of this non-directive publication is to help guide every analyst Airman in answering this call. It provides reference and instructional material for the analyst Airman working in the air, space, and/or cyber domains—whether junior or seasoned; officer, enlisted, or civilian; regular AF, reserve or guard; and serving AF, joint, national, or combined missions. The content of this publication is intentionally broad in nature, ranging from foundational doctrine and tactics, techniques, and procedures (TTPs) to analysis applications and lessons learned.

1.1.2. The long-term intent for this publication is to have it reside as a series of interactive and up-to-date web pages online, with links to IC and AF directives, templates, checklists, and other references. The online version will serve as a useful tool for the analyst Airman to quickly link to their specific analysis topic of interest. Upon publication of this handbook, the AF intends to initiate steps to transition this document to an online, interactive version.

1.1.3. The publication is organized with foundational information in six main chapters followed by useful lists, lessons learned, criteria, forms, guides, and an annotated bibliography in the attachments to aid analyst Airmen in their day-to-day missions. This document also includes links to appropriate websites with additional support material.

1.2. Intelligence Analysis. Intelligence analysis is a cognitive capability—both art and science—applying tools, judgments, processes, and tradecraft to data and information to create and deliver new intelligence, insights, and knowledge, with the goal of providing decision advantage to commanders, decision makers, and intelligence customers. Analysis is foundational to ISR, a key capability of ISR, a core competency in ISR, and integral to Global Integrated ISR (GIISR).

1.2.1. Intelligence as a Foundation. Analysis is a significant capability that extends across all AF ISR Enterprise activities in support of the full range of military operations and assigned national security missions. According to AF/A2's vision for the future of AF Intelligence, *AF ISR 2023: Delivering Decision Advantage*, a "fundamental job of AF ISR Airmen is to analyze, inform, and provide commanders at every level with the knowledge they need to prevent surprise, make decisions, command forces, and employ weapons." AF intelligence analysis provides unique capabilities to focus on and address AF mission requirements. These same unique capabilities, coupled with an Airman's distinctive air/space/cyber perspective, serve to complement and fully integrate with analysis that supports broader defense and national mission requirements.

1.2.2. Intelligence Analysis as a Capability. Analysis is one of four enduring AF ISR capabilities, the other three being Collection Operations, Targeting, and Operations

Integration. **Note**: Refer to the *AF Future Operating Concept: A View of the AF in 2035*. The AF delivers intelligence analysis capability to meet Combatant Command (CCMD) and service needs. As with any other capability area, intelligence analysis is supported by the full range of Doctrine, Organization, Training, Materiel, Leadership and Education, Personnel, Facilities, and Policy (DOTMLPF-P).

1.2.2.1. Doctrine. Doctrinal considerations include analysis fundamental principles; analysis policy and procedures; common lexicon and terminology; recognized TTPs; and shared best practices and lessons learned.

1.2.2.2. Organization. AF ISR organizations range from the tactical to the strategic level, operating in a layered, distributed, and mutually supporting construct. AF initiatives to develop the intelligence analysis capability additionally impact the presentation of analyst Airmen to joint organizations such as combatant commands, joint task forces, and national analysis entities.

1.2.2.3. Training. Considerations include initial, mission, and continuation training; AF Specialty Code (AFSC) entry-, intermediate-, and advanced-level courses; and associated certification.

1.2.2.4. Materiel. Materiel concerns involve tools, technologies, systems, and architectures necessary to equip, operate, maintain, and support analysis activities.

1.2.2.5. Leadership and Education. The attention and priority of leadership is essential to growing the analysis capability. Additionally, undergraduate- and graduate-level education opportunities inside and outside of the AF play a major role.

1.2.2.6. Personnel. Planning and resourcing for qualified personnel are required to effectively conduct analysis missions.

1.2.2.7. Facilities. Cleared and adequately equipped buildings and other structures are required to conduct analysis.

1.2.2.8. Policy. Codified direction and guidance with clearly defined roles, responsibilities, processes, and terminology are fundamental to unity of effort across the AF ISR enterprise.

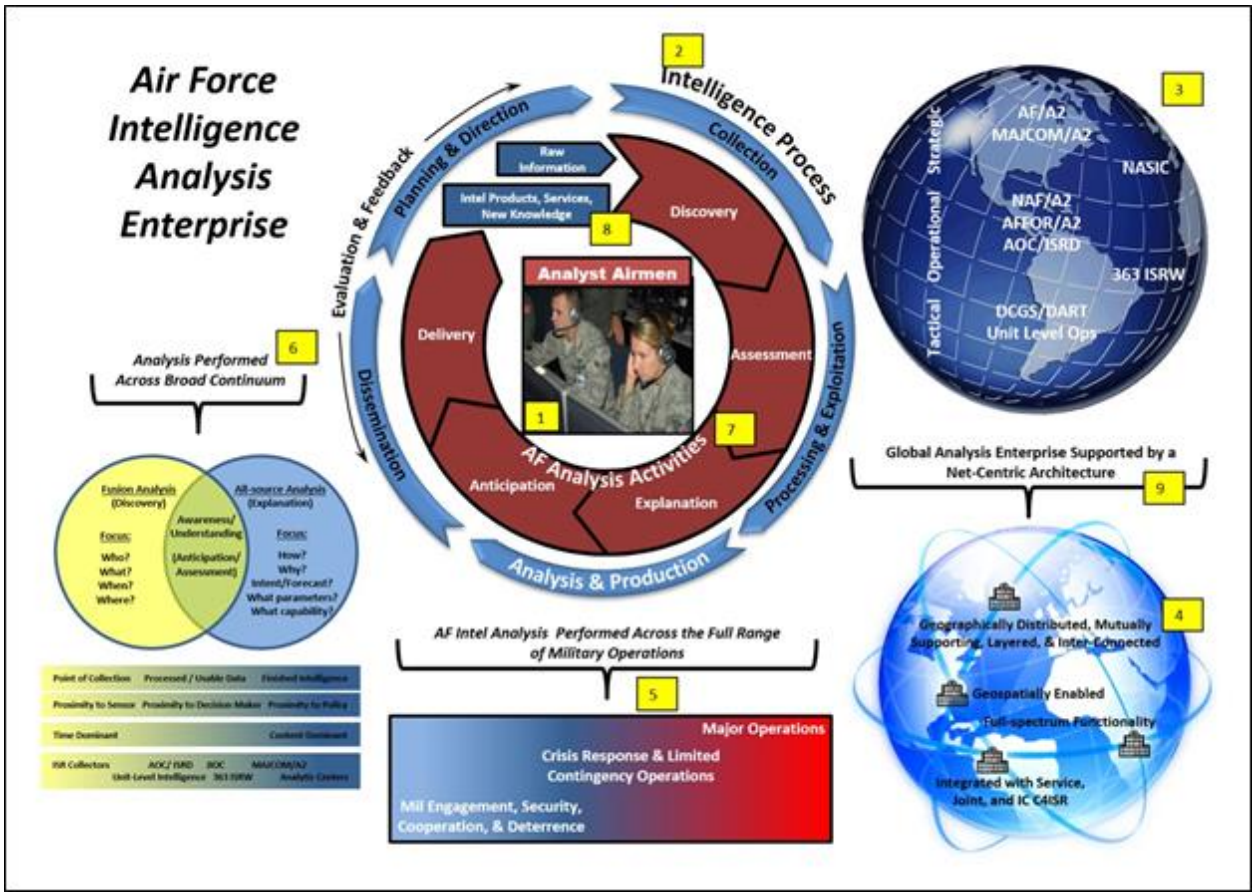
1.2.3. Intelligence Analysis as a Core Competency. ISR core competencies are the primary knowledge, skills, abilities, and behaviors required to perform AF ISR missions and ultimately enable decision advantage. The AF strives to collectively maintain sufficient expertise in its competencies. Because analysis is critical to and a driving factor in the other three enduring capabilities, all AF ISR professionals train in, maintain, and exercise, at a minimum, basic analytical capabilities and critical thinking skills wherever they are assigned. Additional information on this subject can be found in Career Field Education and Training Plan (CFETP) 14NX, Parts I and II, *AFSC 14NX Intelligence Officer Career Field Education and Training Plan* and CFETP 1N0X1, Parts I and II, *AFSC 1N0X1 All Source Intelligence Analyst Career Field Education and Training Plan*.

1.2.4. Intelligence Analysis and Global Integrated ISR (GIISR). As of 2017, GIISR is one of the AF's five enduring core missions as identified in strategic guidance, including the *AF Future Operating Concept* and the *USAF Strategic Master Plan*. A key strategic AF vector is to maintain a robust and flexible GIISR capability, supported by big data analytics. AF

strategic guidance highlights the need for the service to deepen its assessment of potential adversaries, professionalize ISR analysis, and restore analytic competencies. In turn, AF ISR vision and strategic planning establish analysis as one of five priorities for ISR and tie the AF's mandate to deliver decision advantage to its ability to provide world-class, multi- and all-source intelligence across all domains. Accurate, timely, relevant intelligence analysis is not only integral to operations, but in many ways drives military operational decisions.

1.3. Operational Viewpoint-1 (OV-1). Figure 1.1, *AF Intelligence Analysis OV-1*, offers a high-level depiction of AF intelligence analysis. The OV-1 describes analysis operations, capabilities, and activities within the greater AF ISR Enterprise and explains how analysis supports GIISR operations. Together, analyst Airmen and the AF Intelligence Analysis Enterprise (AFIAE) ensure mission success and decision advantage now and into the future. Subsequent chapters of this publication explain in more detail the various elements of the OV-1.

Figure 1.1. AF Intelligence Analysis OV-1.



1.3.1. As indicated by Item 1 in Figure 1.1, at the heart of AF intelligence analysis is the cadre of officer, enlisted, and civilian ISR professionals who are trained in intelligence analysis and production. These analyst Airmen apply critical thinking and advanced analytical skills to turn information and raw data into timely, actionable, and relevant intelligence products and services, leading to improved knowledge.

1.3.2. Analyst Airmen perform their missions within the framework of the overall joint intelligence process of Planning and Direction, Collection, Processing and Exploitation,

Analysis and Production, Dissemination and Integration, and Evaluation and Feedback (PCPAD), as Item 2 of Figure 1.1 illustrates.

1.3.3. Item 3 in Figure 1.1 indicates that AF intelligence analysis is nested within the larger AF ISR Enterprise, a Total Force construct extending from squadron to headquarters level and ranging from tactical to strategic focus.

1.3.4. As depicted in Item 4 of Figure 1.1, analyst Airmen and the AF ISR Enterprise are mutually supporting; unified in policy, authorities, tenets, and strategy; and skilled in employing tools that enable AF, joint, and IC operations.

1.3.5. Analyst Airmen are trained in the art and science of analytical tradecraft and apply common tenets and standards across the full range of military operations, from major theater warfare to humanitarian assistance and disaster relief, as depicted in Item 5 of Figure 1.1.

1.3.6. To support these operations, analyst Airmen engage in various types of analysis, ranging from fusion analysis to all-source analysis (ASA), as shown in Item 6 of Figure 1.1. Fusion analysis entails quickly melding new information with already established baseline knowledge to meet specific operational needs. Comprehensive ASA is often less time sensitive and more focused on studying and understanding long-term trends and maintaining a depth of knowledge on a given subject. Each organization within the AF ISR Enterprise conducts analysis across this continuum - at varying levels based on key intelligence questions and customer requirements - to fill a gap in knowledge, or a need to improve understanding of the threat environment and/or adversary capabilities.

1.3.7. Common analysis activities performed across the AF ISR enterprise include Discovery, Assessment, Explanation, Anticipation, and Delivery, which operate in parallel with the PCPAD process, as depicted in Item 7 of Figure 1.1. Analyst Airmen identify relevant information in support of ongoing operations and requirements, classify and categorize information, and create estimates of capabilities and impacts.

1.3.8. As Item 8 of Figure 1.1 indicates, the derived knowledge is used to create descriptions in greater context to provide indications and warning regarding a specific problem set. Intelligence products and services are developed, tailored, and presented according to key intelligence questions or customer requirements.

1.3.9. As shown in Item 9 of Figure 1.1, the AF intelligence analysis concept and the AF ISR Enterprise are interconnected by both a net-centric architecture and analytic toolsets that ensure critical interface among AF operational elements, Joint, and IC analysts, thereby ensuring access to all relevant data in a geographically-enabled and integrated manner.

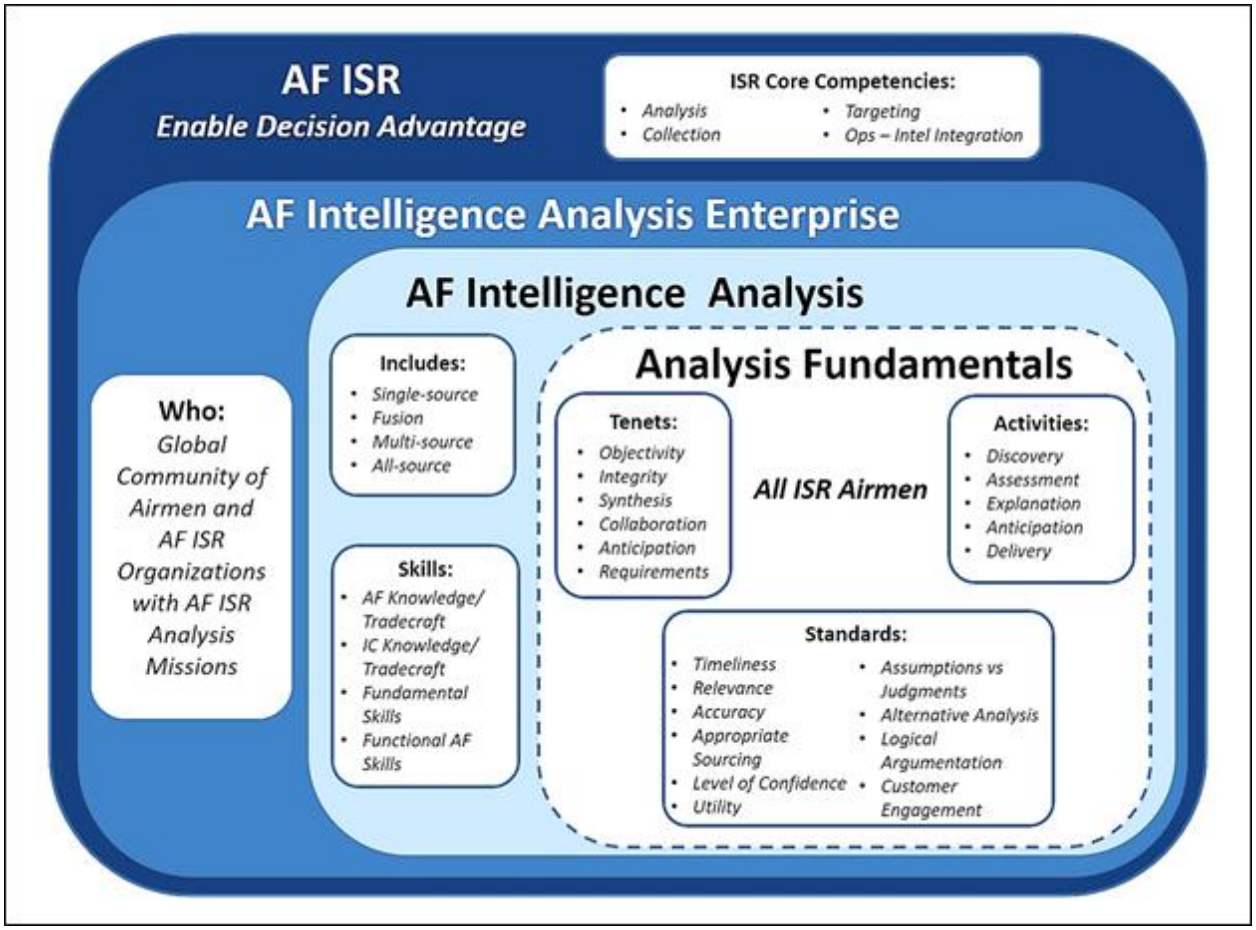
Chapter 2

AF INTELLIGENCE ANALYSIS ENTERPRISE

2.1. Analyst Airmen. An analyst Airman is an AF ISR professional who is skilled and qualified in tradecraft to perform the core competency of intelligence analysis across the air, space, or cyberspace domains. Certification criteria and programs vary based on unit and mission requirements. Analyst Airmen are bound by the professional standards for analysis established by the IC, and supplemented by AF standards and mission qualifications of the assigned ISR unit. Whether ISR professionals are analyst Airmen depends more on what they do than where they sit.

2.2. AF Intelligence Analysis Enterprise (AFIAE) . The enterprise is defined as the global community of analyst Airmen and the AF ISR organizations that employ the core competency of intelligence analysis. Figure 2.1, *AFIAE*, depicts how the AFIAE, intelligence analysis, and analysis fundamentals fit within the larger AF ISR Enterprise. Refer to **Chapter 4** for a detailed explanation of analysis fundamentals. Although not shown in Figure 2.1, the AF ISR Enterprise resides within the IC Enterprise. As a member of the IC, the AF contributes to IC analysis and production and also receives analysis and production support from other IC organizations.

Figure 2.1. AFIAE.



2.3. Analysis Spectrum . Analyst Airmen employ fundamental tenets, standards, and activities to perform analysis across a broad continuum for mission accomplishment. On one end of the analysis continuum are fusion and single-source analysis, with emphasis on timeliness over completeness. On the other end of the spectrum is comprehensive ASA, with less emphasis on rapidity, and greater emphasis on analytic content, depth, trends, technical, and other subject-matter expertise. This spectrum is depicted in Figure 2.2, *AF Spectrum of Intelligence Analysis*.

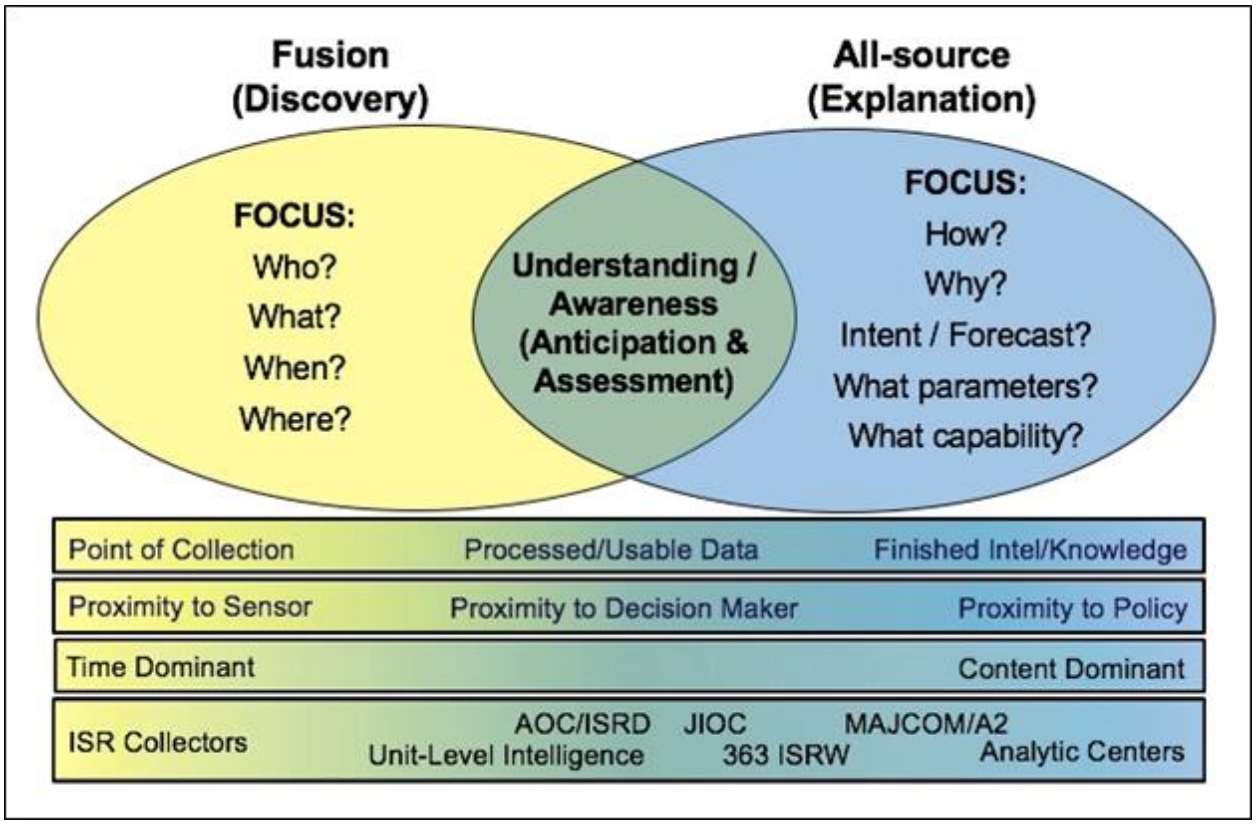
2.3.1. Single-Source Analysis (also called Exploitation). Intelligence analysis that employs a single source or expertise in a functional area to characterize events, people, or things. Such analysis is limited to describing, rather than evaluating, the topic of a particular analysis due to restrictions inherent in single-source intelligence collection, precluding the ability to provide fully contextualized intelligence assessments.

2.3.2. Fusion Analysis. Analysis in a time-sensitive environment in close proximity to the point of collection that entails quickly melding new information with baseline knowledge to meet a specific operational need. **Note:** Proximity does not refer to physical or geographic location but rather functional proximity to the collection step in the intelligence process (for example, a Distributed Common Ground System (DCGS) Analysis and Reporting Team (DART) at Beale AFB may conduct fusion analysis of an operational area on the opposite side of the globe). Emphasis is on the process of managing information and on timeliness over completeness. Fusion analysis generally has three components: 1) it usually includes more than one source; 2) it is time critical; and 3) it is performed to meet a commander's requirements or specific operational need.

2.3.3. Multi-Source Analysis (also called Multi-Intelligence (INT) Analysis). Intelligence analysis that makes use of more than one source when access to additional potential sources is limited by reasons of timeliness, system access, location, or security levels.

2.3.4. All-Source Analysis (ASA). Intelligence analysis that employs all available sources of data and information to enable the creation of new intelligence and knowledge.

Figure 2.2. AF Spectrum of Intelligence Analysis.



2.3.5. At the far left of the graphic, intelligence analysis units, such as AF DARTs, provide near-real-time (NRT), multi-source fusion analysis closest to the point of collection to improve collection, perform dynamic targeting, and support tactical warfighters. Moving to the right across the spectrum, the Air Operations Centers' (AOCs) ISR Divisions (ISRD), Joint Intelligence Operations Centers (JIOCs), and IC organizations provide multi-source and ASA with fewer time constraints and in close proximity to strategic-level commanders and decision-makers to facilitate battlespace awareness, operations planning and sustainment, and policy decisions. Since the late 1990s, changes in technology, operational needs, and CCMD requirements have blurred the once distinct lines of this analysis spectrum. Today AFIAE organizations have evolved to delivery across the spectrum – rather than delivering within any single niche.

2.4. Characteristics of the AF Intelligence Analysis Enterprise (AFIAE).

2.4.1. Layered. Intelligence analysis capabilities reside at multiple levels of command—unit, (squadron, group, wing), Numbered AF (NAF), MAJCOM, and AF-level. Additional levels, including joint and Department of Defense (DoD), exist beyond the AF. Table 2.1, *Layers of Analysis*, identifies the various layers of analysis organizations along with their general analytical focus, typical customers, and timeliness, as modern processes and technologies enable organizations to extend their focus and timelines outside traditional norms. While representative, this table is not a complete listing of all AF analysis organizations.

Table 2.1. Layers of Analysis.

Organization	Focus	Customer	Timeline
CSA (DIA, NSA, NGA, NRO)	Strategic	National leadership, DoD, IC	Days/Months; Mission dependent RT/NRT
CCMD JIOC/JTF	Strategic/Operational	CCMD, Joint forces	Days/Months
Service Intelligence Center (NASIC)	Strategic/Operational/ Tactical	National leadership, CCMD, JTF, DoD, IC, AF all levels, acquisition community	Hours/Days/Months
MAJCOM/A2	Strategic/Operational	MAJCOM staff and supported units	Days/Months
Acquisition Centers	Strategic/Operational	AF/IC leadership, MAJCOMs, acquisition program/project mgrs	Days/Months
NAF/A2, AFFOR/A2, AOC ISR Division	Operational/Tactical	CCMD, JTF/Joint forces, AF NAF and below units	Hours/Days
ISRW	Operational/Tactical	NAF and below units	Hours/Days/Months
DCGS	Operational/Tactical	CFACC, JTF, DoD, IC, AF units	RT/NRT to 72 Hours
Unit Level Intel & RPA SOC	Tactical	AF and other service units	RT/NRT to 72 Hours

AF: Air Force
A2: Director of Intelligence
AFFOR: Air Force Forces
AOC: Air Operations Center
CCMD: Combatant Command
CFACC: Combined Forces Air Component Commander
CSA: Combat Support Agency
DCGS: Distributed Command Ground System
DIA: Defense Intelligence Agency
DoD: Department of Defense
IC: Intelligence Community
ISR: Intelligence, Surveillance & Reconnaissance
ISRW: ISR Wing
JIOC: Joint Intelligence Operations Center
JTF: Joint Task Force
MAJCOM: Major Command
Mgrs: Managers
NAF: Numbered Air Force
NASIC: National Air and Space Intelligence Center
NGA: National Geospatial-Intelligence Agency
NRO: National Reconnaissance Agency
NRT: Near-real-time
NSA: National Security Agency
RPA: Remotely Piloted Aircraft
RT: Real-time
SOC: Squadron Operations Center

2.4.1.1. Starting at the bottom of Table 2.1, unit-level intelligence organizations focus on tactical analysis needs (e.g., location, movement, and readiness of enemy forces) for their tactical-level customers in the AF and other services. Unit-level intelligence organizations typically operate under short timelines from real-time or NRT to several days out.

2.4.1.2. DCGS units are tactically and operationally focused. Within each DCGS unit, the DART conducts analysis for their respective CFACC as well as other IC and DoD customers. DARTs operate in a time sensitive environment but can support the customer up to the operational level of ISR planning. Their main emphasis is fusion analysis.

2.4.1.3. ISR wings provide both operational and tactical level intelligence analysis, with timelines ranging from hours to months. In particular, the 363 ISR Wing (ISRW) is dedicated to providing all-source analysis and targeting intelligence to NAFs and below across the entire AF.

2.4.1.4. NAF/A2s, AF Forces (AFFOR)/A2, and AOC ISRDs are operationally and tactically focused in support of their associated CCMD, their joint task force (JTF), and/or their units. Their typical timelines are hours to days.

2.4.1.5. Intelligence offices within Acquisition Centers, such as the Space and Missile Systems Center (SMC), AF Life Cycle Management Center (AFLCMC) and AF Research Laboratory (AFRL), provide both strategic and operational intelligence for acquisition program managers, project managers, MAJCOMs, and AF/IC leadership, with timelines that range from days to months.

2.4.1.6. MAJCOM/A2s provide strategic and operational analyses for their MAJCOM staff and supported units, usually ranging from days to months. The Air Mobility Command (AMC)/A2 is unique in that its Air Intelligence Squadron (AIS) and the 204th Intelligence Squadron (ANG) provide direct analytic support to 18 AF and subordinate units in the conduct of their rapid global mobility missions. Additionally, U.S. Air Forces in Europe & Air Forces Africa (USAFE-AFAFRICA) and Pacific Air Forces (PACAF) are unique as Component MAJCOMs (C-MAJCOMs) in that they have the responsibility of analytically representing the Joint Force Air Component Commander to the Joint Force Commander.

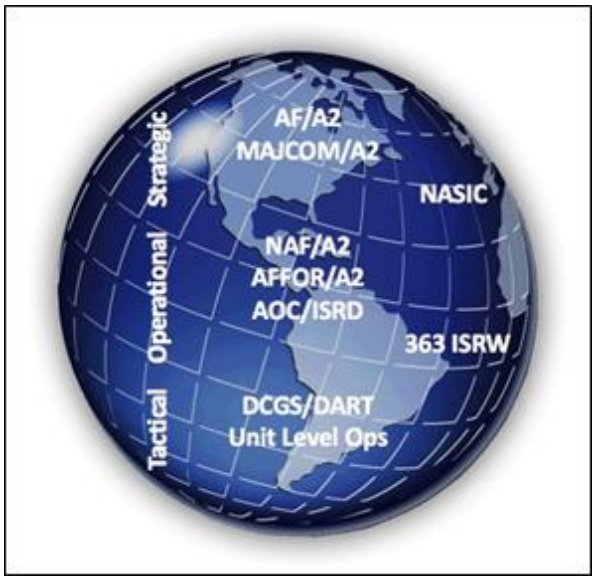
2.4.1.7. The National Air and Space Intelligence Center (NASIC**)** conducts strategic, operational, and tactical analysis for a broad range of customers in the AF, DoD, and IC as well as and including national leadership and the acquisition community. Their timelines extend from short-term to long-term, depending on the customer's needs. Whereas the 363 ISRW is the primary AF organization that conducts tactical intelligence analysis, NASIC is the primary AF organization focused on strategic intelligence. Both the 363 ISRW and NASIC provide significant analysis at the operational level, as well. Further, while other AF layers conduct analysis as part of their mission, analysis is a primary mission of the 363 ISRW and NASIC.

2.4.1.8. Joint intelligence organizations at CCMDs and JTFs conduct strategic and operational analysis in support of their respective regional and functional commands. The timelines of their analysis range from days to months.

2.4.1.9. Combat Support Agencies (CSAs) focus primarily on strategic analysis for national leadership, DoD, and the IC. Although they usually operate on timelines ranging from days to months, they also provide real-time and near-real-time analysis as requirements dictate.

2.4.2. Distributed and Mutually Supporting. In addition to being layered, analysis responsibilities are distributed across geographic regions and functional areas in the AF (see Figure 2.3, *Layered, Distributed, and Mutually Supporting Nature of AFIAE*). Analysis organizations in every layer and every region/function are interconnected and have access to each other. Organizations collaborate and share expertise to ensure the most accurate, timely analysis is provided to answer intelligence requirements. The mutually supporting nature of the AFIAE includes enterprise partners, such as the AF Office of Special Investigations (AFOSI).

Figure 2.3. Layered, Distributed, and Mutually Supporting Nature of AFIAE.



Chapter 3

THE NATIONAL INTELLIGENCE ANALYSIS COMMUNITY AND THE AIR FORCE

3.1. The Intelligence Community. The IC is a coalition of 17 agencies and organizations, including the Office of the Director of National Intelligence (ODNI), within the Executive Branch that work both independently and collaboratively to gather and analyze the intelligence necessary to conduct foreign relations and national security activities. See Attachment 6, Table A6.1, *Members of the IC*, for a complete list of IC organizations.

3.1.1. The Director of National Intelligence (DNI) has overall responsibility for intelligence support to the President and the day-to-day management of the IC. AF analysis falls under the governance and direction of the DNI. The AF is an active participant in governance and oversight forums and follows the analytical priorities, standards, processes, and procedures established by the IC. The DNI issues guidance for analysis and production through IC Directives (ICDs), IC Standards (ICSs), DNI memorandums, and other directive documents. The IC documents that most often impact AF analysis are identified in Attachment 6, Table A6.2, *Common IC and DoD Analysis References*.

3.1.2. DoD Intelligence.

3.1.2.1. The Secretary of Defense (SecDef) is responsible for the DoD portion of the IC. The Under Secretary of Defense for Intelligence (USD(I)) serves as the senior defense intelligence, counterintelligence, and security official below the SecDef and Deputy SecDef. For defense intelligence analysis the USD(I):

3.1.2.1.1. Provides oversight and direction for analysis capabilities to ensure effective support to the DoD mission.

3.1.2.1.2. Ensures analysis is aligned with IC and DoD analytical concepts, methodologies, and priorities.

3.1.2.1.3. Establishes DoD all-source analysis policy and oversees the implementation of DoD all-source analysis plans, programs, and performance.

3.1.2.1.4. Provides strategic guidance to the Defense Intelligence All-Source Analysis Enterprise (DIAAE), the collective set of all DoD organizations that execute all-source analysis activities in production of defense intelligence.

3.1.2.1.5. Develops and maintains the consolidated set of Defense Intelligence priorities that guides DIAAE analysis and reflects the intelligence needs of all Defense Intelligence consumers.

3.1.2.1.6. Establishes the DIAAE Board of Governors (BOG), a body of representatives from the DIAAE organizations that provides a forum for addressing issues, improving transparency, implementing strategies, and making resource recommendations across the DIAAE.

3.1.2.2. The AF participates in the DIAAE BOG and other DoD analysis forums and adheres to DoD analysis-related policies. Within the DoD, the agency with the largest responsibility for promulgating ASA guidance is the Defense Intelligence Agency (DIA).

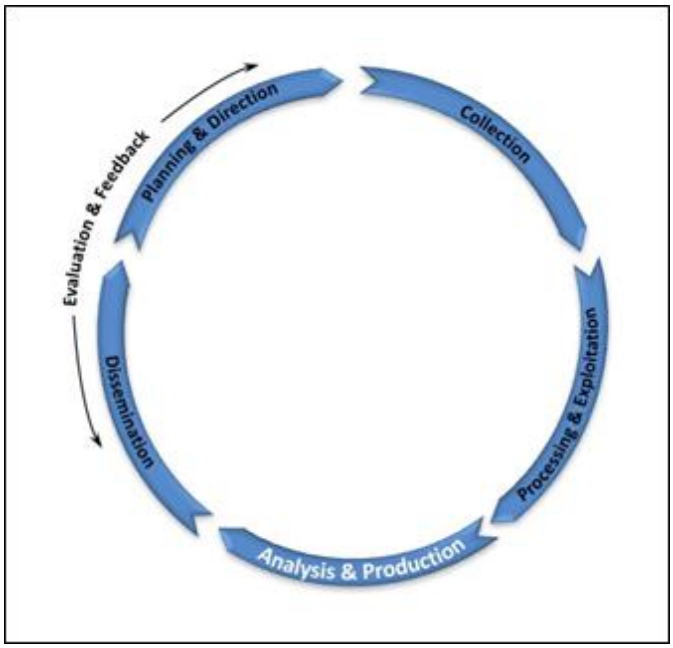
DIA governs ASA responsibilities, policies, priorities, and relationships across the DoD IAW DoD Instruction (DoDI) 3115.17 and as the DoD Functional Manager for ASA. Additionally, DIA manages the Defense Intelligence Analysis Program (DIAP), with the primary goal of maximizing enterprise efficiencies through clearly defined ASA and production responsibilities among DIA, CCMDs, and service intelligence centers.

3.1.2.3. In addition to ASA and production conducted within the DIAP, the AF conducts single-source analysis, e.g., signals intelligence, human intelligence, geospatial intelligence, etc., that is additionally governed by directives established by respective lead DoD agencies. AF production that supports these single-source disciplines adheres to AF guidance as well as standards set forth by the respective DoD lead agencies. Further, the DoD has established overarching policy related to acquisition intelligence, to which the AF adheres. If a conflict arises between the AF and IC agency guidance, IC guidance takes precedence. See Attachment 6, Table A6.2, *Common IC and DoD Analysis References*, for a list of common DoD analysis-related documents.

3.1.3. Military Services. Each military service has a senior intelligence officer (SIO) that oversees intelligence policy, planning, programming, and activities on behalf of the service chief. The AF SIO is the Deputy Chief of Staff (DCS) for ISR, also known as the AF/A2. Each service is authorized one service intelligence center, also called an intelligence analysis center. The AF's service intelligence center is NASIC. The AF has assigned the Air Combat Command (ACC) as its lead MAJCOM for the GIISR capability, which includes intelligence analysis. Similarly, other military services have assigned significant analysis responsibilities to various organizations. All services routinely reach out to each other for service-unique expertise and collaboration in addressing analysis requirements. Refer to Attachment 6, Table A6, *Major Intelligence Analysis Entities of the Military Services*, and Table A6.4, *Common Analysis Organizations*, for a breakdown of the major intelligence analysis entities in each military service and a list of service and other government agencies organized according to the primary analysis they conduct.

3.2. Intelligence Analysis and the Joint Intelligence Process. As highlighted in Joint Publication (JP) 2-0, *Joint Intelligence*, the intelligence process is comprised of six interrelated categories, collectively referred to as PCPAD. Refer to Figure 3.1, *Joint Intelligence Process*, for a graphic depiction of the PCPAD cycle. The PCPAD process is universally recognized throughout the IC and linked to the DoD Joint Capability Area (JCA) of Battlespace Awareness. JCAs provide a common framework for defining needs, analyzing operational gaps, and conducting planning and, by extension, programming for DoD capabilities.

Figure 3.1. Joint Intelligence Process.



3.2.1. Planning and Direction is dependent on the ability to synchronize and integrate the activities of collection, processing, exploitation, analysis and dissemination resources to meet Battlespace Awareness information requirements. Planning and direction activities include, but are not limited to: the identification and prioritization of intelligence requirements; the development of concepts of intelligence operations and architectures required to support the commander's mission; tasking subordinate intelligence elements for the collection of information or the production of finished intelligence; submitting requests for additional capabilities to higher headquarters; and submitting requests for collection, exploitation, or all-source production support to external, supporting intelligence entities. Planning and direction occurs continuously and allows for the prioritization of intelligence support across all ongoing operations and simultaneous planning efforts.

3.2.2. Collection is the ability to gather data and obtain required information to satisfy requirements. Collection is managed by collection managers, whose duties include identifying the most appropriate available assets and then tasking those assets to conduct collection missions. Collection managers also develop and coordinate sensor employment guidance, exercise authoritative control of specific collection operations, revise collection activities as required, monitor the overall satisfaction of requirements, and assess the effectiveness of the collection plan to satisfy the original and evolving intelligence need.

3.2.3. Processing and Exploitation involves the transformation of collected information into formats suitable for further analysis and/or action by man or machine. During processing and exploitation, raw collected data are converted into forms that can be readily used by commanders, decision-makers at all levels, intelligence analysts, and other consumers. Processing and exploitation includes first-phase imagery exploitation, data conversion and correlation, document and media translation, and signal decryption, as well as reporting the results of these actions to analysis and production elements.

3.2.4. Analysis and Production involves the integration, evaluation, and interpretation of information obtained from available sources to develop intelligence and forecast the future state to enable situational awareness and provide new knowledge/actionable information. The AF has identified five activities that occur within this category of the PCPAD process: Discovery, Assessment, Explanation, Anticipation, and Delivery. See **Chapter 4** for a description of each, along with an explanation or how it relates to broader AF ISR activities, and the tenets and standards to which analyst Airmen adhere in order to carry out these five analysis activities.

3.2.5. Dissemination and Integration focuses on the ability to present, distribute, or make available to military and national decision-makers the intelligence, information and environmental content and products that enable understanding of the operational/physical environment. Personal, networked, and database data transfers are all means of dissemination. The diversity of dissemination paths requires a high degree of communications and system interoperability among joint and multinational forces, component commands, DoD organizations, and the interagency community.

3.2.6. Evaluation and Feedback occur continuously throughout the intelligence process. It requires a collaborative dialogue among intelligence planners, collection managers, collectors, analysts, intelligence systems architects, and customers. The intent of evaluation and feedback is to identify potential problems as early as possible to minimize information gaps and mitigate capability shortfalls.

3.2.7. Although “analysis” is specifically identified in the Analysis and Production category of PCPAD, most intelligence analysts agree that analysis takes place in all categories of the joint intelligence process.

3.3. IC Funding. The National Intelligence Program (NIP), administered by the DNI, provides guidance and funding for a broad range of ISR activities within the IC. NIP is divided into sub-programs, including the General Defense Intelligence Program (GDIP) for ASA and other specific intelligence activities, the Consolidated Cryptologic Program (CCP) for signals intelligence activities, and the National Geospatial-Intelligence Program (NGP) for geospatial intelligence activities. Some AF intelligence organizations receive funding through these NIP sources for certain single-source and ASA missions and are required to adhere to the analysis and production guidelines and standards associated with the funding. However, the majority of AF analysis activities, particularly at and below wing level, are funded through the Military Intelligence Program (MIP) for mission execution. For details, refer to ICD 104, *National Intelligence Program (NIP) Budget Formulation and Justification, Execution, and Performance Evaluation* and DoDD 5205.12, *Military Intelligence Program (MIP).*

3.4. Quality Analysis Programs . The IC and AF offer a variety of analyst enrichment opportunities to broaden and deepen an analyst's experience and expertise. Some examples include the AF Quality of Analysis Program, DNI Quality of Analysis Program, National Intelligence University, DIA's Intelligence Community Advanced Analytical Program, and the AF Institute of Technology.

3.5. AF National Tactical Integration (AF NTI) . The AF NTI program integrates U.S. Signals Intelligence (SIGINT) System resources with theater air and space components to ensure seamless support. The AF NTI team shifts the focus of national SIGINT performance from discovering and reporting data to collaboratively generating actionable intelligence for the Joint

Force Air Component Commander. The AF NTI team capitalizes on data acquisition capabilities, existing databases and datalinks of multiple national SIGINT sources, and access to AF analysts in the AOC, National Cryptologic Centers, and AF intelligence production organizations (e.g., NASIC). While the program remains predominately SIGINT focused, the AF NTI enterprise also has the ability to leverage all AF ISR capabilities. **Note**: Refer to AF ISR Agency Instruction (AFISRAI) 14-153 Volume 3, 480 ISRW Supplement, *Air Force Distributed Common Ground System (AF DCGS) Operations Procedure*s.

Chapter 4

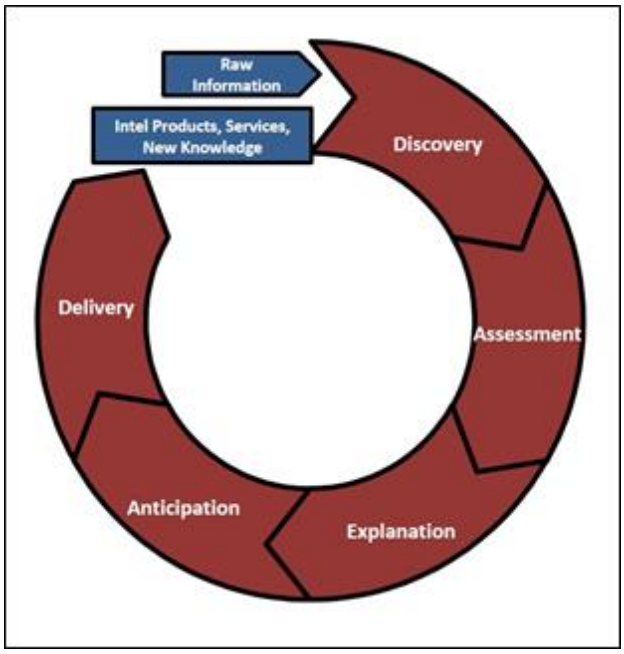
ANALYSIS FUNDAMENTALS–ACTIVITIES, TENETS, & STANDARDS

4.1. AF ISR Capabilities . The AF *GIISR Core Function Concept* highlights five enduring core capabilities (refer to Figure 4.1, *Enduring GIISR Capabilities*) that directly support the JCA of Battlespace Awareness. As previously mentioned, this JCA delineation is key for defining analysis-specific needs, analyzing gaps, and for planning and programming against AF analytic requirements. Similar to the joint PCPAD intelligence process discussed in **Chapter 3**, analysis is an essential and integral component of each of the five enduring GIISR capabilities.

Figure 4.1. Enduring GIISR Capabilities.

4.2. AF Intelligence Analysis Activities . As depicted in Figure 4.2, *AF Intelligence Analysis Activities*, analyst Airmen commonly perform five activities in support of the GIISR enduring capabilities mentioned above.

Figure 4.2. AF Intelligence Analysis Activities.



4.2.1. Discovery is the ability to research, select, manipulate, and correlate data from multiple sources to identify information relevant to ongoing operations and requirements. Discovery is about researching, better organizing, and using the data we already possess; it is also about finding previously hidden patterns and anomalies.

4.2.2. Assessment is the ability to provide focused examination of data and information about an object or an event, to classify and categorize it, and to assess its reliability and credibility in order to create estimates of capabilities and impacts. Assessment is how intelligence determines what our consumers ought to be concerned with.

4.2.3. Explanation is the ability to examine events and derive knowledge and insight from the interrelated data in order to create descriptions and propose significance in greater context. Explanation is how intelligence provides consumers with narrative stories, relates events to broader situations, and identifies the core of "what is going on."

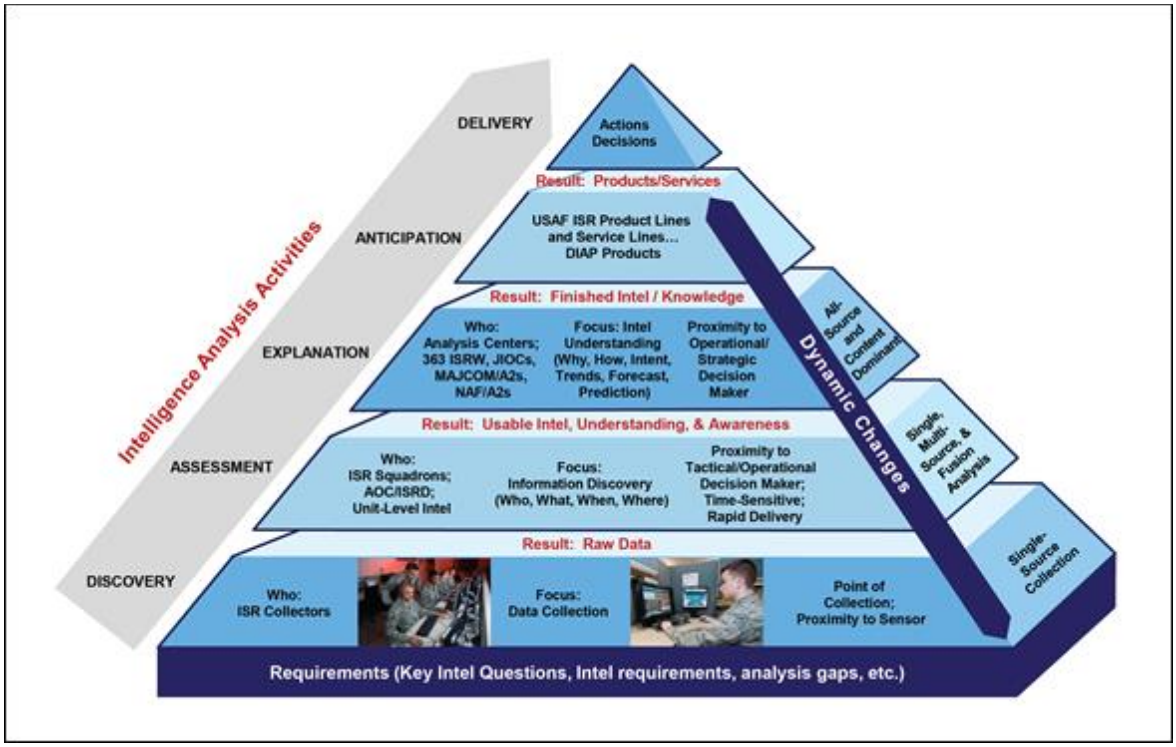
4.2.4. Anticipation is the ability to warn and describe future states of the environment based on the manipulation and synthesis of past and present data. Anticipation includes near-term warning and longer-term forecasting to alert and prepare decision makers for events that could be relevant to their responsibilities.

4.2.5. Delivery is the ability to develop, tailor, and present intelligence products and services according to customer requirements and preferences. Delivery is about classic intelligence products—from tactical reports to in-depth intelligence estimates—and a myriad of intelligence services, ranging from interactive displays and operational pictures, to multimedia crew threat briefings and tablet-embedded, dynamic intelligence assessments, enabling real-time analyst response to requests for information. Delivery is often referred to as production and/or dissemination.

4.2.6. As Figure 4.3, *AF Intelligence Analysis Continuum*, depicts, analysis activities take place across a continuum within the AF, starting with the development of requirements;

progressing through data collection, information discovery, and intelligence understanding; and culminating in services and products that impact commanders' decisions and military actions.

Figure 4.3. AF Intelligence Analysis Continuum.



4.3. AF Intelligence Analysis Tenets. AF tenets of analysis derive from and support IC, joint intelligence, and broader ISR principles, while simultaneously emphasizing analysis attributes of particular interest and priority within the AF. These are the overarching principles held to be true and in common by AF ISR professionals. Collectively, these six tenets cover the most important beliefs about AF intelligence analysis. According to AFI 14-133, while effort should be taken to apply all of these tenets, situations may dictate not all of them being used. The following descriptions are excerpts from AFI 14-133.

4.3.1. Objectivity. Analysis should be based on fact and be clear and truthful about what is *known versus what is judged*. It should *not be distorted by emotion or personal or organizational bias* and shall *be independent of command or political considerations*. Further, it should clearly delineate underlying intelligence, assumptions, and judgments. Analysts should address alternative perspectives and contrary information and avoid being unduly constrained by previous judgments.

4.3.2. Integrity. While closely linked to objectivity, integrity involves a broader focus on all activities, standards, and processes associated with AF intelligence analysis. Integrity calls for *complete honesty* and *reliability in analysis* combined with firm adherence to a code of *professional ethics* and *tradecraft standards* such as *accuracy, timeliness,* and *customer responsiveness*. Integrity includes explaining changes in previous analytic judgments, as well as addressing significant differences in judgment among various U.S. analytic elements.

As stated in JP 2-0, integrity is "the cardinal element in intelligence analysis and reporting, and the foundation on which credibility with the intelligence consumer is built."

4.3.3. Synthesis. AF intelligence analysis requires analysts to *use all available sources of information to maximize completeness*. Analysts should also identify information gaps and, where they exist, they should coordinate with collectors to develop access and collection strategies. Synthesis requires well-honed tradecraft skills, including critical thinking, alternative analysis, and the ability to take the perspective of the adversary. Compatible, service-oriented information technology architectures and tools are also key to facilitating synthesis.

4.3.4. Collaboration. Analysts must *actively solicit opinions and assessments from other analysts and seek to share ideas*. Data, information, and intelligence must be broadly accessed and shared. *Collaboration* should take place internally within the AFIAE, across the IC, and with allies, academia, and other entities outside the IC, when feasible. *Effective collaboration facilitates maximum synthesis*.

4.3.5. Anticipation. Analysis is far more than trend assessment; its true *value resides in warning* and forecasting to be relevant to *decision making, warfighting, operations,* and *acquisition*. Because *information gaps routinely limit our ability to predict with complete accuracy,* it is incumbent on analysts to effectively apply tradecraft standards such as alternative analysis, levels of confidence, assumptions vs. judgments, and appropriate sourcing. Intelligence warning and forecasting are not exact; however, analysts should utilize the most recent data/information for all warning or forecast-related analysis.

4.3.6. Requirements. The AF intelligence analysis mission is motivated by *continuous engagement with customers* to comprehend dynamic needs. Customer requirements can be solicited from a variety of sources such as: understanding their operations; holding working groups or technical exchanges with them; anticipating and listening to their questions; responding to feedback; and addressing documented need statements and derivative data needs. Effectively meeting analysis mission requirements demands an effective balance of customer familiarity, interpreted needs, collaboration, and analytical judgment.

4.4. AF Standards of Intelligence Analysis . The AF has established ten standards by which it measures and assesses analytic excellence and readiness. AF tradecraft standards align with IC standards; however, the AF incorporates two additional attributes: timeliness and customer engagement. AF standards also are in parallel with joint intelligence and GIISR guidance. These standards are used by the AF ISR Enterprise to conduct analysis operations and are integrated into AF Inspection System criteria. Attachment 4 contains a sample methodology and form to evaluate these standards. The following descriptions are excerpts from AFI 14-133. Refer to the AFI for additional details.

4.4.1. Timeliness. Analysis *must be timely* to impact planning, mission objectives, operations and otherwise aid in commanders' decisions. The aim is to deliver information and knowledge at the earliest time and place to enable customers to effectively make decisions and take action.

4.4.2. Appropriate Sourcing. Analysis *cites all sources used,* when feasible, and includes an *objective assessment of the quality, credibility, and reliability of the underlying sources*.

4.4.3. Accuracy. Analysis will *make the most accurate judgments and assessments possible*, based on the intelligence available and in light of known information gaps. A retrospective assessment of the accuracy of a judgment will help identify biases and other potential tradecraft errors for correction in future analysis.

4.4.4. Level of Confidence. To help qualify accuracy and to present analysis in a uniform and consistent manner across the AF, analysts will *indicate the degree of confidence/certainty* associated with analytic judgments and conclusions to the best of their ability, given currently available intelligence. AFI 14-133, Table 3.1, *Confidence Levels in Analytic Judgment*, provides guidance for analysts to use in assigning levels of confidence/certainty.

4.4.5. Assumptions vs. Judgments. Analysis *clearly distinguishes among underlying intelligence, analyst assumptions, and analyst judgments*.

4.4.6. Alternative Analysis. Analysis will *incorporate plausible alternative assessments,* judgments, or hypotheses, *particularly when major judgments contend with significant uncertainties, complexity, or a lack of available intelligence*, or when low probability events could produce high impact results. Whenever possible, analysis should be vetted through at least one other intelligence professional to minimize individual analyst bias.

4.4.7. Relevance. *Analysis is key to decision making*, warfighting, and acquisition efforts. Analysts should make every effort to ensure products and services fulfill the customer's intent and request, while also ensuring products and services are available to others for use beyond the original intent.

4.4.8. Logical Argumentation. Analysis will employ coherent and logical reasoning techniques, be supported by all key relevant information, and be internally consistent.

4.4.9. Utility. AF analytic products and services will *use formats* (written, verbal, visual, etc.) *that best enable understanding by the customer*. Intelligence analysis will be disseminated at the lowest classification and widest releasability levels without jeopardizing its usefulness to the customer.

4.4.10. Customer Engagement. Analysis should fully address customer requirements within time constraints and in a manner most useful. Analyst Airmen will be responsive to customer feedback. While challenging to evaluate, this tradecraft standard is foundational to AF intelligence analysis.

4.5. Beyond the Checklist . The list of analysis activities, tenets, and standards lend themselves to a checklist mentality. This is especially true with the standards, that are the criteria by which the AF evaluates analytical readiness. However, it is vital to remember that intelligence analysis is ***not just a science but also an art***. Following good tradecraft practices aids in developing a sound analytic process and foundation. However, the analyst cannot become paralyzed in making an assessment if all the tradecraft pieces do not fully align. Mistakes will be made – have been made – but we cannot fail to provide decision makers with our best assessment based on what information we had at the time. The analyst Airman learns the fundamentals but then spends many hours of intense effort honing and refining application of the fundamentals in the determined pursuit of excellence. Analysts need to express interest in the analysis activities and be eager to revisit any or all of them for the sake of providing more accurate, mission-relevant analysis for each customer requirement. Analysts need to embrace the

tenets and standards such that they become an intuitive and natural part of all analytical activities. Analysts, supervisors, and commanders also need to hold each other accountable to the tenets and standards.

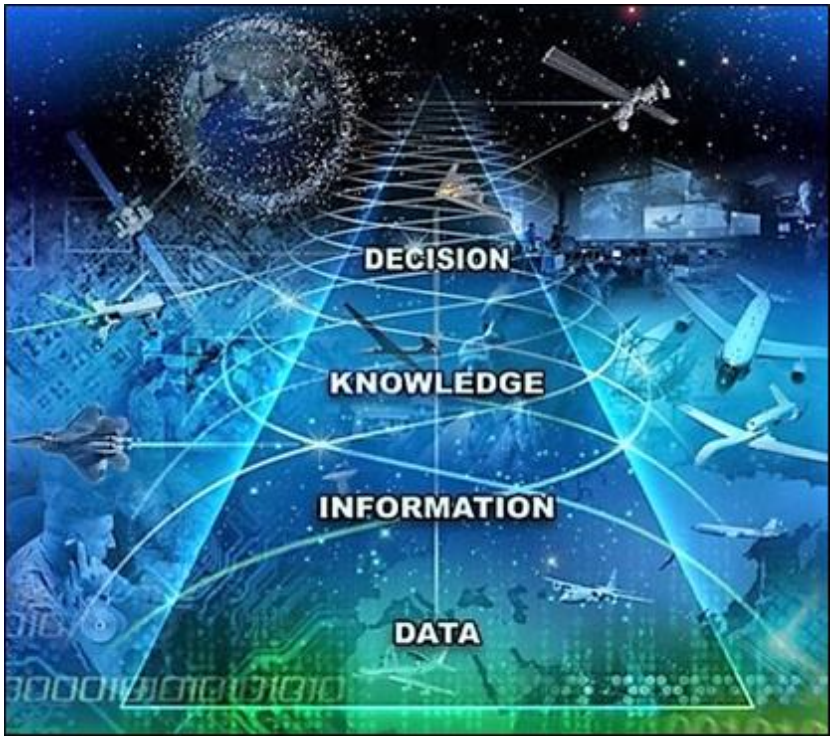
4.6. AF Analytic Ombuds . The AF Analytic Ombuds is the AF representative that responds to concerns raised by intelligence analysts about adherence to AF analysis tenets, standards, and production guidelines. The Ombuds addresses such concerns as lack of objectivity, bias, politicization, or other issues in applying analysis tenets and standards. The AF/A2 appoints the AF Analytic Ombuds in accordance with DNI guidance. In addition, NASIC and each MAJCOM/A2 designate an individual or office to serve as their organization's Analytic Ombuds IAW AFI 14-133.

Chapter 5

ANALYSIS SKILLS AND TRADECRAFT

5.1. Overview. Intelligence analysis is what transforms data into the information and knowledge necessary for warfighters and decision makers to decide and act (refer to Figure 5.1, *Transforming Data to Decisions*). While technology can assist and enable these transformations of data, without human cognition (people "in-the-loop") it is doomed to fail. There are things technology alone is not capable of. The things technology can do depend upon human analysts creating and updating the analytic models, databases, and displays that can be automated or made more efficient. The most basic and necessary unit in intelligence analysis is the analyst. **Note:** Attachment 7 identifies some online resources that contain additional information on analysis skills and tradecraft topics covered in this chapter.

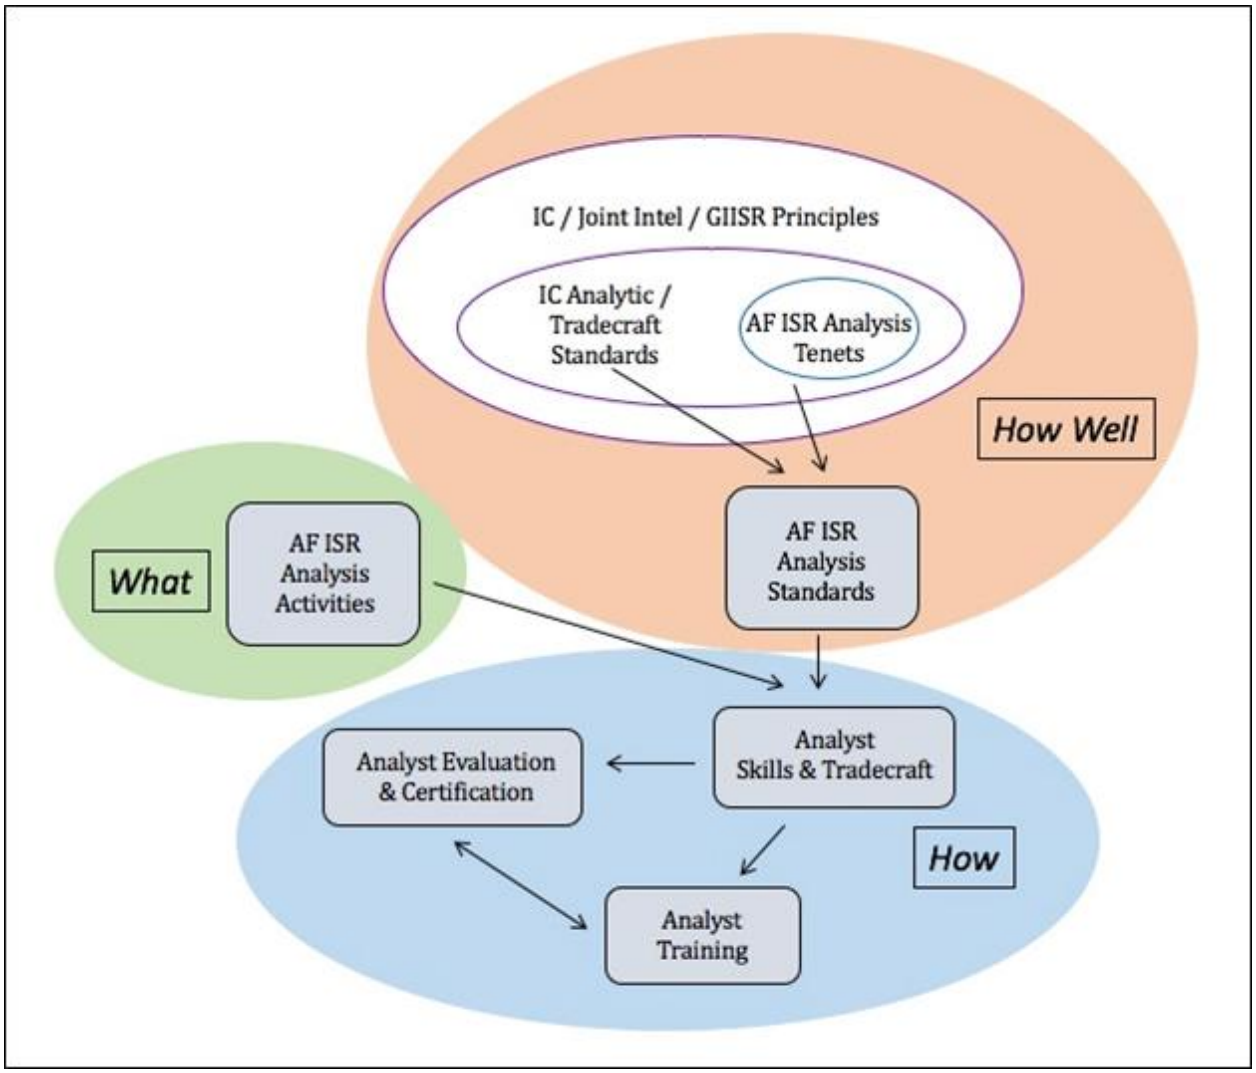
Figure 5.1. Transforming Data to Decisions.



5.1.1. Definitions and Relationships. An analysis skill is a specific ability or collection of capabilities required to competently conduct analysis that is acquired through training and/or experience. Analysis tradecraft is an established or prescribed analysis technique, practice, or systematic process. The relationship and role of intelligence analysis skills and tradecraft is illustrated in Figure 5.2, *Relationship and Role of Intelligence Analysis Skills and Tradecraft*. Whereas the five AF intelligence analysis activities (discovery, assessment, explanation, anticipation, and delivery) comprise "what" analyst Airmen do and analysis tenets/standards establish how well analysis is done, analysis skills and tradecraft are the "how" of analysis. Analysis activities, tenets, and standards drive the skills and tradecraft for which analyst Airmen need to be trained. In turn, analysis skills and tradecraft determine training, evaluation, and certification requirements. Analyst skills and tradecraft highlighted

in this publication are time-tested, repeatable, and proven effective for structured AF intelligence analysis.

Figure 5.2. Relationship and Role of Intelligence Analysis Skills and Tradecraft.



5.1.2. Analysis Transformation.

5.1.2.1. In 2004, Congress passed the Intelligence Reform and Terrorism Prevention Act (IRTPA) in response to several commissions and hearings in the aftermath of 9/11. That act is known for establishing the ODNI; however, the act also set forth a number of tasks and objectives for the DNI to accomplish to improve intelligence and prevent or mitigate the failures that led to 9/11. It is worth highlighting that a majority of those tasks and objectives relate to the conduct of intelligence analysis: Congress directed that U.S. intelligence analysis needed to be professionalized, have set standards, and address many shortcomings in skills and tradecraft through increased guidance and training. Thomas Fingar, the first Deputy DNI for Analysis, later reflected that up until IRTPA and the subsequent transformation of analysis in the IC, analysis had largely been a craft in the IC: skills learned only on-the-job, under the tutelage of 'journeymen' and 'masters,'

where the language and processes used could differ from shop to shop, region to region, and advancement was informally recognized and locally derived. **Note:** For more information on this topic, see Thomas Fingar, *Reducing Uncertainty: Intelligence Analysis and National Security*.

5.1.2.2. This is not to say that some agencies or elements in the IC did not have more established vocabulary and tradecraft, and even so-called training and intelligence colleges, such as the CIA and DIA. However, this kind of professional approach was not widespread, and where it was present, organizations were not sharing standards or efforts. IC standards began to promulgate through DNI-approved ICDs and other policy, while shared training and vocabulary were established through collaboration, development, and sharing of IC analysis training. As these directives, policy, and training matured, efforts began to focus on defining the fundamentals of intelligence analysis as a means to true certification of all analysts in the IC. Today, these analytic standards are not only reflected in ICDs, but are standards for AF compliance, as highlighted by AFI 14-133 and associated unit Management Internal Control Toolset (MICT) Self-Assessment Communicators (SACs).

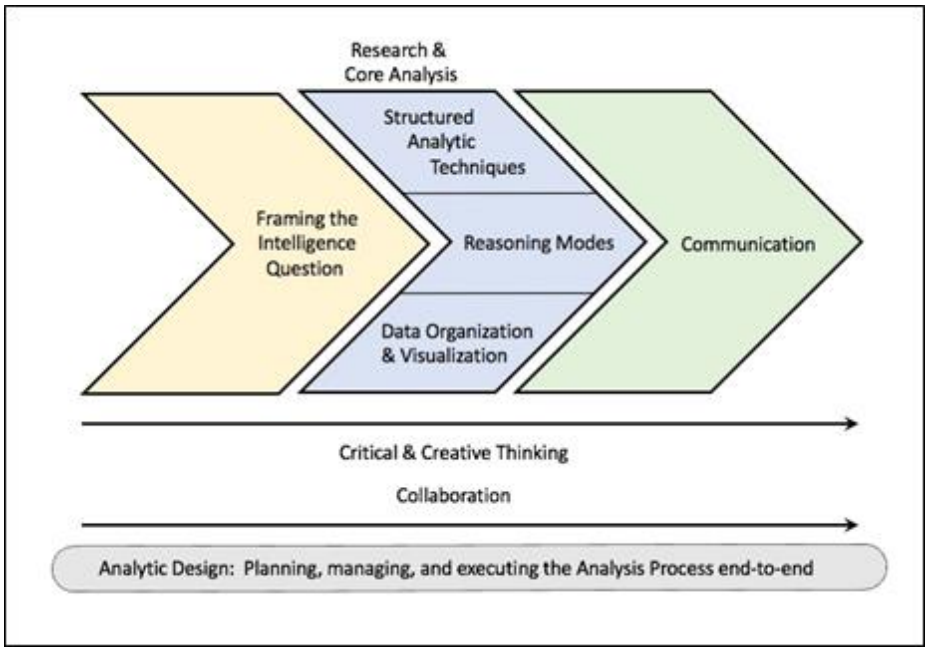
5.1.3. Analysis Certification Programs.

5.1.3.1. All-Source Analysis (ASA) Certification Program. The ASA Certification Program is a USD(I)-approved and DIA-led analysis qualification program for the DoD. The program assesses a candidate's knowledge and performance of ASA skills. The program is in the nascent stages. Initial qualification is focused on the fundamentals of intelligence analysis and open to all military and civilian intelligence analysts. The intent is for the program to expand to follow-on or higher levels of qualification. The AF ISR Force Management Division (AF/A2FD) is the AF OPR for the ASA Certification Program.

5.1.3.2. Other Certification Programs. The IC has also established certification programs for various fields of single-source analysis and activities closely linked with ASA. As one example, the Geospatial Intelligence (GEOINT) Certification Program is part of a broader USD(I) initiative to further professionalize the DoD intelligence workforce. The program applies to all cleared DoD civilian, military, and contractor practitioners in GEOINT-related work roles. Another example is the DoD Collection Management Certification Program, which ensures that collection managers possess the knowledge and skills associated with the competencies necessary to successfully carry out DoD collection management functional tasks.

5.2. Skills and Tradecraft Fundamentals. While analysis skills and tradecraft are taught in varying forms and emphasis across the IC and in AF entry and advanced training for core AF intelligence AFSCs (14N, 1NX, 9SX, 1A8X, and 0132), all AF intelligence analysts require competency in these areas. Figure 5.3, *Fundamental Skills and Tradecraft of the Analysis Process*, portrays the fundamental skills and tradecraft associated with the analysis process. Although the figure suggests an alignment, the order in which the analyst Airman applies the skills and tradecraft techniques varies depending on the requirement and is not as important as ensuring all skills and tradecraft are considered. This section will describe each of these areas.

Figure 5.3. Fundamental Skills and Tradecraft of the Analysis Process.



5.2.1. Critical and Creative Thinking.

5.2.1.1. Critical thinking is considered to be a foundational AF analysis skill. AFI 14-133 defines it as the intellectually disciplined process of actively and skillfully conceptualizing, applying, analyzing, synthesizing, and/or evaluating information gathered from or generated through observation, experience, reflection, reasoning, or communication, as a guide to belief and action. The concept of critical thinking and its associated improvements to coherent cognition arose from the philosophy departments of schools and universities in the mid-1990s. Many observers feel it was because managers and leaders across the private, commercial, and government worlds began demanding people who could "think better and deeper." **Note:** See Peter A. Facione, *Critical Thinking: What It is and Why it Counts*, p. 3. Critical thinking may be better understood by contrasting it with "normal" thinking. In everyday thinking, people often find themselves with a central thought but are distracted by other thoughts or topics as they occur either physically or mentally. They strive to get to a destination, but may wander and stall before reaching it, with little recognition of where they have been. In contrast, with critical thinking, conscious effort occurs to focus on a particular thought and additionally be "critical" (the origin of the phrase) or reflective and purposeful, using more rigorous reasoning. Reflective reasoning—thinking about how we think, or metacognition—is the key difference between normal and critical thinking.

5.2.1.2. The need for critical thinking in analysis is often paired with another adjective: "creative." Creativity has always been difficult to define, but in the context of intelligence analysis, the 9/11 Commission report abounds with calls for U.S. analysts to have more imagination: to be able to link disparate happenings and facts, to see a "bigger picture," to envision alternatives which are not spelled out. In rigorous thinking, creativity is often associated with "abductive" reasoning: the process of generating a novel hypothesis to explain given evidence that does not readily suggest a familiar

explanation. **Note:** See section 5.2.4 for additional information on reasoning. Creativity "characterizes the analyst's ability to come to a conclusion spontaneously, often without a sense of having consciously taken definable steps to get there. While the abduction process may not be easily defined or taught, it may be encouraged by providing analysts with a wide array of research material and experiences, and by supporting the expenditure of time and energy on creative thinking." **Note:** See Lisa Krizan, *Intelligence Essentials for Everyone*, pp. 31-32, and LCDR William G. Schmidlin, *Zen and the Art of Intelligence Analysis.*

5.2.1.3. Both critical and creative thinking are supported in intelligence analysis by the application of methods known as Structured Analytic Techniques (SATs) and an understanding of analytic reasoning and the role of biases, addressed below.

5.2.2. Framing the Intelligence Question. A well-framed intelligence question is the most important factor in assuring the overall quality of intelligence analysis, helping analysts to anticipate emerging trends and developments and focus efforts on addressing issues most relevant to consumers of intelligence. The question drives information discovery, the selection of analytic approaches and methods, and ultimately the analytic message conveyed to intelligence consumers. Successfully framing the intelligence question consists of clearly articulating the key intelligence issues and deconstructing the question to identify the primary factors to be considered in answering the question. A well-framed question also requires the analyst to have an adequate understanding of air/space/cyber power and the missions the analyst directly supports. Framing the question includes identifying intelligence gaps, understanding the information base, and knowing how to drive collection.

5.2.2.1. Intelligence Gaps. An intelligence gap is information that is needed to appropriately conduct intelligence analysis and help answer an intelligence question but is absent from reporting—what we know we don't know. Identifying gaps helps focus the research and collection required to close the gaps. Moreover, awareness of intelligence gaps aids analysts in properly conveying the resulting level of confidence associated with analytic judgments.

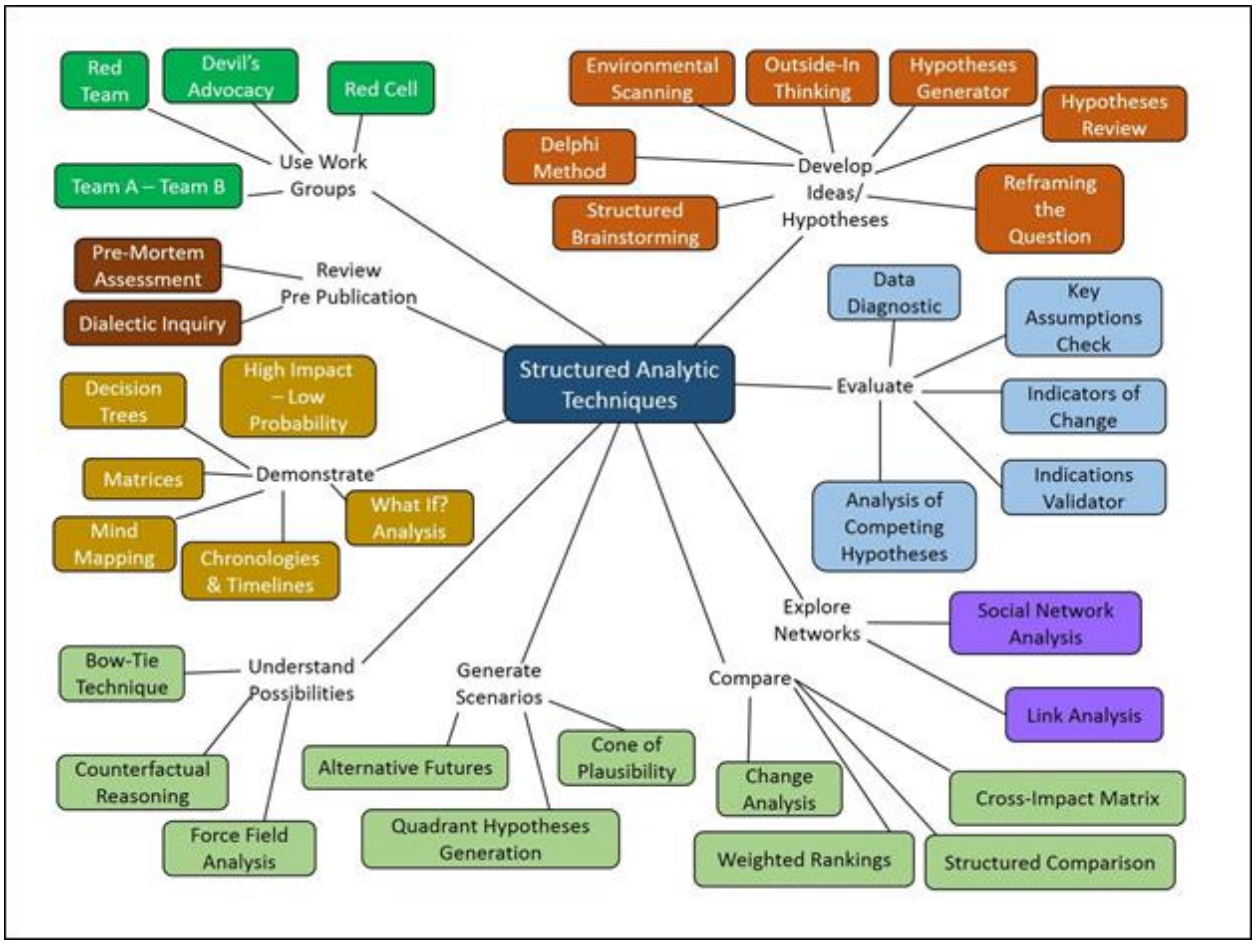
5.2.2.2. Understanding the Information Base. To effectively marshal information needed to answer intelligence questions, analysts require a solid understanding of the available information base. They need to identify what data and information is required, establish whether it is available, and determine where it can be found. In addition, they know the strengths and weaknesses of potential sources of information, are able to assess the quality of that information, in part by knowing where it comes from and how it was processed and disseminated, and understand the role analysis plays in transforming this data and information into knowledge that provides value to intelligence consumers.

5.2.2.3. Driving Collection. Analyst Airmen need to understand how information is collected and processed in the AF and more broadly in the IC to identify which sources of information are most useful in answering their intelligence questions, to assess quality and credibility, and to task collectors to collect information to fill intelligence gaps.

5.2.3. Structured Analytic Techniques (SATs). After properly framing the intelligence question, the analyst dives into the heart of the analysis process. There are several critical skills associated with this core research and analysis phase of the process, one being the application of SATs.

5.2.3.1. In *Structured Analytic Techniques For Intelligence Analysis*, Richards J. Heuer, Jr. and Randolf H. Pherson describe structured analysis as "a step-by-step process that externalizes an individual analyst's thinking in a manner that makes it readily apparent to others, thereby enabling it to be shared, built on, and critiqued by others. When combined with the intuitive judgment of subject matter experts, such a structured and transparent process can significantly reduce the risk of analytic error." **Note**: See Richards J. Heuer, Jr. and Randolf H. Pherson, *Structured Analytic Techniques For Intelligence Analysis*, p. xvi. SATs rose to prominence in intelligence analysis as part of a broad effort to transform the tradecraft following 9/11. Most SATs are not unique to intelligence analysis, but have been developed in other fields that utilize analysis. Many of these techniques, shown in Figure 5.4, *SATs*, broadly fall under the field of operations research, management tools, and general decision-making aids.

Figure 5.4. SATs.



5.2.3.2. Why are SATs important? Their application helps the analyst take a systematic approach to problem solving, mitigate bias and error, and enhance analytic credibility. SATs are useful by both individuals and teams in breaking down problems or "decomposition," generating ideas or "brainstorming," testing ideas or reviewing alternatives, and checking solutions or assessments. Structured techniques offer an effective means of applying scientific methodologies to the operational art of analysis.

Advanced analytic courses, such the AF Critical Thinking and Structured Analysis Course (CTSAC), offer focused training on SATs. Attachment 5 contains a tradecraft guide that details some of the key SATs commonly used by analyst Airmen.

5.2.4. Analytic Reasoning and Bias.

5.2.4.1. The heart of the definition for critical thinking is purposeful, reflective reasoning. Logical reasoning is defined as the process of establishing a justified belief by using premises (rules), evidence (facts), and argument (relationships). Three types of basic reasoning include:

5.2.4.1.1. Deductive reasoning—Sometimes called deductive logic, deduction is reasoning in which a conclusion is a logical consequence of the premise. A deduction moves from general rules and some evidence to particular cases.

5.2.4.1.2. Inductive reasoning—The intellectual process of drawing generalizations on the basis of observations or other evidence. Induction takes place when one learns from experience.

5.2.4.1.3. Abductive reasoning—The process of generating a novel hypothesis to explain given evidence that does not readily suggest a familiar explanation. Abductive reasoning starts from a set of accepted facts and creatively proposes their best explanation.

5.2.4.2. More recently, social scientists have helped to expand the horizons and suggest there are analytical *modes* of reasoning, most of which are familiar in description yet have significant research behind them. Reasoning is the process of forming conclusions, judgments, facts, opinions, or inferences. Reasoning assists in forming arguments based upon evidence about observed activities. It is the job of an analyst Airmen to make sense of a complicated mass of information—to understand and explain the current situation, to reconstruct the past that led to it, and to use it as the basis of predictions for the future. **Note:** See Barbara Spellman, "Individual Reasoning*"* in *Intelligence Analysis: Behavioral and Social Scientific Foundations*, p. 117. As human beings with developed intellects, we generally may be said to have six modes of reasoning:

5.2.4.2.1. Status Quo—Making immediate judgments and inferences.

5.2.4.2.2. Authoritative—Drawing inferences from expert testimony or strong belief.

5.2.4.2.3. Comparative—Drawing conclusions from examples, cases, or analogies.

5.2.4.2.4. Empirical—Drawing conclusions from personal interaction with real evidence.

5.2.4.2.5. Scientific—Drawing casual inferences using facts, premises, and logic.

5.2.4.2.6. Market—Drawing conclusions from a structured consensus of persons.

5.2.4.3. We use many of these modes of reasoning every day, and there are analytical equivalents used in the process and mission of intelligence. However, bias remains one of the most common detractors in applying the modes of reasoning. Cognitive biases are mental errors caused by our simplified information processing strategies. When people reason, they employ various simplifying strategies and rules of thumb to ease the burden of mentally processing information to make judgments and decisions. "I always get

enchiladas at Mexican restaurants; the interstate is always faster; or I always get my news from an online news source." These simple rules of thumb may be acceptable for surviving the daily grind, but not for performing intelligence analysis. Analysts have to remain detached from normal survival biases and start fresh with each new problem.

5.2.4.4. Common types of cognitive biases include:

5.2.4.4.1. Bandwagon Effect—Tendency to believe something because many others believe it.

5.2.4.4.2. Clustering Illusion—Tendency to overvalue small runs, streaks, or clusters in large sets of data.

5.2.4.4.3. Confirmation Bias—Tendency to overvalue data supporting initial assumptions or expectations, and undervalue that which contradict.

5.2.4.4.4. Framing Effect—Tendency to draw different conclusions from the same data if it is presented differently.

5.2.4.4.5. Illusory Correlation—Belief that two events are related when they might not be.

5.2.4.4.6. Insensitivity to Sample Size—Tendency to underestimate the variation in data from small samples.

5.2.4.4.7. Mirror Imaging— Assumption that others see events and react to them just as we do.

5.2.5. Data Organization, Visualization, and Analytic Modeling.

5.2.5.1. As analyst Airmen begin to acquire information related to their intelligence question, either as part of a focused research effort or routine monitoring within their areas of responsibility, they need to employ a systematic approach to triaging and organizing information to identify trends, patterns, and relationships relevant to their intelligence question. The use of visualization techniques can assist analysts in deriving meaning from large volumes of fragmented information.

5.2.5.2. Visualization and analytic modeling are companion concepts to SATs. Effective visualization helps the analyst Airman analyze and reason about data and evidence. Analytic models can often help capture and expose knowledge, focus collection on the right needs, and apply analytics to the right questions. Visualization and analytic modeling apply to both the analytic process itself, and the delivery of information to consumers. Their importance was a key factor in establishing the analytic tradecraft standards of "effective visual information" by the IC and "utility" by the AF.

5.2.5.3. Like analysis, visualization and analytic modeling are both art and science. The advent of big data and data analytics has begun to emphasize the science and created the field known as data science. Data scientists find, interpret, and merge rich data sources; ensure consistency of data sets; create visualizations to aid in understanding data; build mathematical models using the data; and present and communicate data insights and findings to specialists, scientists and non-technical audiences.

5.2.6. Communication. Effective communication is essential to the craft of intelligence and even the best intelligence analysis falls short if communicated poorly. Consumers often

judge the validity of analysis by the quality of how it is communicated. The importance of communication is underscored by ICDs 203, 206, and 208 and AFI 14-133, which prescribe standards and principles for dissemination and require annual assessments for compliance. Analysts use multiple vehicles and formats to communicate their assessments to consumers.

5.2.6.1. Analytic Writing. Well-written products share a common set of attributes. First and foremost, good intelligence writing is analytic. That means, it does not simply report events; it explains the significance of those events and much more. Intelligence assessments are structured so that busy consumers can quickly grasp the main message and underlying reasoning, and be clear, precise, and convincing. In particular, analysts minimize the chance for misinterpretation of the findings, the certainty behind them, or how they were arrived at. Even the best analysis, if presented poorly, could cause the customer to question its credibility.

5.2.6.2. Visuals. Whereas data visualization during core research and analysis helps the analyst to "discover" the story, visualization for presentation helps "tell" the story. Visual presentation uses graphics—from charts and graphs to maps and complex tables, and both hardcopy and digital—to make relationships between data more easily understood.

5.2.6.3. Briefings. Briefings are a key mechanism for communicating analytic judgments to customers and can foster two-way communications to ensure that customer intelligence questions are addressed. Effective briefings consist of a well-organized, clear message relevant to the target audience; appropriate, tailored visual aids to reinforce the message; and a presentational style that keeps the audience focused on the message. Briefing is a skill that is honed through practice.

5.2.6.4. Multimedia Products. Significant innovations in multimedia tools have emerged that make possible sophisticated products that go beyond static graphical presentations. Multimedia products are generally either interactive or use full-motion video or animated web graphics to display content. Some techniques are particularly useful for depicting changes in data over time or comparing complex or multivariate data by allowing users to choose which variable they want to see. Despite these different ways to communicate analysis, the fundamentals remain the same: analysts need to present their analysis with clarity and sound logic.

5.2.7. Collaboration.

5.2.7.1. Similar to critical and creative thinking, collaboration is a skill that extends across the entire analysis process. Effective intelligence analysis depends on strong interpersonal relationships among analysts within and across intelligence agencies and the way the analysts relate to collectors, customers, and other experts within and outside the IC. Analysts are expected to collaborate and team to tackle complex intelligence questions, coordinate analytic products, and engage in regular discussions with colleagues that explore and challenge analytic judgements and prevailing assumptions. As one of the six AF intelligence analysis tenets, collaboration is considered a fundamental attribute and priority in AF analysis. Further, collaboration is the catalyst to every IC member's responsibility to "provide, discover, and request" as mandated in ICD 501.

5.2.7.2. An important aspect of collaboration and teaming is analytic outreach, which ICD 501 defines as the open, overt, and deliberate act of an IC analyst engaging with an individual outside the IC to explore ideas and alternate perspectives, gain new insights, generate new knowledge, or obtain new information. Outside experts include those in academics, business, non-governmental organizations, scientists, and others. Various methods of analytic outreach include conferences, seminars, exchanges, sabbaticals, and the building of trusted professional relationships.

5.2.7.3. Skills required for effective collaboration include employing tools to facilitate scheduling, access to data, and the sharing of analysis; effective team management practices; social networking techniques; constructive criticism—both giving and receiving; and interpersonal skills. Analysts need to also be aware of and take measures to avoid impediments to teaming, especially the "What's in it for me?" mindset. A study of the collaboration environment in the IC in 2007 identified six imperatives to help overcome such mindsets: mission criticality, mutual benefit, mutual trust, common understanding through common lexicon and transparent rules of the road, access and agility to identify collaborators and form collaborative communities, and incentives. **Note:** Derived from Integrated Concepts Development Office, *Achieving a Robust Collaborative Environment*.

5.2.8. Analytic Design. Analytic design is the activity of planning, managing, and executing the analysis process end-to-end—from the development of the right intelligence question, research, and core analysis to the crafting of an assessment that captures and communicates analytic insight for customers. Although analytic design is described last in this chapter's list of skills and tradecraft, it takes place up-front and then continues throughout the analysis process. In analytic design, the analyst outlines the plan for framing the question, applying SATs, reasoning and mitigating biases, organizing and visualizing data, communicating the analysis, collaborating with all applicable entities, and employing critical and creative thinking skills. Then, as the plan is put into action, the analyst revisits and revises the plan, as needed, to comprehensively address the requirement. More information on this subject is available at the following site: *ICAT-G/Products Analytic Design Portal*, Joint Worldwide Intelligence Communications System (JWICS) Caution-url: **https://intellipedia.intelink.ic.gov/wiki/Portal:IC_Analytic_Tradecraft_Gateway/Analytic_Design**.

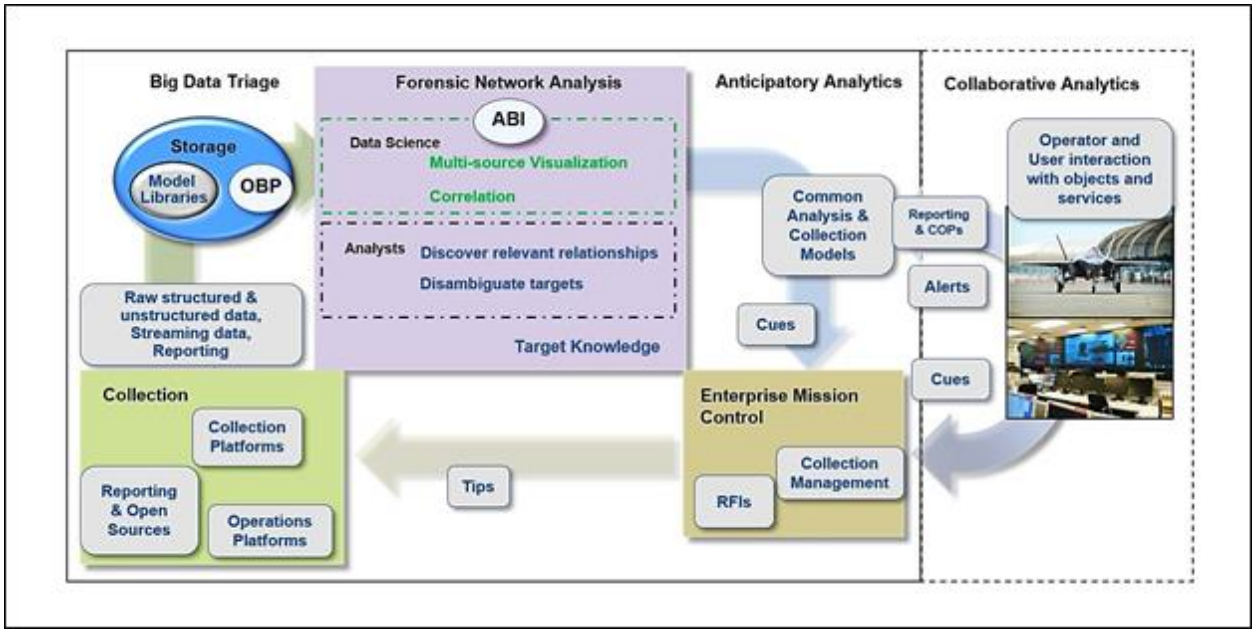
5.3. Key Analysis Concepts.

5.3.1. Big Data, Data Analytics and Data Science.

5.3.1.1. According to the *AF Future Operating Concept: A View of the AF in 2035*, the term big data describes large volumes of high-velocity, complex, variable data that require advanced techniques and technologies to enable the capture, conditioning, reliability, storage, distribution, management, and analysis of the information. The significance of big data extends beyond the sheer volume, complexity, and diversity of data; it is profoundly changing the way we think about data and creates new knowledge and information. **Note**: Paul B. Symon and Arzan Tarapore, "Defense Intelligence Analysis in the Age of Big Data," *Joint Forces Quarterly*, p. 4. Big data is driving us from a perspective of "causation" to one of "correlation." Rather than the traditional perspective of analyzing discrete amounts of data to understand the past cause and effect

(the why) and use that as a predictor of future behavior, data analytics enables analysts to harness the massive amounts of data available to draw correlations and use patterns of life (the what) as a predictor of future behavior, even if we do not understand "the why." **Note**: Kenneth Neil Cukier and Viktor Mayer-Schoenberger, "The Rise of Big Data: How It's Changing the Way We Think about the World," *Foreign Affairs*. Figure 5.5, *Data Analytics Framework*, depicts a general framework for data analytics.

Figure 5.5. Data Analytics Framework.



5.3.1.2. Data Science is at the heart of adapting the AF ISR Enterprise to the evolving big data environment. It can generally be described as the practice of exploiting and deriving valuable insights from data. This involves extracting knowledge from data sets that may be small, large, structured, multi-modal, multi-lingual, semi-structured or unstructured. Since data science is an inherently technical and specialized field, it is best performed by individuals trained and qualified in the complex and specialized nature of the work. As the DCS for ISR White Paper, *Data Science and the USAF ISR Enterprise* conveys, rather than train analyst Airmen to be data scientists, the AF approach is to develop a force of ISR professionals, operators, and knowledge managers that understand and leverage the capabilities that data scientists bring to the fight. Figure 5.5 highlights the role of data science relative to analysts in the process of data analytics.

5.3.1.3. The implications of big data, data analytics, and data science for intelligence analysis cannot be overstated. In recognition of this, the IC has embarked on a number of analytic modernization initiatives to exploit emergent big data capabilities, improve intelligence integration, and accelerate intelligence decision cycles. Two major initiatives are object-based production (OBP) and activity-based intelligence (ABI).

5.3.2. Object-Based Production (OBP).

5.3.2.1. Traditionally, analysts spend a great deal of time and effort assembling, collating, and parsing diverse data sources that pertain to a given intelligence problem.

As Figure 5.5 illustrates, OBP is a framework for organizing and sharing information. It is defined as the act of organizing intelligence around objects of interest—not by collection or data type—which allows users to aggregate intelligence information from across multiple intelligence domains and associate it with particular objects of interest. All intelligence that relates to something that physically exists in the real world is assembled and made centrally available as an object that all collectors, producers, and consumers can access. Objects include physical things (e.g., ships, buildings, vehicles, persons, and political boundaries), as well as abstract things (e.g., events and issues). The intent of OBP is to provide a consolidated perspective about the behavior of objects and their interaction with one another.

5.3.2.2. Traditionally, the output of each intelligence discipline is assembled by an analyst in order to understand the who/what/where/when of the object. The OBP alternative enables analysis to be directly attached to the object in question to allow delivery of complete find, fix, and track information direct to operational users. Thus, intelligence analysis is not stove-piped or the end result of a linear process. Instead, in this synthetic model, known information is dynamically assembled within the intelligence process. Automatic exploitation systems and manual intelligence analysis work in tandem to dynamically populate a shared community of objects that all analysts have access to. The result is that analysts can better understand intelligence activity by more clearly identifying and managing intelligence gaps and spending less time assembling information.

5.3.3. Activity-Based Intelligence (ABI).

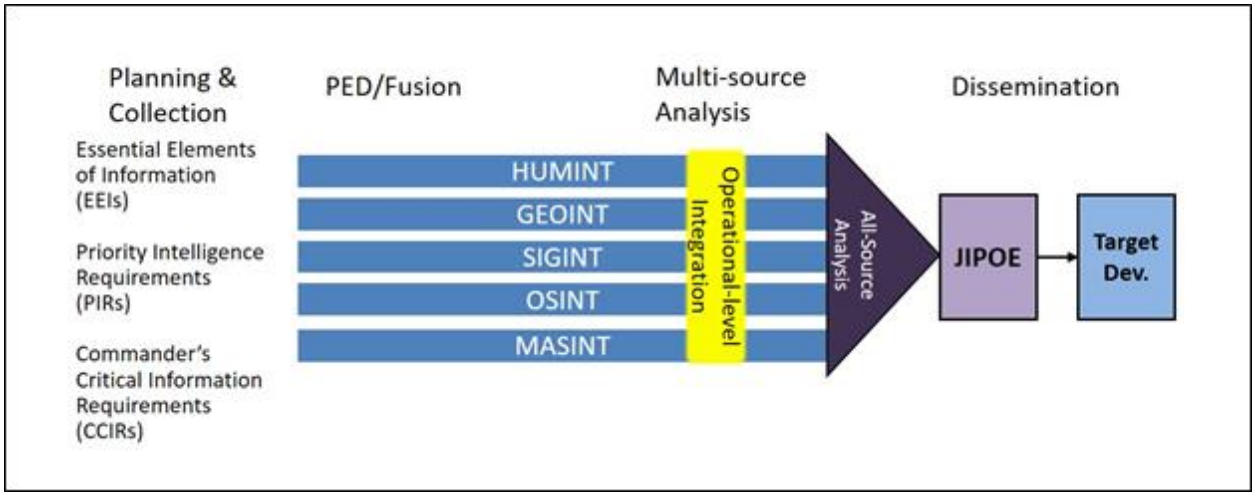
5.3.3.1. ABI emerged from the experiences of analysts working dynamic targets and analytic problems. It centers on the discovery and association of unknown activities. DIA, the National Geospatial-Intelligence Agency (NGA), and the National Security Agency (NSA) describe ABI as an analytic method applied to structured data from all sources, to discover objects (e.g., high-value target location), relationships (e.g., supplier/consumer), or behaviors (e.g., pattern of life) by resolving significant activity.

5.3.3.2. NGA has delineated four ABI tenants that apply to a variety of missions and problem-sets: 1) geo-reference to discover; 2) integration before exploitation; 3) data neutrality; and 4) sequence neutrality. As geo-referenced activity becomes the starting point of discovery, that allows for the rapid integration of multi-INT data and allows for analysis without data-source or sequence biases presented by the traditional linear collection process. Successful ABI analysis relies heavily on geo-referenced data that did not lend itself to an immediate application when it was collected, but eventually enhanced the larger context or provided more accurate characterization and understanding of data collected at a later date.

5.3.3.3. As ABI and OBP have grown to become IC-wide methodologies, NGA has advocated and developed a concept called Structured Observation Management (SOM). SOM is the practice and method of organizing and sharing multi-sensor data that is not focused on objects (e.g., activities or events), in order for the resulting data to be consistent with, and in support of, both ABI and OBP processes. It can be thought of as a 'bridge' between the new analytic processes of OBP and ABI.

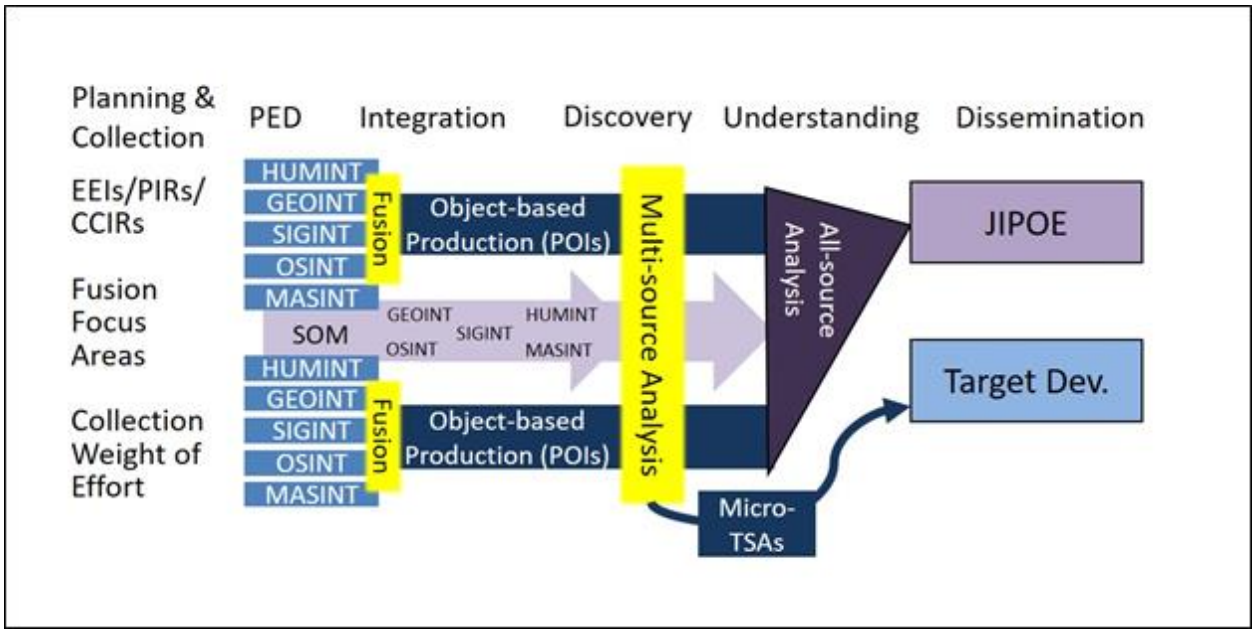
5.3.3.4. AF ISR analysts need to innovate to implement ABI in our mission sets. One such effort is Scoped Activity-based Intelligence for Nodal Targeting (SAINT), an ACC-developed capability that operationalizes ABI, predominantly in support of deliberate targeting. SAINT's strength lies in the rapid fusion of data and information to create multi-source intelligence as early in the intelligence cycle as possible, and close to the point of collection in order to enable collection refinement. Figure 5.6, *Traditional Model for Target Discovery*, depicts the traditional model of a linear production chain that combines to contribute to content-dominant analysis, a time-consuming approach to Joint Intelligence Preparation of the Operational Environment (JIPOE) and ultimately target development. In contrast, Figure 5.7, *ABI/OBP Integrated Model for Target Discovery*, highlights the SAINT construct, in which OBP enables fusion analysis and micro-target system analyses (TSAs) in a time-dominant environment. This model makes possible a symbiotic analysis/collections relationship to support strategic, operational, and tactical objectives simultaneously.

Figure 5.6. Traditional Model for Target Discovery.



Note: Source is Michael Kreuzer and Denis Dallaire, *Targeting the Islamic State: Activity-based Intelligence Empowering Air Force Targeting*.

Figure 5.7. ABI/OBP Integrated Model for Target Discovery.



Note: Source is Michael Kreuzer and Denis Dallaire, *Targeting the Islamic State: Activity-based Intelligence Empowering Air Force Targeting*.

5.4. Additional Tradecraft Resources.

5.4.1. IC Analytic Tradecraft Gateway (ICAT-G). The ICAT-G serves as a repository for the ICs collective knowledge of the analytic process, methods and techniques, and best practices. It is a useful, comprehensive reference aid for analysts and a valuable resource for analytic training. It is located on JWICS at Caution-url: **https://intellipedia/intelink.ic.gov/wiki/ICAT-G**.

5.4.2. Online Critical Thinking and Analysis Environment (OCTANE). OCTANE is a 25 AF online initiative for analysts to find mentors and exchange information through an analyst mentor network, practice tradecraft, compete with peers through IntelTrivia, and download free applications and games for use on mobile devices. The OCTANE site is on the Nonsecure Internet Protocol Router Network (NIPRNet) at **https://www.25afoctane.com**.

5.4.3. Center for Marine Expeditionary Intelligence Knowledge (CMEIK). The CMEIK is dedicated to advancing analytic tradecraft across the Marine Corps intelligence enterprise. The CMEIK offers courses, tradecraft notes, and video podcasts on a variety of analysis topics that are applicable to all military services. Several examples include a writing guide, SAT pocket guide, intelligence preparation of the battlespace template, and a collaboration page. CMEIK information is available on the SECRET Internet Protocol Router Network (SIPRNet) at Caution-url: **www.mcia.usmc.smil.mil/cmeik**.

Chapter 6

REQUIREMENTS AND PRODUCTION

6.1. Intelligence Requirements and Analytic Focus.

6.1.1. Questions, Requirements, and Customers.

6.1.1.1. Intelligence analysis and production are driven by leading questions or requirements for intelligence to fill a gap in knowledge or understanding of the environment, adversary capabilities, centers of gravity, or intentions. Questions may be more formal, such as Key Intelligence Questions (KIQs) from AF and IC Programs of Analysis (PoAs), or more informal, such as those that stem from direct, near-term support to operations. All questions are based on an intelligence organization's relationship with its customer and an understanding of customer needs.

6.1.1.2. Intelligence analysis and production are also driven by priorities at all levels of command, from the President of the United States down to the tactical level of operations. At the national- and IC-level, this primarily manifests itself in the National Intelligence Priorities Framework (NIPF).

6.1.2. National Intelligence Priorities Framework (NIPF**)**. Published annually and reviewed quarterly, the NIPF is the primary mechanism to establish, manage, and communicate national intelligence priorities. Guidance from the President and National Security Advisor determines overall priorities. Secretaries and cabinet-level heads of departments and agencies provide formal input to NIPF development. The DNI is responsible for developing and managing the NIPF. All IC activities, including those of the AF, adhere to the NIPF priorities. **Note:** See ICD 204, *National Intelligence Priorities Framework*, for NIPF policy and responsibilities.

6.1.3. Programs of Analysis (PoAs).

6.1.3.1. Per DNI direction, each IC member publishes an annual PoA to provide comprehensive analysis and production focus for their organization. Collectively, the IC PoAs offer a framework for collaboration with customers, stakeholders, and IC partners. The DNI has directed each IC organization to annually publish a PoA to provide comprehensive intelligence analysis and production focus for their organization.

6.1.3.2. The AF ISR PoA (AFISRPoA) is organized into broad, overarching analytic categories, each with multiple KIQs that represent the most pressing analysis required in each category. AF analysis organizations use these categories and KIQs to guide their analytic focus.

6.1.3.3. All PoAs are to reference NIPF priorities when possible. Additionally, a new DoD Integrated Defense Intelligence Priorities (IDIP) process is being implemented to identify and describe intelligence priorities for the diverse set of DoD customers: policy, operations, and acquisition. The IDIP is the DoD intelligence inject into the NIPF and provides an additional layer of data with traceability to analytic stakeholders. Analysts reference both the NIPF and IDIP for understanding of analysis and production priorities, and reference these priorities, when feasible, in development of respective AF intelligence products and services. Additionally, the IDIP can be used by analysts to help

frame internal resource and planning discussions across the Planning, Programming, Budgeting, and Execution (PPBE) cycle.

6.1.3.4. AFI 14-134 directs development of the AFISRPoA and sub-echelon PoAs for NASIC, and the 363 ISRW via 25 AF and ACC. The intent is for every major AF ISR production element to eventually develop its own PoA to focus on analysis priorities and production. The desired end-state resulting from the AFISRPoA and subordinate level PoAs would be a more unified AF ISR analysis and production enterprise.

6.1.3.5. JWICS Intellipedia lists and provides access to all AF and IC PoAs. A listing of associated AF ISR and IC PoAs resides on JWICS Intellipedia at Caution-url: **https://intellipedia.intelink.ic.gov/wiki/Programs_of_Analysis**. Analysts reference and leverage KIQs that are specific to their analysis mission area, enabling them to work toward common AF and IC goals, improve efficiency through elimination of redundant analytic efforts, and expand their collaboration both within and outside the AF.

6.1.4. Across the AF, DoD, and IC, various terms are used when referring to an intelligence question and/or requirement, including request for information (RFI), request for support (RFS), intelligence need, intelligence requirement, KIQ, and production requirement (PR). Henceforth, this publication will use RFI to refer to all types of intelligence questions and/or requirements. RFIs range from informal to formal and from verbal to formally documented requests. They originate from an intelligence customer (also called an intelligence consumer), which includes but is not limited to, operational units, acquisition organizations, national policy makers, other intelligence elements throughout the AF, DoD, and IC, and counterintelligence units, such as AFOSI. While RFIs may be explicitly stated, analysts anticipate and help shape RFIs, based on known mission needs and a thorough understanding of operations. Supervisors help ensure their analysts are able to engage with the customer, as needed.

6.1.5. Requirements deemed most important to mission accomplishment are identified as priority intelligence requirements (PIRs). By definition, these are the critical requirements that must be satisfied for a commander and staff to understand an adversary and the operational environment in order to successfully plan and conduct a mission. PIRs are general statements of intelligence need, such as, "What is the operational status of the adversary's integrated air defense system?" or "What terrorist groups are active within the area of interest?" PIRs provide the framework for prioritization of all GIISR operations within a CCMD. PIRs, combined with a commander's friendly force information requirements (FFIRs), constitute the commander's critical information requirements (CCIRs).

6.1.6. PIRs drive the development of detailed essential elements of information (EEIs). EEIs further define the commander's PIRs by outlining specific information requirements, such as, "What is the current location of the adversary SA-20 battalion?" The designation of PIRs and EEIs help ensure efforts are focused on critical information needed to support warfighters.

6.1.7. Priority requirements in acquisition intelligence are identified as critical intelligence parameters (CIPs). A CIP is a factor that defines the threshold at which the performance of a foreign system/capability would likely degrade or nullify the effectiveness of an acquisition program or details of a developmental U.S. system, the disclosure of which could allow an

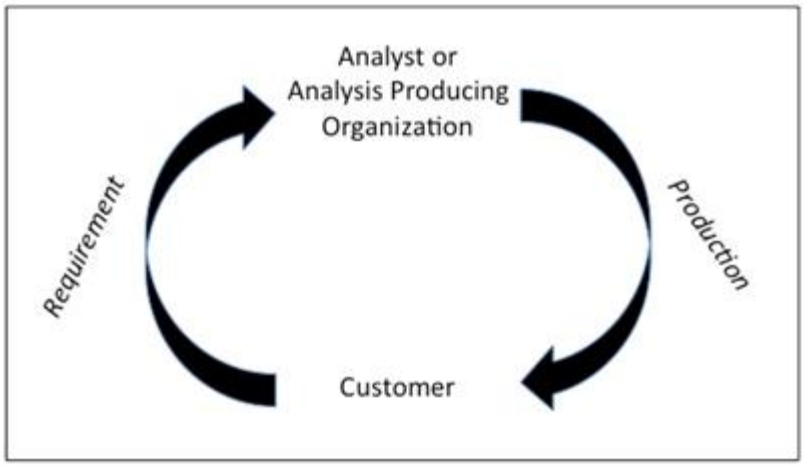
adversary to effect countermeasures to degrade mission effectiveness of the system, if it were to be fielded. CIPs are a key concept for an operational MAJCOM's requirements process/documents, as well as for an acquisition program. They are essentially a PIR for new capabilities going through the requirements and acquisition systems.

6.2. Intelligence Production .

6.2.1. Intelligence production is the development, tailoring, and presentation of intelligence knowledge via products and/or services that meet or address customer requirements. Production is an all-encompassing term that ranges from formal, published products on one end of the spectrum (e.g., a formal intelligence summary) to informal, impromptu updates on the other end (e.g., a location update on a tactical threat as a pilot steps to the aircraft). In some cases, analysts tailor existing intelligence to answer customer requirements. In other cases, analysts perform analysis on existing data, information, and intelligence to create new intelligence and knowledge. Still, in other cases analysts request collection of new data to consider in their analysis.

6.2.2. Ultimately, production culminates in at least one intelligence output for a customer, bringing the cycle full-circle, as depicted in Figure 6.1, *Requirement–Production Cycle*. An output may be an intelligence product or an intelligence service.

Figure 6.1. Requirement–Production Cycle.



6.2.3. An intelligence product is defined as tangible information in written, visual, digital, and/or verbal form that: 1) conveys information of intelligence value (e.g., written assessment, threat map, targeting materials, database, etc.); or 2) facilitates the accomplishment of an intelligence mission (e.g., assessment checklists, training folders, etc.). This definition is sufficiently broad to capture products that both directly and indirectly contribute to mission accomplishment, including those associated with intelligence analysis. The IC has established certain standards that products should meet. See Attachment 4 for a sample methodology and form to evaluate product standards.

6.2.4. An intelligence service is defined as assistance provided to another entity during the performance of ISR support, including: 1) the actual action of delivering or conveying intelligence to a user (e.g., presenting a briefing, tipping and cuing, collaboration, threat modeling, etc.); and 2) the process of enabling an ISR mission (e.g., exercise planning, skill

knowledge training, security clearance indoctrination, etc.). Some intelligence services result in additional intelligence products. Similar to intelligence products, this definition includes services associated with all categories of ISR mission accomplishment, one being intelligence analysis.

6.2.5. AF products and services are grouped into 14 product lines and 14 service lines. See Attachment 2 for descriptions of each product and service line.

6.3. Request for Information (RFI) and Analysis/Production Process . AFI 14-134 establishes and details the AF RFI and analysis/production process. Figure 6.2, *RFI and Analysis/Production Process*, illustrates the basic RFI flow that occurs at each organizational level. Figure 6.3, *RFI and Analysis/Production Process across the AFIAE*, depicts the flow across the whole analysis enterprise. The RFI and analysis/production process operationalizes the layered, distributed, mutually supporting AFIAE. It is the construct through which AF intelligence entities address customer requirements, share analytic findings, tap into analysis expertise across the IC, and collaborate on production. It is the mechanism that enables the AFIAE to achieve decision advantage. Refer to AFI 14-134, **Chapter 3** for specifics on the RFI process, categorization, tracking, and timelines.

Figure 6.2. RFI and Analysis/Production Process.

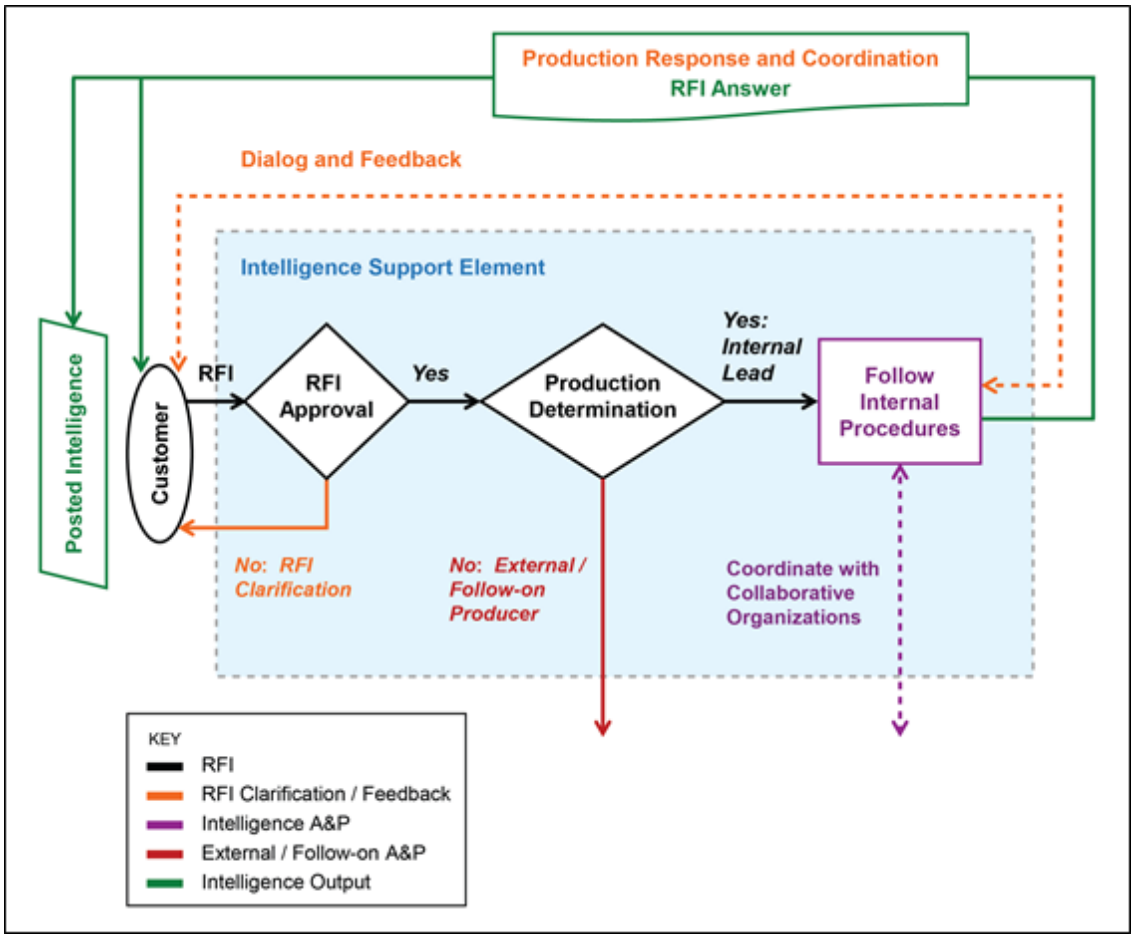


Figure 6.3. RFI and Analysis/Production Process across the AFIAE.

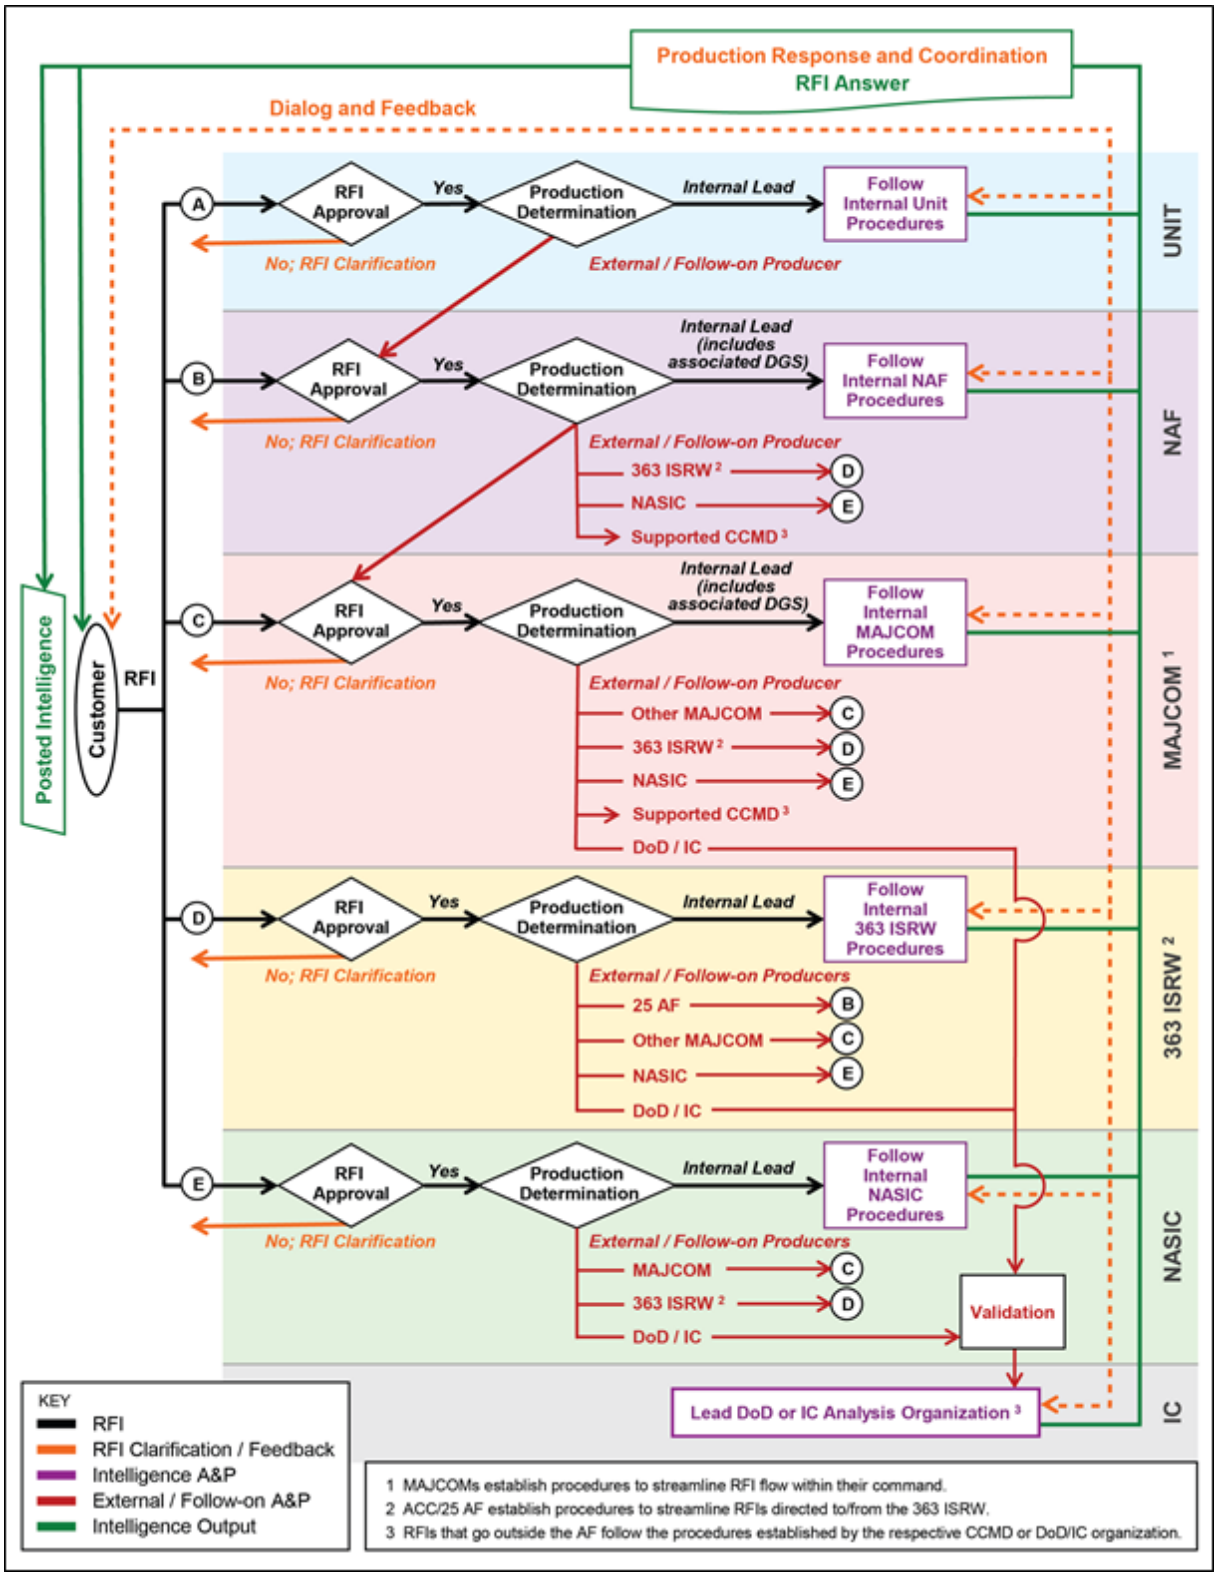

6.4. Acquisition Intelligence Production. Intelligence analysis and production are integral to the entire life cycle process of requirements definition, acquisition, and sustainment of weapon

systems. Acquisition customers require the production of specific threat assessments and potentially unique forms of data to support research, development, test and fielding of warfighting capabilities. Acquisition intelligence analysts support acquisition programs and initiatives by helping to identify and document intelligence dependencies (such as Intelligence Mission Data [IMD], modeling and simulation, etc.) that provide critical input to intelligence production efforts and the development of product/service requirements. As part of threat support to acquisition, NASIC and other service intelligence centers continually monitor and produce intelligence on adversary capabilities deemed critical to operational success for the developing capability. In partnership, acquisition intelligence specialists, operational command intelligence planners, and service intelligence center analysts provide direct support to acquisition decision processes, as defined in the *DIAP Users Guide* and DoD directives and instructions. These documents provide additional guidance for specific requirements and resourcing activities.

VERALINN JAMIESON, Lt Gen, USAF
Deputy Chief of Staff, Intelligence,
Surveillance, and Reconnaissance

Terms

Abductive Reasoning—The process of generating a novel hypothesis to explain given evidence that does not readily suggest a familiar explanation. Abductive reasoning starts from a set of accepted facts and creatively proposes their best explanation.

AF Intelligence Analysis Enterprise (AFIAE)—The global community of analyst Airmen and the AF ISR organizations that employ the core competency of intelligence analysis.

All-Source Analysis—Intelligence analysis that employs all available sources of data and information to enable the creation of new intelligence and knowledge.

Analysis Center—An organization with a predominant mission of all-source analysis. Analysis centers provide timely, accurate, and relevant intelligence analysis to support national and defense policymakers, warfighters, and the acquisition community.

Analysis Skill—A specific ability or collection of capabilities required to competently conduct analysis that is acquired through training and/or experience.

Analysis Tradecraft—An established or prescribed analysis technique, practice, or systematic process.

Analyst Airman—An AF ISR professional who is skilled and certified in tradecraft to perform the core competency of intelligence analysis.

Analytic Ombuds—Representative that is responsible for addressing organizational concerns regarding lack of objectivity, bias, politicization, or other concerns in the application of analysis and production standards.

Analytic Production Steward—Senior AF official designated to represent the analysis and production activities that their respective element is authorized to conduct, and to make determinations regarding the dissemination to or retrieval by authorized personnel of analysis produced by that activity.

Best Practice—A method or technique that has consistently shown results superior to those achieved with other means.

Big Data—A concept used to describe the explosion of available data as a result of the information environment.

Counterintelligence—Information gathered and activities conducted to identify, deceive, exploit, disrupt, or protect against espionage, other intelligence activities, sabotage, or assassinations conducted for or on behalf of foreign powers, organizations, or persons or their agents, or international terrorist organizations or activities.

Counterintelligence Analysis—The process of examining and evaluating information to determine the nature, function, interrelationships, personalities, and intent regarding the intelligence capabilities of a Foreign Intelligence Entity.

Covered Analytic Product—A subset of disseminated analytic products or services that is officially designated by the respective IC element as falling under the authority of ICD 206.

Critical Intelligence Parameter—A factor which clearly defines the threshold at which the performance of a foreign system/capability will likely compromise the program / mission effectiveness of the U.S. system.

Critical Thinking—The intellectually disciplined process of actively and skillfully conceptualizing, applying, analyzing, synthesizing, and/or evaluating information gathered from, or generated through observation, experience, reflection, reasoning, or communication, as a guide to belief and action.

Deductive Reasoning—Reasoning where a conclusion is a logical consequence of the premise. A deduction moves from general rules and some evidence to particular cases.

Defense Intelligence All-Source Analysis Enterprise (DIAAE)—The collective set of all DoD organizations that execute all-source analysis activities in production of defense intelligence.

Defense Intelligence All-Source Analysis Enterprise Board of Governors (DIAAE BOG)—A body comprised of representatives of the organizations of the DIAAE that provides a forum for issue identification and resolution; improving transparency and synchronization across the DIAAE; implementing DIAAE strategies and processes; providing support to the DoD Functional Manager for All-Source Analysis; and making resource recommendations based on changes to priorities and emerging requirements.

Essential Element of Information (EEI)—A specific information requirement that supports a more general Priority Intelligence Requirement (PIR).

Fusion Analysis (also called Time-Dominant Fusion)—Analysis in a time-sensitive environment in close proximity to the point of collection that entails quickly melding new information with baseline knowledge to meet a specific operational need. Emphasis is on the process of managing information and on timeliness over completeness.

Inductive Reasoning—The intellectual process of drawing generalizations on the basis of observations or other evidence. Induction takes place when one learns from experience.

Intelligence Analysis—A cognitive activity–both art and science–applying tools, processes, tradecraft, methods, and judgements to data and information to create and deliver new intelligence, insights, and knowledge, with the goal of providing a decision advantage to commanders and decision makers.

Intelligence Customer (also called Intelligence Consumer)—A requestor or user of intelligence, including an operational unit, an acquisition organization, a national policy maker, or an intelligence organization.

Intelligence Production—The development, tailoring, and presentation of intelligence knowledge via products and/or services that address customer requirements.

Intelligence Requirement—(also called Request for Information, Production Requirement, Request for Support, or Key Intelligence Question)—A need for intelligence to fill a gap in knowledge or understanding of the environment, adversary capabilities, centers of gravity, or intentions.

Intelligence Support Element—An AF intelligence organization at any echelon whose focus is on providing intelligence for AF planning, operation, or decisions.

ISR Activity—A task undertaken by a member of the ISR community that is associated with the accomplishment of an intelligence mission. An ISR Activity could result in one or more intelligence outputs. ISR Activities do not include tasks carried out by ISR personnel that are unrelated to a specific intelligence mission, such as security force augmentation, honor guard duty, professional military education, or physical training.

ISR Output—The result of an ISR Activity. An output is categorized as either an ISR product or an ISR service. Single or multiple outputs may derive from one activity, or one output could be derived from multiple Activities. All outputs relate directly or indirectly to the accomplishment of an intelligence mission.

ISR Product—A specific type of output from an ISR activity that consists of tangible information in written, visual, digital, and/or verbal form that conveys information of intelligence value (e.g., written assessment, threat map, and targeting materials) or facilitates the accomplishment of an intelligence mission (e.g., ISR program element code build, self-assessment checklist, or training folder).

ISR Service—A type of output from an ISR Activity. Assistance provided to another entity during the performance of an ISR mission: (1) the actual action of delivering or conveying intelligence to a user (e.g., presenting a briefing, tipping and cuing, collaboration, or threat modeling), or (2) the process of enabling an ISR mission (e.g., exercise planning, skill

knowledge training, or security clearance indoctrination). Some ISR Services result in additional ISR Products.

Key Intelligence Question—A strategic, high-level question that states the primary unknown, or information need, about an intelligence issue or problem, which subsequently drives intelligence analysis and/or production within an organization.

Lead/Designated Producer—The primary analysis and production organization responsible for integrating collaborative analysis with its own to provide a comprehensive and accurate intelligence product or service to a customer.

Lesson Learned—An observation that, when validated and resolved, results in an improvement in military operations or activities at the strategic, operational, or tactical level and in long-term, internalized change to an individual or an organization.

Multi-Source Analysis (also called Multi—INT Analysis)—Intelligence analysis that makes use of more than one source when access to additional potential sources is limited by reasons of timeliness, system access, location, or security levels.

Priority Intelligence Requirement (PIR)—A critical requirement that a commander and staff need to understand the adversary or operational environment to conduct the mission. A PIR is typically comprised of multiple, specific Essential Elements of Information (EEIs).

Production Response—An agreement between a lead/designated producer and a customer for the production of intelligence, containing sufficient detail to permit customer acceptance, rejection, or modification of the proposed intelligence output.

Service Intelligence Center—The analysis center designated for each military service. The AF has designated NASIC as the service intelligence center for the AF.

Single-Source Analysis (also called Exploitation)—Intelligence analysis that employs a single source or expertise in a functional area to characterize events, people, or things. Such analysis is limited to describing, rather than evaluating, the topic of a particular analysis due to restrictions inherent in single-source intelligence collection, precluding the ability to provide fully contextualized intelligence assessments.

Attachment 2

PRODUCT AND SERVICE LINES

A2.1. As Table A2.1, *Product and Service Line Categories*, illustrates, AF products and services are grouped into 14 product lines and 14 service lines, which can be further classified into four general categories: awareness; mission-specific; representation; and enabling. Sections A2.2 and A2.3 describe each product and service line.

Table A2.1. Product and Service Line Categories.

Category	Product Lines	Service Lines
Awareness	Intelligence Assessment Threat Study Intelligence Summary Intelligence Report Intelligence Alert	Analysis Situational Awareness Collaboration Intelligence Supportability Analysis
Mission Specific	Mission Document Targeting Document Requirement	Mission Operations Targeting Mission Readiness Operational Mission Training Requirements Management
Representation	Database Briefing Display Model	
Enabling	Policy, Plan or Program Mission Support Document	ISR Professional Training Policy, Planning, and Programming Force Management ISR Systems Security

Notes:
1. Some Product and Service Lines have similar labels. A good rule of thumb in distinguishing between them is that a Product Line is focused on a tangible output while a Service Line is focused on the action, process or function that results in the Product Line.
2. Product Lines include sanitized and releasable versions of products.
3. The scope, focus, and window of analysis decrease from Assessments to Alerts.
4. The Enabling category includes those products and services that indirectly contribute to substantive intelligence but, in and of themselves, do not have a primary purpose of

substantive intelligence.

A2.2. ISR Product Lines.

A2.2.1. **Intelligence Assessment** –Strategic, longer-term, analytical publication; focused on future capabilities and intentions; usually broad in military and/or political scope.

A2.2.2. **Threat Study** –Longer-term analysis that is more narrowly scoped than an assessment; usually focused on a threat system or category of threat systems; generally strategic or operational in scope.

A2.2.3. **Intelligence Summary** –Roll-up historical analysis of multiple events or missions; shorter timeframe than an assessment or a study (e.g., daily or weekly summary).

A2.2.4. **Intelligence Report** –Analysis from a single event or mission; includes results from a single-source intelligence collection; often associated with mission results; generally tactical or operational in scope.

A2.2.5. **Intelligence Alert** –High priority intelligence update with potential urgency and/or mission impact; usually focused on a singular threat or data point.

A2.2.6. **Database** –Systematically arranged collection of data, structured for convenient access and manipulation, generally in a computer.

A2.2.7. **Policy, Plan or Program** –Official ISR policy; guidance; plans; TTPs; research, development, test, and evaluation (RDT&E) efforts; agreements; and resourcing data, to include PPBE-related documentation.

A2.2.8. **Mission Document** –Text-based materials associated with conducting an ISR-specific mission or other air/space/cyber operational mission; does not include target materials.

A2.2.9. **Targeting Document** –Text-based analysis, reports, lists, or publications associated with targeting, weaponeering, or battle damage assessment (BDA); includes hard copy and soft copy formats; does not include target briefings or stand-alone target graphics.

A2.2.10. **Requirement** –A need for intelligence information, such as a request for information, a collection need, and essential mission information.

A2.2.11. **Mission Support Document** –Text-based materials that assist in the accomplishment of some enabling activities, such as training, exercises, conferences, security, and continuity.

A2.2.12. **Briefing** –Graphic-based presentation that is usually delivered verbally. Often times, a briefing is developed to visually summarize and verbally present the results of a text-based product (e.g., assessment, study, target document or mission support document). The most common form of a briefing is a Microsoft PowerPoint presentation.

A2.2.13. **Display** –Visual representation of analysis. Formats include maps, charts, videos, graphics, and diagrams. Displays are often incorporated into briefings or text-based products.

A2.2.14. **Model** –Physical representation of a threat or threat system or artificial representation of how a threat system will perform in actual operations.

A2.3. ISR Service Lines.

A2.3.1. **Analysis** –Services associated with the evaluation, interpretation, and often times integration of intelligence from available data sources and types. Includes the conduct of single-source, multi-source, and all-source analysis.

A2.3.2. **Mission Operations** –Services associated with the conduct of air/space/cyber operational missions, including ISR collection and processing, exploitation, and dissemination (PED) missions.

A2.3.3. **Situational Awareness** –Services provided to assist leadership and operators, including other ISR professionals, in comprehensively understanding the threat environment in which they are focused.

A2.3.4. **Intelligence Supportability Analysis** –The process by which intelligence, acquisition, and operations analysts identify, document and plan for requirements, needs, and supporting intelligence infrastructure necessary to successfully acquire and employ AF capabilities.

A2.3.5. **Targeting** –Services associated with the development of target materials, weaponeering, and BDA.

A2.3.6. **Mission Readiness** –Services that support the preparedness or capability of ISR or operational units to carry out their assigned missions.

A2.3.7. **ISR Professional Training** –Services involving the training and education of ISR personnel in ISR-related skills and tradecraft. Includes Mission Qualification Training (MQT) of ISR personnel.

A2.3.8. **Operational Mission Training** –Services associated with *threat-related* training of operational mission crews. Includes threat training for ISR personnel assigned to operational crews, such as cyber defense mission crews.

A2.3.9. **Requirements Management** –Services focused on managing ISR capability needs, requests for intelligence, and requests for assistance, forces, resources, or essential mission information.

A2.3.10. **Policy, Planning, and Programming** –Services involving the development of ISR policy, guidance, plans, TTPs, RDT&E efforts, agreements, and resource management, to include PPBE support.

A2.3.11. **Force Management** –Services associated with governing or guiding ISR manpower and personnel.

A2.3.12. **ISR Systems** –Services involving the establishment, accreditation, maintenance, and employment standards of ISR information technology systems.

A2.3.13. **Security** –Services associated with the protection, sanitization, and disclosure of classified information and with the establishment/maintenance of classified facilities.

A2.3.14. **Collaboration** –Services that explicitly facilitate the sharing of information both within and outside of the ISR community. While all Services involve "sharing information" to a certain extent, the Services in this Service Line are functions whose primary purpose is to share or exchange information.

Attachment 3

COMMON ANALYSIS LESSONS

A3.1. Table A3.1, *Common Analysis Lessons,* captures some of the general considerations broadly accepted across the AF ISR Enterprise and proven effective in improving analysis capabilities throughout time. Key sources for the lessons in this table include subject matter experts with extensive operational and tactical experience, various AF/A2 reviews of intelligence analysis, and a study by RAND Corporation. The table is organized by chapters in this handbook. The identification (ID) column refers to the AFH chapter associated with each lesson along with a unique alpha designator. To the right of the lessons are five columns that correspond to the five analysis activities: Discovery (DI), Assessment (AS), Explanation (EX), Anticipation (AN), and Delivery (DE). Those five columns indicate the primary (large, bold, upper-case X), secondary (standard, upper-case X), and tertiary (lower-case x) analysis activities associated with each lesson.

Table A3.1. Common Analysis Lessons.

ID	LESSON	ANALYSIS ACTIVITIES				
Chp 2	**AF Intelligence Analysis Enterprise (AFIAE)**	**DI**	**AS**	**EX**	**AN**	**DE**
2A	Increase your knowledge of different analytic and PED organizations to best understand AF ISR capabilities, enhance your network, and improve your tradecraft.	**X**	x	x		
2B	Be knowledgeable of air/space/cyber power strategy and theater objectives to help your assessment of developments.		**X**			
2C	Understand the larger context of the theater, problem set, or operation in which you are focused—applies to all analysts.	**X**				
2D	Check with area of responsibility (AOR) analysts to help collaborate your assessment of activities in that theater.		**X**			
2E	Coordinate with theater-specific and 363 ISRW targeteers for full understanding of your target and assessments.		**X**			
2F	Become familiar with different theaters to widen your expertise.			**X**		
2G	Continually balance timely notification to decision makers in support of operations against more in-depth and deliberate analysis/assessments.				**X**	
Chp 3	**IC and other Military Service Capabilities**	**DI**	**AS**	**EX**	**AN**	**DE**
3A	Gain Joint experience at a regional JIOC for improved & integrated analysis.			**X**	X	
3B	Seek out assignments in or deployments to an operational AOR to deepen and broaden your analysis expertise.			**X**	X	

3C	Be aware of U.S. military and theater capabilities and those of coalitions to enhance your analysis.			**X**		
3D	Prepare for future operations in a communications-contested environment; use/build resident capabilities prior to any deployment or operation.	x	x	x	**X**	x
3E	Enhance your Open-Source Intelligence (OSINT) expertise and understanding of IC-wide OSINT capabilities and organizations to leverage during crisis operations and to enhance your analytic prowess.	**X**				
3F	Improve your network with special operations ISR personnel for enhanced interface in-theater.		**X**	x	X	
Chp 5	**Analysis Skills and Tradecraft**	**DI**	**AS**	**EX**	**AN**	**DE**
5A	Leverage IC and joint programs that train, develop, and/or equip analysts to properly use tradecraft and provide better analysis.	x	x	**X**	X	x
5B	Participate in AF and Joint exercises to help sharpen analytic and joint awareness skills prior to an operational deployment.		x	**X**	X	
5C	Expand expertise and analytic skills beyond traditional warfare constructs to also be familiar with irregular warfare and non-traditional enemies.	**X**	x	x		
5D	Develop a network for improved collaboration/Red Teaming in different theaters.		x	**X**	X	
5E	Leverage theater and target-specific linguists as a good source to Red Team analysis, especially given adversary insights.		x	**X**	X	
5F	Leverage expertise and skills from multiple disciplines including scientists, engineers, space and cyber professionals, meteorologists, and the medical community for effective intelligence analysis.	x	x	**X**	X	
5G	Understand knowledge management, data science, and big data analytic concepts and principles for improved data aggregation.			**X**	X	
5H	Don't become influenced/infatuated with a particular sensor or source; cross-reference/check with multiple sources.	**X**				
Chp 6	**Analysis Requirements and Production**	**DI**	**AS**	**EX**	**AN**	**DE**
6A	Educate customers on AF ISR capabilities so they can help provide the best analysis possible to meet existing requirements.					**X**
6B	Understand what products are currently available and who is already working on/analyzing similar requirements to ensure unity of purpose and avoid duplication of effort.	**X**				
6C	Understand basic acquisition-/IMD-related intelligence requirements to help better align assessments in support		**X**			

	of respective customers.					
6D	Prepare now for the operations and warfare of tomorrow; expect contingency operations to occur in your area of analytic expertise and pre-plan against your analytic target with pre-positioned RFIs, target identification, etc.	x			**X**	
6E	Coordinate/interface often with resident collection managers on assessments and proposed collection strategies.	x	**X**		X	
6F	Enhance your ability to assess risks associated with commander estimates and plans (e.g., operational plans, contingency plans, etc.) for improved utility and interface with traditional operations.		**X**			
6G	Always consider the commander's intent, end state, definition of success, and the potential adversary centers of gravity when performing analysis.			x	**X**	
6H	Develop the analysis/assessment then take a final "step back" to review again from a strategic mindset and perspective.		x	**X**		
6I	Strive to produce assessments that are releasable and only make products/services “Not Releaseable to Foreign Nationals (NOFORN)” or caveated when required.					**X**

Notes:
1. The list is not intended to be comprehensive or all inclusive, nor is it intended to serve as a checklist that analyst Airmen are expected to meet. The aim is for analyst Airmen and analysis organizations across the AF to refine and expand the list over time.
2. Key sources for the lessons learned in this table include subject matter experts, various AF/A2 reviews of intelligence analysis, and a study by RAND Corporation: Brien Alkire, et al., *Leveraging the Past to Prepare for the Future of Air Force Intelligence Analysis*, RR-1330-AF.

A3.2. Some of the intelligence analysis lessons in Table A3.1 have been formally documented in some form or fashion via the AF Lessons Learned (LL) Program (AFLLP). The AFLLP exists to enhance readiness and improve combat capability by capitalizing on the experiences of Airmen and organizations. A lesson learned is an observation that, when validated and resolved, results in an improvement in military operations or activities at the strategic, operational, or tactical level and in long-term, internalized change to an individual or an organization. The AFLLP is part of the larger Joint Lessons Learned Program (JLLP). The Joint LL Information System (JLLIS) is used to track and disseminate LLs throughout the AF, DoD, and IC. JLLIS allows AF personnel to search, submit, and manage all AF Observations, Lessons Identified, After Action Reports, LLs, and other information up to TOP SECRET/Sensitive Compartmented Information (TS/SCI). The JLLIS database is located at SIPRNet Caution-url: **https://www.jllis.smil.mil**. All analyst Airmen are encouraged to register in JLLIS and enter observations that contain potential lessons into JLLIS for coordination through the AFLLP and/or inform their local chain of command as appropriate.

A3.3. In addition, several MAJCOMs actively acquire lessons learned or best practices. For example, HQ ACC/A2OO (Weapons and Tactics) has established a program to capture lessons learned, TTPs, and experience from ISR professionals returning from deployments.

Attachment 4

SAMPLE STANDARDS EVALUATION METHODOLOGY

A4.1. IAW AFI 14-133, MAJCOM/A2s and the NASIC/CC are responsible for developing a means to annually measure and assess AF intelligence analysis standards via SACs for reporting in the MICT. In addition, the DNI requires the AF to annually evaluate specified "covered products" for compliance with IC standards. Table A4.1, *IC Product Evaluation Criteria and Rating Scales*, delineates IC analytic tradecraft standards for use in assessment and "covered product" evaluations. The JWICS Advanced Global Intelligence Learning Environment (AGILE) offers computer-based training on how to conduct product evaluations. It is important to note that while AF tradecraft standards align with IC standards, the AF evaluates two additional standards: timeliness and customer engagement. Table A4.2, *Sample Tradecraft Criteria for Timeliness*, and Table A4.3, *Sample Tradecraft Criteria for Customer Engagement*, offer considerations for self-assessment on these two additional AF standards.

Table A4.1. IC Product Evaluation Criteria and Rating Scales.

Reviewer		Objective	1. Yes	2. No
Date of Review		Independent of political consideration	☐ Yes	☐ No
Product Name		Timely	☐ Yes	☐ No
Product ID Number		Based on all available sources of intelligence	☐ Yes	☐ No

1. Properly describes quality and credibility of underlying sources, data, and methodologies			
☐ Poor (0)	☐ Fair (1)	☐ Good (2)	☐ Excellent (3)
☐ Largely lacks sourcing or describes reporting base, data, or methodologies only vaguely; **OR** ☐ Misidentifies or misrepresents cited reporting, data, or methodologies.	☐ Contains basic, generic descriptions of cited reporting, data, or methodologies; **BUT** ☐ Provides little detail on factors that may affect the quality and credibility of underlying sources, data, or methodologies.	☐ Contains at least basic, generic descriptions of cited reporting, data, or methodologies; **AND** ☐ Provides considerable detail on factors that may affect the quality and credibility of underlying sources, data, or methodologies.	☐ Satisfies "good" criteria; **AND** 1. Identifies which sources are most important to major analytic judgments; **OR** ☐ Provides additional detail about sources, data, or methodologies that provides insight into their contribution to the analysis.
Comment:			

2. Properly expresses and explains uncertainties associated with major analytic judgments			
☐ Poor (0)	☐ Fair (1)	☐ Good (2)	☐ Excellent (3)
☐ Does not indicate levels of uncertainty associated with major analytic judgments; **OR** ☐ Indicates levels of uncertainty associated with major analytic judgments that are inconsistent with the basis ascribed to them.	☐ Indicates levels of uncertainty associated with major analytic judgments; **BUT** ☐ Does not explain their basis (e.g., by reference to strengths and weaknesses of the information base, contrary reporting, assumptions, or the nature of the judgment).	☐ Indicates levels of uncertainty associated with major analytic judgments; **AND** ☐ Explains their basis (e.g., by reference to strengths and weaknesses of the information base, contrary reporting, assumptions, or the nature of the judgment).	☐ Satisfies "good" criteria; **AND** **1.** Provides especially thorough discussion of nature and sources of uncertainties affecting major analytic judgments; **OR** ☐ Identifies indicators that, if detected, would alter levels of uncertainty associated with major analytic judgments.
Comment:			

3. Properly distinguishes between underlying intelligence information and analysts' assumptions and judgments			
☐ Poor (0)	☐ Fair (1)	☐ Good (2)	☐ Excellent (3)

☐ Does not distinguish among statements that convey underlying information, assumptions, and judgments.	☐ Sometimes distinguishes among statements that convey underlying information, assumptions, and judgments; **OR** ☐ Does not explicitly state assumptions that serve as linchpins of an argument or bridge key information gaps.	☐ Consistently distinguishes among statements that convey underlying information, assumptions, and judgments; **AND** ☐ Explicitly states assumptions that serve as linchpins of an argument or bridge key information gaps.	☐ Satisfies "good" criteria; **AND** 1. Identifies indicators that, if detected, could validate or refute judgments or assumptions; **OR** ☐ Explains the implications for judgments if assumptions are incorrect.
Comment:			
4. Incorporates alternative analysis			
☐ Poor (0)	☐ Fair (1)	☐ Good (2)	☐ Excellent (3)
☐ Does not present alternatives when uncertainties, complexity, or low probability / high impact situations warrant their inclusion.	☐ Presents alternatives when uncertainties, complexity, or low probability / high impact situations warrant their inclusion; **BUT** ☐ Does not explain the evidence and reasoning that underpin them or discuss their likelihood or implications related to U.S. interests.	☐ Presents alternatives when uncertainties, complexity, or low probability / high impact situations warrant their inclusion; **AND** ☐ Explains the evidence and reasoning that underpin them; **AND** ☐ (c) Discusses their likelihood or implications related to U.S. interests.	☐ Satisfies "good" criteria; **AND** ☐ Identifies indicators that, if detected, would affect the likelihood of any identified alternatives.
Comment:			
5. Demonstrates customer relevance and addresses implications			
☐ Poor (0)	☐ Fair (1)	☐ Good (2)	☐ Excellent (3)
☐ Provides little or no information or analysis beyond what is generally known; **OR** ☐ Does not respond adequately to a specific tasking.	☐ Provides useful information and analysis but does not address implications; **OR** ☐ Does not address an important issue or question raised by the analysis; **OR** ☐ Satisfies a specific tasking only partially.	☐ Provides useful information and analysis and addresses near-term, direct, or first-order implications; **AND** ☐ Adds value by addressing at least one of the following: trends or prospects, appropriate context, insight gained from synthesizing a large volume of information, warning of threats to U.S. interests, or factors affecting opportunities for U.S. actions (without prescribing U.S. policy); **OR** ☐ Satisfies a specific tasking fully.	☐ Satisfies "good" criteria; **AND** ☐ Assesses longer-term, indirect, or second-order implications; **OR** ☐ Provides exceptionally expert analysis (e.g., by drawing on multiple disciplines or presenting illuminating comparisons); **OR** ☐ Warns of threats in detail (e.g., by discussing specific indicators, likelihood, or imminence); **OR** ☐ Analyzes in detail factors affecting opportunities for U.S. action (e.g., by discussing risks, benefits, or possible reactions to potential U.S. actions).
Comment:			
6. Uses clear and logical argumentation			
☐ Poor (0)	☐ Fair (1)	☐ Good (2)	☐ Excellent (3)
☐ Lacks a main analytic message; **OR** ☐ Does not support analytic judgments with relevant evidence or undermines them by using flawed logic; **OR**	☐ Presents a main analytic message; **BUT** ☐ Does not combine evidence, context, and assumptions effectively to support analytic judgments or uses weak logic; **OR**	☐ Presents a prominent and clear main analytic message; **AND** ☐ Presents clear reasoning with no flaws in logic and effectively combines evidence, context, and	☐ Satisfies "good" criteria; **AND** ☐ Addresses any inconsistent or contrary information in a way that reconciles it with analytic judgments; **OR** ☐ Demonstrates notable skill or sophistication in combining evidence, context, and assumptions convincingly to

☐ Often uses unclear language or uses a structure that is not easily understood.	☐ Sometimes uses unclear language or a structure that at times is not easily understood.	assumptions to support analytic judgments; **AND** ☐ Uses clear language and a structure that displays a logical flow appropriate for the argument being presented.	support analytic judgments.
Comment:			

7. Explains change to or consistency of analytic judgments			
☐ Poor (0)	☐ Fair (1)	☐ Good (2)	☐ Excellent (3)
☐ Does not note or explain that a major analytic judgment differs from previous production.	☐ Does not note that a major analytic judgment is consistent with previous production; **OR** ☐ Notes how a major analytic judgment compares with previous production but does not explain how new information or reasoning supports changing or maintaining an existing analytic line.	☐ Notes how a major analytic judgment compares with previous production and explains how new information or reasoning supports changing or maintaining an existing analytic line.	☐ Satisfies "good" criteria; **AND** ☐ Highlights and explains how a major analytic judgment compares with judgments on the topic held within the U.S. intelligence community, not just within the same analytic element.
Comment:			

8. Makes accurate judgments and assessments			**Harvest Date:**		
Phase 1			**Phase 2:** Often accuracy cannot be evaluated until a later date. Establish a "harvest" date to revisit the assessment to evaluate Phase 2.		
☐ Unclear	☐ Conditioned	☐ Unconditioned	☐ Accurate	☐ No Accurate	☐ Indeterminate
☐ Judgment or assessment is not expressed clearly.	☐ Judgment or assessment is expressed clearly and is conditioned (e.g., by an "if/then" statement).	☐ Judgment or assessment is expressed clearly and is not conditioned (e.g., by an "if/then" statement).	☐ Judgment or assessment is found to be accurate.	☐ Judgment or assessment is found to be not accurate.	Accuracy could not be determined for any of several reasons: ☐ Nature of judgment or assessment prevented assessment of accuracy. ☐ Data needed to assess accuracy were not found. ☐ Irreconcilable views among evaluators prevented agreement on a final assessment of accuracy.
Comment:					

9. Incorporates effective visual information where appropriate			
☐ Poor (0)	☐ Fair (1)	☐ Good (2)	☐ Excellent (3)
☐ Does not use visual information when its use would have substantially complemented or enhanced an analytic product; **OR** ☐ Presents visual information that is inconsistent with or not pertinent to the text of an analytic product, or that confuses or detracts from an analytic product's presentation.	☐ Presents visual information that is pertinent to an analytic product; **BUT** ☐ Does little to clarify (illustrate, summarize, or provide greater detail), complement, or augment data or analytic points in an effective manner that enhances customer understanding of a product's analysis.	☐ Presents visual information that is pertinent to an analytic product; **AND** ☐ Clarifies (illustrates, summarizes, or provides greater detail), complements, or augments data or analytic points in an effective manner that enhances customer understanding of a product's analysis.	☐ Satisfies "good" criteria; **AND** ☐ Takes particularly effective advantage of visual presentational methods to convey data or analytic points in a way that enhances a product's value by making complex issues more understandable, adding insight or perspective, increasing knowledge retention, or highlighting trends, drivers, or indicators.
Comment:			

General Comments:
If an evaluator determines that a standard is **not applicable**, *it should be noted, with a justification, in the comment box.*

Table A4.2. Sample Tradecraft Criteria for Timeliness.

1. Poor (0)	2. Fair (1)	3. Good (2)	4. Excellent (3)
5. ISR element fails to provide analysis products and services in sufficient time to impact planning, operations, and decision-making	6. ISR element timeliness in providing analysis products and services marginally impacts planning, operations and decision-making	7. ISR element provides analysis products and services in sufficient time to impact planning, operations, and decision-making	8. ISR element provides analysis products and services at the earliest time and place to enable decision advantage and create significant mission and capability opportunities
Comment:			
Note: AF intelligence analysis is timely to impact planning, mission objectives, operations and to otherwise aid in commanders' decisions. Analysts are responsible for engaging with customers and end-users of intelligence to understand what they need and when they need it in order to deliver information and knowledge at the earliest time and place to enable customers to effectively make decisions and take action. Timeliness is about ensuring awareness, creating opportunities, and enabling warfighting decision advantage.			

Table A4.3. Sample Tradecraft Criteria for Customer Engagement.

1. Poor (0)	2. Fair (1)	3. Good (2)	4. Excellent (3)
1. ISR element has limited engagement with the customer to understand their requirements or seek feedback on product/service timeliness or utility	2. ISR element requests and responds to customer feedback for some, but not all, products and services	3. ISR element requests and responds to customer feedback for all products and services	4. ISR element satisfies "good" criteria; **AND** 5. Regularly engages with the customer to anticipate their requirements by understanding their operations, listening to their questions and concerns, and identifying intelligence needs to support documented capabilities and concepts; **AND** **6.** Has a formal engagement program established
Comment:			
Note: Analysis fully address customers' requirements within the time constraints and in a manner most useful. Analyst Airmen are responsive to customer feedback. While challenging to evaluate, this tradecraft standard is foundational to AF intelligence analysis.			

Attachment 5

AF ISR SAT TRADECRAFT GUIDE

A5.1. The following 19 figures are excerpts from an AF tradecraft guide on SATs, developed by AFCO-CFA. The figures offer insight into some, but not all, of the key SATs used in intelligence analysis to help improve tradecraft standardization across the AFIAE.

Figure A5.1. Imagination Techniques and Indicators.

IMAGINATION TECHNIQUES AND INDICATORS

Core Techniques	Description	When to Use
Structured Brainstorming	A group process for generating new ideas and concepts	Used to stimulate new thinking and generate a range of hypotheses about an issue
Red Team	A function executed by trained, educated, and practiced team members that provide an independent capability to fully explore alternatives from the perspectives of partners, adversaries, and others	Used to fully explore alternatives in plans, operations, concepts, organizations and capabilities in the context of the operational environment
Alternative Futures Analysis	Tool to help analysts explore multiple ways a situation can develop when there is high complexity and uncertainty	Mostly used when a situation is viewed as too complex or the outcomes are too uncertain to trust a single outcome assessment
Outside-In Thinking	Analytical tool used to identify the full range of basic forces, factors and trends that would indirectly shape an issue	Used to identify all the critical, external factors that could influence how a situation will develop

Figure A5.2. Structured Brainstorming.

STRUCTURED BRAINSTORMING

A technique for stimulating new thinking. It can be applied to virtually all of the other structured analytic techniques and allows the analyst to see a wider range of factors that might bear on the topic.

Brainstorming Ground Rules

1. Never criticize an analyst's ideas
2. Allow sufficient time to brainstorm
3. Involve at least one "outsider" in the process

Divergent Thinking Phase

1. "Post-It" note exercise

Convergent Thinking Phase

1. Arrange notes by commonalities to form clusters
2. Some notes may be moved or copied as cluster form
3. Select a word or phrase that characterizes each cluster
4. Identify any notes that do not fit with others and consider them useless noise or the beginning of an idea that deserves further attention (wild cards)
5. Select one or two areas that deserve the most attention
6. Set priorities based on consensus and decide on the next steps for analysis

Figure A5.3. Red Team Analysis.

RED TEAM ANALYSIS

Function executed by trained, educated, and practiced team members to provide commanders an independent capability to fully explore alternatives in plans, operations, concepts, organizations, and capabilities in the context of the operational environment and from the perspectives of partners, adversaries, and others.

Red Team Techniques

1. Team puts themselves into the adversary's circumstance and reacts as the adversary would
2. Assessments are not coordinated with anyone outside the team
3. Develop set of "first person" questions
4. Draft policy papers in which the group makes decisions, proposes recommendations, or develops courses of action
5. Present analysis in the first-person format
6. Avoid use of caveats or qualifications
7. Focus on a prediction based on the adversary's world
8. Do not plot out all possible courses of action

Figure A5.4. Alternative Futures Analysis.

ALTERNATIVE FUTURES ANALYSIS

An imaginative technique that systematically explores multiple scenarios. This technique can be used when a situation's uncertainty and complexity require consideration of more than one outcome.

Six-Step Process

1. Develop a focused issue and intelligence question
2. Identify drivers, forces, factors, and variables that can affect the issue
3. Select the two most critical and uncertain drivers
4. Establish plausible endpoints for each driver
5. Form a futures matrix by crossing the two axes. The resulting quadrants are the basis for alternative future scenarios
6. Build narratives that describe these futures and how they might come to be (Signposts or Indicators can then be developed)

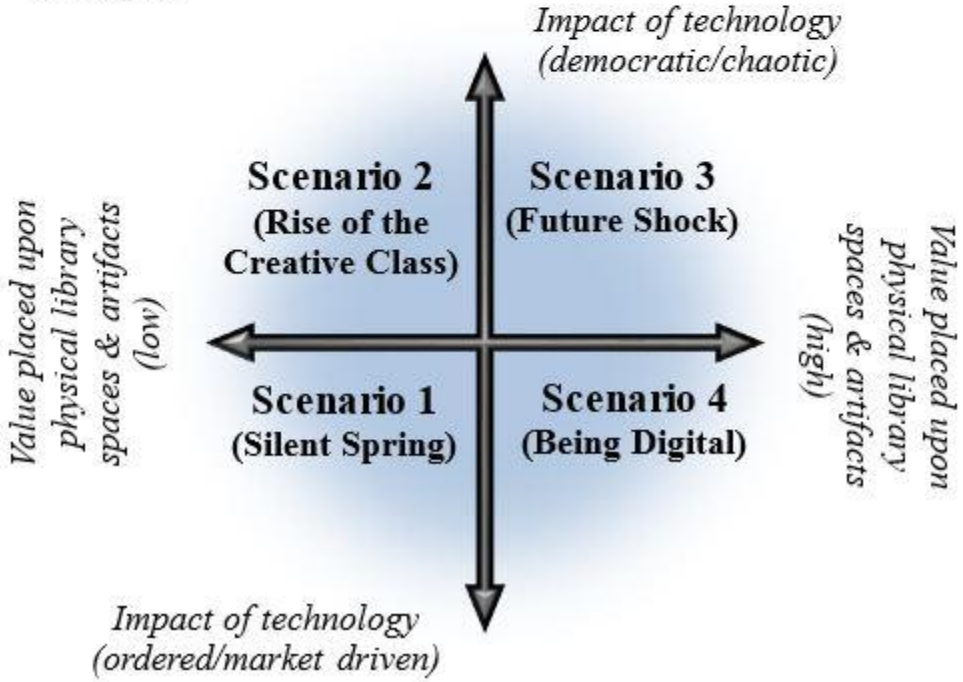

Figure A5.5. Outside-in Thinking.

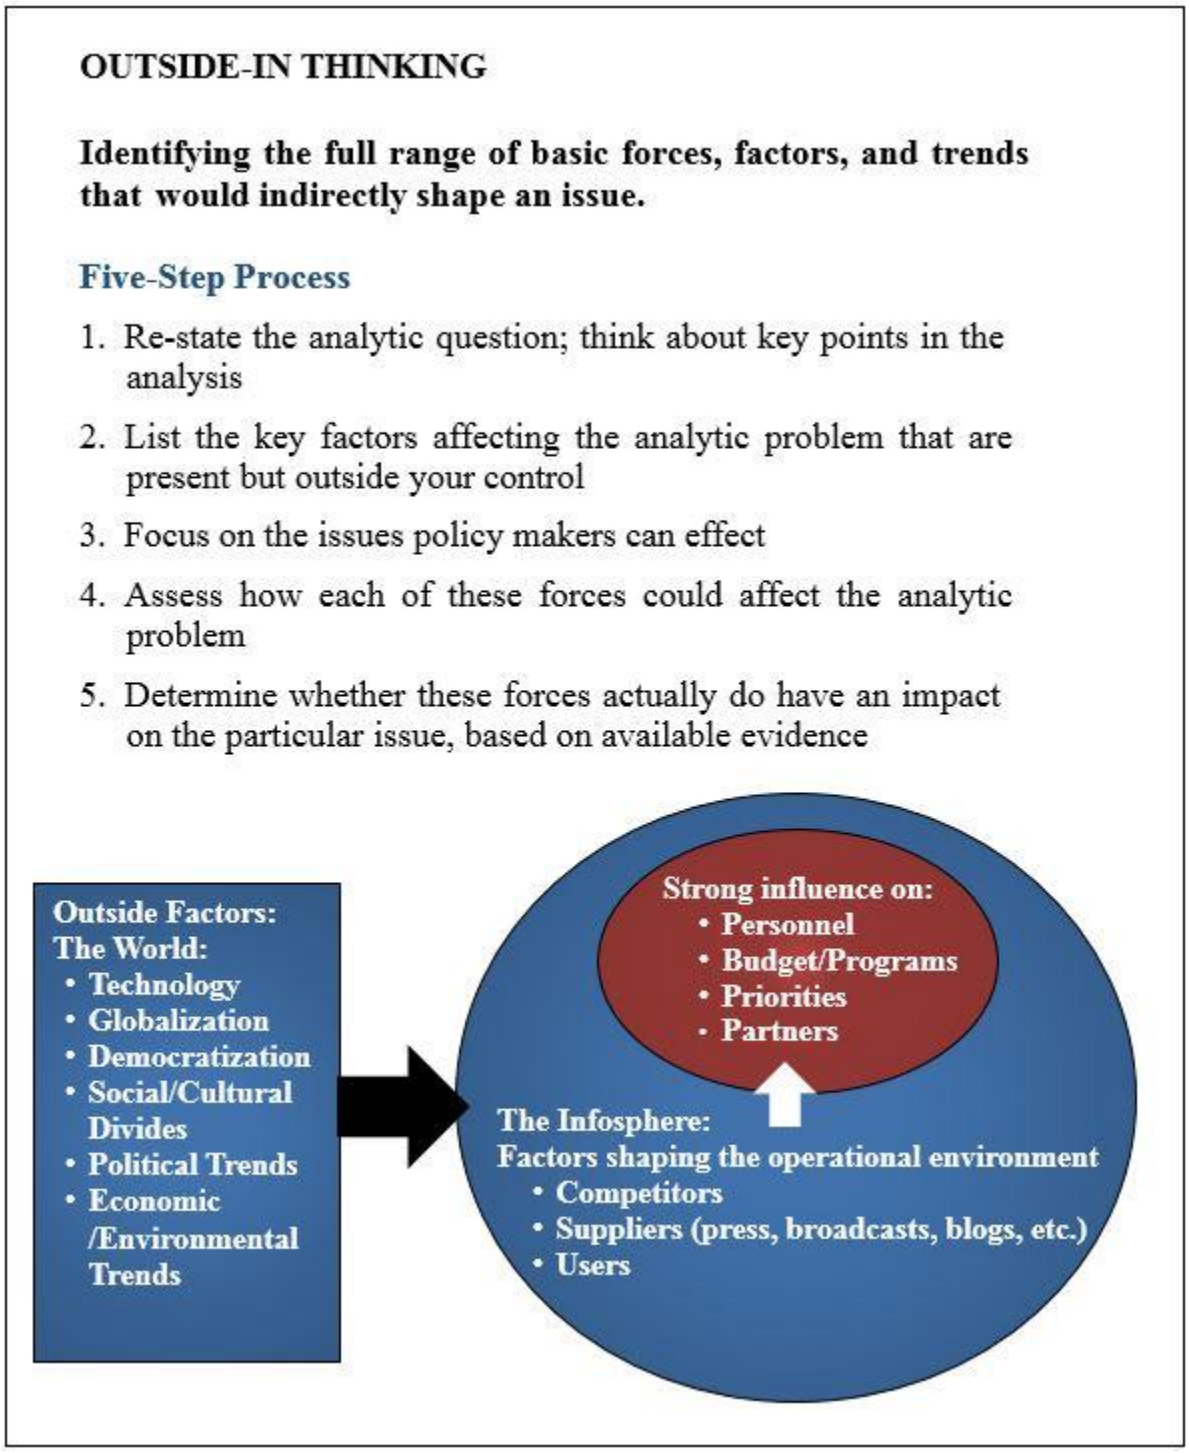

Figure A5.6. Diagnostic Techniques.

DIAGNOSTIC TECHNIQUES

Core Techniques	Description	When to Use
Key Assumptions Check	List and review the key working assumptions on which fundamental judgments rest	Most useful at the beginning of an analytic project
Quality of Information Check	Evaluate completeness and soundness of available information sources	Use to establish confidence level in analytic judgments, & ensure judgments are anchored to strong, relevant sources
Indicators or Signposts of Change	Reviewing observable events and trends to determine if a postulated situation is developing	Used to instill analytic rigor into the analytic process enhancing the credibility of analytic judgments
Deception Detection	Systematic use of checklists to determine when deception may be present and how to avoid being deceived	Used to counter adversary attempts of misinformation, concealment, and misdirection
Analysis of Competing Hypotheses	A systematic and logical approach to generate and evaluate all plausible hypotheses to solve a given problem	Any analysis where there are alternative explanations for what has happened, is happening, or is likely to happen

Figure A5.7. Key Assumptions Check.

KEY ASSUMPTIONS CHECK

A diagnostic technique that identifies hypotheses analysts have accepted to be true and that form the basis of the assumption

Four-Step Process

1. Review the analytic line on the issue; write it down for all to see and defend it orally
2. Articulate all the premises, both stated and unstated in finished intelligence, that are accepted as true for this analytic line to be valid
3. Challenge each assumption, asking why it must be true and whether it remains valid under all conditions
4. Refine the list of key assumptions to contain only those that must be true to sustain your analytic line; consider under what conditions, or in the face of what information, these assumptions might not hold

Questions to Ask

How much confidence exists that this assumption is correct?

What explains the degree of confidence in the assumption?

What circumstances or information might undermine this assumption?

Is a key assumption more likely a key uncertainty or key factor?

Could the assumption have been true in the past but be less so now?

If the assumption proves wrong, would it significantly alter the analytic line? If so, how?

Has this process identified new factors that need further analysis?

Figure A5.8. Quality of Information Check.

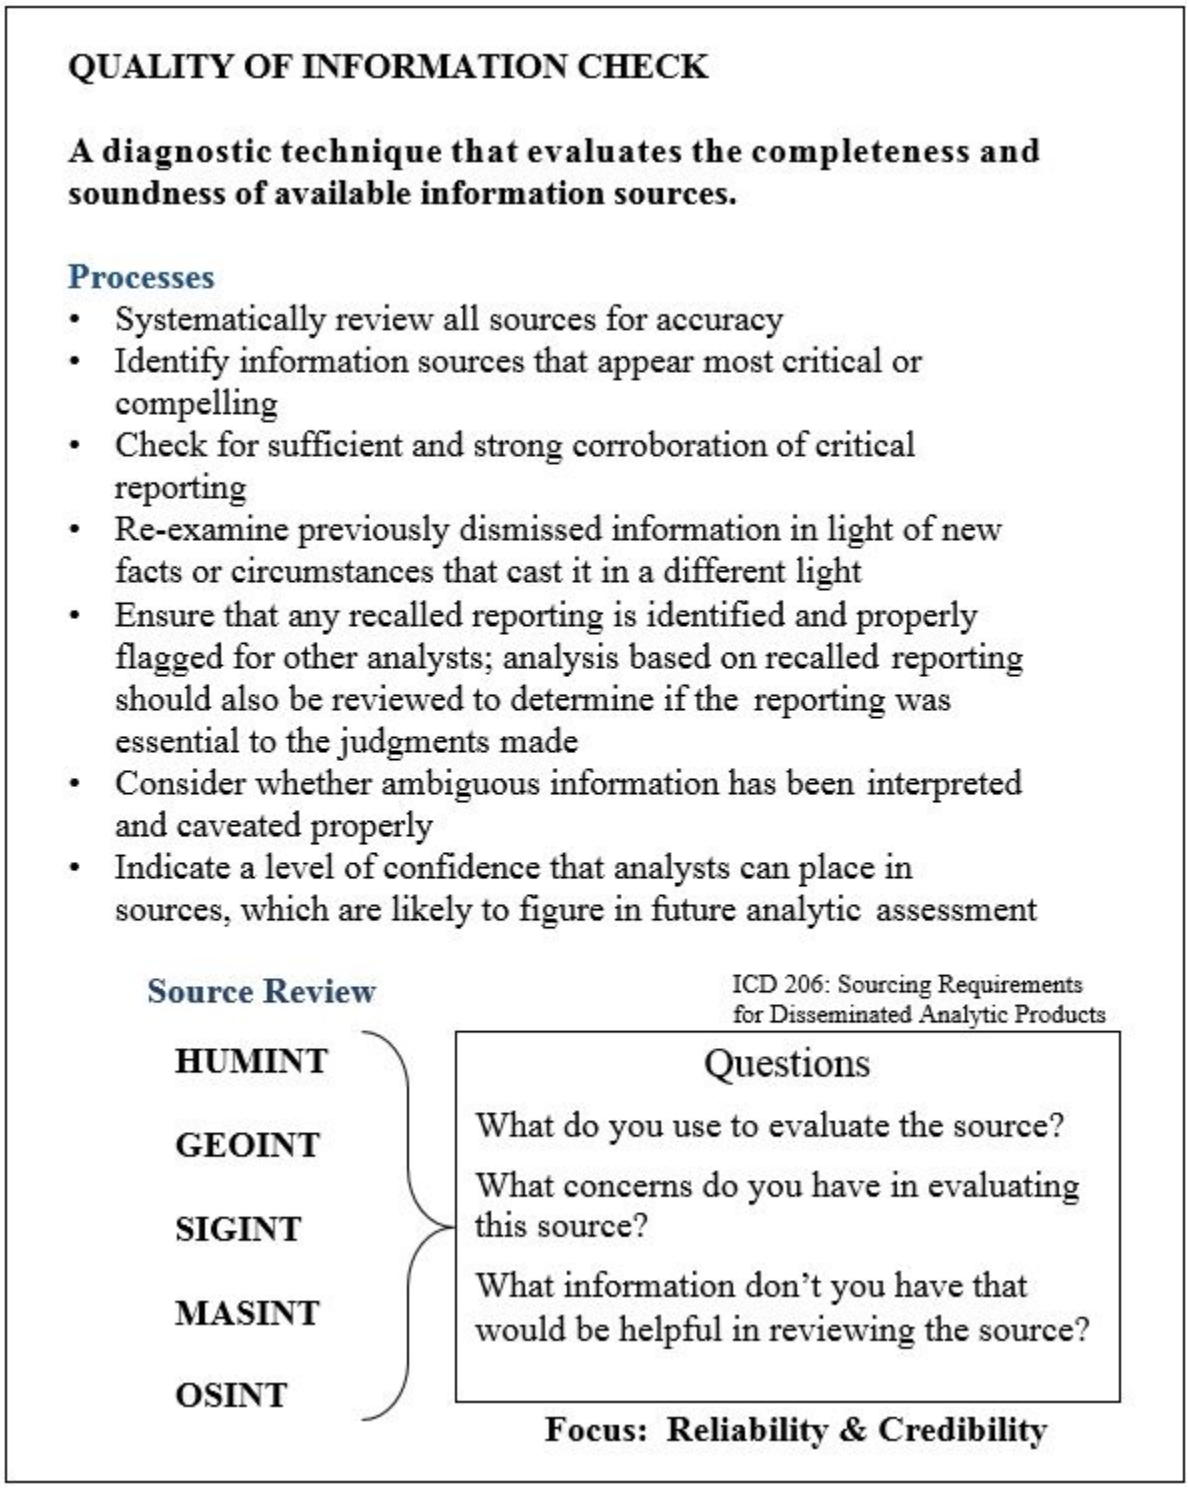

Figure A5.9. Indicators or Signposts of Change.

INDICATORS OR SIGNPOSTS OF CHANGE

Also called Signpost Analysis, this technique involves periodically reviewing a list of observable events or trends to track events, monitor targets, spot emerging trends, and warn of unanticipated change.

Indicator Technique Recommendations	
Analytic Environment	Indicator Technique
Non-Controversial • The issue is non-controversial within the IC or the policy community • Analysts and/or policymakers are uncertain about how the situation will actually evolve	• Simple lists of observables • Two contrasting lists of indicators (that would suggest a leader is growing stronger and a second list that he is growing weaker)
Somewhat Controversial • Some analysts or agencies have preferred positions or established equities to protect • The outcome has major policy or resource implications	• Use simple scales • Provide definitions for each indicator • Portray the information graphically • Revisit on periodic basis
Highly Controversial • Analysts hold strong, contrary views • Major institutional equities are at stake within the IC • The issue is highly charged within the policy community	• Provide a level of confidence for each rating • Provide a narrative description of what one would expect to observe at each level on a rating scale • List the sources of info and how important each was in establishing the rating

Figure A5.10. Deception Detection.

DECEPTION DETECTION

Diagnostic technique where analysts systematically use checklists to determine when deception actually may be present and how to avoid being deceived.

Does a foreign actor have the Motive, Opportunity and Means (MOM) to deceive?

1. Motive (What are the deceiver's goals?)
2. Channels (What means are available?)
3. Risks (What are the risks of discovery?)
4. Costs (Can deception be accomplished?)
5. Feedback (Can the deceiver monitor its use?)

Would this potential deception be consistent with Past Opposition Practices (POP)?

1. Does the deceiver have a history of deception?
2. Does this deception fit past patterns?

Is there cause for concern regarding the Manipulability of Sources (MOSES)?

1. Is the source reliable?
2. Does the source have access?
3. How good are the source's *bona fides*?
4. Is the source vulnerable to control or manipulation by the target?

What can be learned from the Evaluation of Evidence (EVE)?

1. How accurate is the source's reporting?
2. Is the whole chain of evidence available?
3. Does critical evidence check out?
4. Does evidence from one source conflict with others?
5. Do other sources of information provide corroborating evidence?
6. Is the absence of evidence unusual?

Figure A5.11. Analysis of Competing Hypotheses.

ANALYSIS OF COMPETING HYPOTHESES

Provides a systematic and logical approach to generate and evaluate plausible hypotheses to solve a given problem.

Eight-Step Process

1. Generate hypotheses
2. Gather and list evidence
3. Prepare the evidence and hypothesis matrix
4. Refine the matrix
5. Draw tentative conclusions
6. Perform sensitivity analysis
7. Report conclusions
8. Identify milestones

	Cred	Rel	H 1	H 2	H 3
Score			2	4	3
Evidence 1	H	H	C	C	C
Evidence 2	M	M	I	C	C
Evidence 3	M	M	C	C	I
Evidence 4	H	H	I	C	I
Evidence 5	M	M	I	I	C

H – High
M – Medium
L – Low

C – Consistent / Supports
I – Inconsistent / Does Not Support
N/A – Not Applicable

Figure A5.12. Focus Techniques.

FOCUS TECHNIQUES

Core Techniques	Description	When to Use
Issue Development	Used to ensure the central issues and alternative explanations of an issue or problem are identified within the scope and focus of the problem statement to aid in gathering the best answer	Used anytime analysts begin to assess a new issue or problem or begin a new research endeavor to mitigate bias toward the issue
Question Refinement	A simple technique to ensure analysts are answering the right question when responding to an intelligence requirement	Used when a consumer's intelligence requirement is not completely clear or when research begins to lead to ambiguity and confusion

Figure A5.13. Issue Development.

ISSUE DEVELOPMENT

A divergent technique that opens the mind of the analyst to substantive alternatives. Restating a problem opens it up and reveals important perspectives and issues otherwise overlooked.

Start with the initial poorly defined/stated issue

1. Paraphrase: Redefine the issue without losing the original meaning
2. 180 Degrees: Turn the issue on its head. Is the issue the one asked or the opposite of it?
3. Broaden the Focus: Instead of focusing on only one piece of the puzzle, step back and look at several pieces together
4. Narrow the Focus: Can the issue be broken down further? Take the question and ask about the components that make up the problem
5. Redirect the Focus: What outside forces impinge on this issue? Is deception involved?
6. Ask Why: Question the initial issue or question. Develop a new question based on the answer. Then question the second question and develop a new question based on that answer. Repeat this process until you believe the real problem emerges. This process is particularly effective in generating possible alternatives

End with a final refined issue

Figure A5.14. Question Refinement.

QUESTION REFINEMENT

A simple analytical technique used to ensure analysts are answering the right question when responding to a customer's intelligence requirement.

7-Step Process

1. **New Development -** Describe a change to the operating environment or security interests that result in a requirement for intelligence analysis and production.
2. **Raw Question(s) -** In response to the New Development, the immediate questions that come to mind, or that would come to mind for your customer. In relation to an event of interest, the raw questions could be, "Who did it and why?" or "What caused it?"
3. **Key Issue -** A key issue area normally includes an issue area and a geographic area. Issue areas are substantive categories of policy, strategy, or war fighting function. Key issue areas for a military operation can often be found in campaign descriptions of the lines of effort.
4. **National Interests -** The big picture must be considered thoughtfully when refining the intelligence requirement. Analysts should be able to tie assessments to U.S. security interests in general.
5. **Specific Customer Concerns -** This section of the refinery is often used to determine what questions are relevant and required to fulfill the intelligence question versus those specific requirements that might be better answered separately.
6. **Time Frame -** Answering your intelligence requirement should be targeted at a particular time, normally in the future (ex: "in the next 6 months," or "before 1 May 201X").
7. **Refined Question -** The refined intelligence question should be open-ended, requiring more than a yes or no answer, and should meet a specific customer's intelligence needs.

Figure A5.15. Contrarian Techniques.

CONTRARIAN TECHNIQUES

Core Techniques	Description	When to Use
Devil's Advocacy	Technique used to challenge a single, strongly held view or consensus by building the best possible case for an alternative explanation	Used when analysts need to provide further confidence that the current analytic line will hold up to close scrutiny
High Impact / Low Probability	Highlights a seemingly unlikely event that would have major policy consequences if it were to happen	Used when analysts believe an event is unlikely but have not given much thought to the consequences of its occurrence
What If? Analysis	A technique which assumes an event has occurred with potential (negative or positive) impact and explains how it might come about	Used to challenge a strong mindset that an event will not happen or be confidently justified
Team A / Team B Analysis	Separates teams to contrast two or more strongly held views or competing hypotheses	Used when there are two or more equally strong mind-sets held on an issue that need to be clarified (Devil's Advocacy challenges a single dominant mindset)

Contrarian: opposition or rejection of popular opinion

Figure A5.16. Devil's Advocacy.

DEVIL'S ADVOCACY

A contrarian technique for challenging a single, strongly held view or consensus by building the best-possible case for an alternative explanation.

Explicitly challenges key assumptions to see if they will not hold up under some circumstances.

Methodology

1. Outline the mainline judgment and key assumptions and characterize the evidence supporting the current analytic view
2. Select one or more assumptions—stated or not—that appear the most susceptible to challenge
3. Review the information used to determine whether any is of questionable validity, whether deception is possibly indicated, or whether major gaps exist
4. Highlight the evidence that could support an alternative hypothesis or contradicts the current thinking
5. Present to the group the findings that demonstrate there are flawed assumptions, poor quality evidence, or possible deception at work
6. Consider drafting a separate contrarian paper that lays out the arguments from a different analytic conclusion if the review uncovers major analytic flaws
7. Be sure that any products generated clearly lay out the conventional wisdom and are identified as an explicitly "Devil's Advocate" project; otherwise the reader can become confused as to the current official view on the issue

Figure A5.17. High Impact / Low Probability.

HIGH IMPACT / LOW PROBABILITY

A technique used to highlight a seemingly unlikely event that would have major policy consequences if it happened.

If there is a strongly-held view that an event is unlikely, then postulating precisely the opposite should not be difficult.

Perform the following steps to determine the effects of High Impact/Low Probability events:

1. Define the high-impact outcome clearly. This process is what will justify examining what most analysts believe to be a very unlikely development
2. Devise one or more plausible explanations for or "pathways" to the low probability outcome. This should be as precise as possible, as it can help identify possible indicators for later monitoring
3. Insert possible triggers or changes in momentum if appropriate. These can be natural disasters, sudden health problems of key leaders, or new economic or political shocks that might have occurred historically or in other parts of the world
4. Brainstorm with analysts having a broad set of experiences to aid the development of plausible but unpredictable triggers of sudden change
5. Identify for each pathway a set of indicators or "observables" that would help you anticipate that events were beginning to play out this way
6. Identify factors that would deflect a bad outcome or encourage a positive outcome

Figure A5.18. "What If" Analysis.

"WHAT IF" ANALYSIS

That "What If?" Analysis is the technique which assumes an event has occurred with potential (negative or positive) impact and explains how it might come about.

Method

1. Assume the event has happened
2. Select some triggering events that permitted the scenario to unfold to help make the "what if" more plausible; for example, analysts might postulate the death of a leader, a natural disaster, or some economic event that would start a chain of other events
3. Develop a chain of argumentation based as much on logic as evidence to explain how this outcome could have come about
4. "Think backwards" from the event in concrete ways–that is, specifying what must actually occur at each stage of the scenario is often very useful
5. Identify one or more plausible pathways or scenarios to the unlikely event; very often more than one will appear possible
6. Generate a list of indicators or "observables" for each scenario that would help to detect the beginnings of the event
7. Consider the scope of the positive and negative consequences of each scenario and their relative impacts
8. Monitor the indicators developed on a periodic basis

Figure A5.19. Team A / Team B.

TEAM A / TEAM B

Used when there may be competing and possibly equally strong mind sets held on an analytical issue; this approach helps opposing groups see the merit in each other's perspective.

Two Phases

1)Analysis Phase

1. Identify the two or more competing hypotheses or points of view
2. Form teams or designate individuals to develop the best case for each hypothesis
3. Review all pertinent information that supports their respective position
4. Identify missing information that would strengthen their hypotheses
5. Structure each argument, presenting key assumptions, key pieces of evidence, and careful articulation of the logic behind the argument

2)Debate Phase

1. Set aside time for an oral presentation of the alternative team findings; this can be an informal brainstorming session or a more formal debate
2. Have an independent jury of peers to listen to the oral presentation and be prepared to question the teams regarding their assumptions, evidence, or logic
3. Allow each team to present its case, challenge the other team's arguments, and rebut the opponent's critique of its case
4. Let the jury consider the strength of each presentation and recommend possible next steps for further research and collection efforts

Attachment 6

IC, DOD, AND MILITARY SERVICE REFERENCES

A6.1. The IC. As shown in Table A6.1, *Members of the IC*, the IC is a coalition of 17 agencies and organizations, including the ODNI, within the Executive Branch that work both independently and collaboratively to gather and analyze the intelligence necessary to conduct foreign relations and national security activities.

Table A6.1. Members of the IC.

Office of the Director of National Intelligence (ODNI)	
U.S. Air Force (USAF) Intelligence	Department of the Treasury
U.S. Army (USA) Intelligence	Drug Enforcement Agency (DEA)
Central Intelligence Agency (CIA)	Federal Bureau of Investigation (FBI)
U.S. Coast Guard (USCG) Intelligence	U.S. Marine Corps (USMC) Intelligence
Defense Intelligence Agency (DIA)	National Geospatial-Intelligence Agency (NGA)
Department of Energy (DOE)	National Reconnaissance Office (NRO)
Department of Homeland Security (DHS)	National Security Agency (NSA)
Department of State (DOS)	U.S. Navy (USN) Intelligence

A6.2. IC and DoD Reference Documents. Table A6.2, *Common IC and DoD Analysis References*, lists various IC and DoD publications that most often impact AF analysis.

Table A6.2. Common IC and DoD Analysis References.

IC
DNI *Principles of Intelligence Transparency for the Intelligence Community* ICD 191, *Duty to Warn* ICD 203, *Analytic Standards* ICD 204, *National Intelligence Priorities Framework* ICD 205, *Analytic Outreach* ICD 206, *Sourcing Requirements for Disseminated Analytic Products* ICD 208, *Maximizing the Utility of Analytic Products* ICD 209, *Tearline Production and Dissemination*
DoD
DoDI 3115.17, *Management and Oversight of DoD All-Source Analysis* DIA Directive (DIAD) 5000.200, *Intelligence Threat Support for Major Defense Acquisition*

Programs

DIA Instruction (DIAI) 5000.002, *Intelligence Threat Support for Major Defense Acquisition Programs*

DIAP Users Guide

DoD Directive (DoDD) 5000.01, *The Defense Acquisition System*

DoDD 5105.21, *Defense Intelligence Agency*

DoDD 5250.01, *Management of Intelligence Mission Data (IMD) in DoD Acquisition*

DoDI 5000.02, *Operation of the Defense Acquisition System*

A6.3. Military Services. As depicted in Table A6.3, *Major Intelligence Analysis Entities of the Military Services*, each military service has a SIO that oversees intelligence policy, planning, programming, and activities on behalf of the service chief. The AF SIO is the DCS for ISR, also known as the AF/A2. Each service is authorized one service intelligence center, also called an intelligence analysis center. The AF's service intelligence center is NASIC. The AF has assigned the ACC as its lead MAJCOM for the GIISR capability, which includes intelligence analysis. Similarly, other military services have assigned significant analysis responsibilities to various organizations. All services routinely reach out to each other for service-unique expertise and collaboration in addressing analysis requirements.

Table A6.3. Major Intelligence Analysis Entities of the Military Services.

	USAF	USA	USN	USMC	USCG
Service Senior Intelligence Officer (SIO)	Deputy Chief of Staff for ISR (USAF/A2)	Deputy Chief of Staff for Intelligence (USA/G2)	Director of Naval Intelligence (USN/N2/6)	Director of Intelligence (USMC/DIRINT)	Assistant Commandant for Intelligence (USCG/CG-2)
Service Intelligence Center	National Air and Space Intelligence Center (NASIC)	National Ground Intelligence Center (NGIC)	Office of Naval Intelligence (ONI)	Marine Corps Intelligence Activity (MCIA)	Intelligence Coordination Center (ICC)
Lead Command	Air Combat Command (ACC) 1. Core Function Lead Integrator (CFLI) for Global Integrated ISR (GIISR) **2.** Chair, Analysis Capability Working Group (ACWG)	Intelligence and Security Command (INSCOM)	N/A	N/A	N/A
Other Major Analysis Organizations	1.Intelligence Systems Support Office (ISSO) 2.363 ISRW 1.Civil Aviation Intelligence Analysis Center (CAIAC)		• Nimitz Operational Intelligence Center • Farragut Technical Analysis Center • Kennedy Irregular Warfare Center Hopper		• Maritime Intelligence Fusion Center Atlantic (MICF LANT) • Maritime Intelligence Fusion Center Pacific (MICF PAC) Coast Guard Investigative Service (CGIS)

			Information Services Center		
Counter-Intelligence Organizations	AF Office of Special Investigations (AFOSI)	Army Counterintelligence Center (ACIC)	Naval Criminal Investigative Service (NCIS)	2nd Intelligence Battalion	Coast Guard Counterintelligence Service (CGCIS)

Notes:
1. The USA service intelligence center (NGIC) falls under INSCOM. The service intelligence center in each of the other military services falls under the service SIO.
2. The AF assigns a CFLI to each of its major capabilities. The ACC Commander is the GIISR CFLI, which includes intelligence analysis. The ACC staff coordinates closely with intelligence analysis stakeholders across the AFIAE to develop, program, and advocate for intelligence analysis capabilities and requirements.
3. The ACWG serves as a cross-MAJCOM entity of analysis stakeholders responsible for supporting the development and advancement of air, space, and cyberspace intelligence analytical capabilities within the AF ISR Enterprise and across the full range of military operations. The ACWG provides a means to coordinate, assess, and synchronize AF intelligence analysis policies, tradecraft, education, training, and tools, as well as to recommend materiel and non-materiel solutions through established AF processes and offices.

A6.4. Common Analysis Organizations. Table A6.4, *Intelligence Analysis Organizations by Mission Type*, identifies IC, DoD, military service, and other government agencies organized according to the primary analysis they conduct. The table is not meant to be exhaustive; rather it provides a sampling of missions and the key analysis organizations that support them.

Table A6.4. Intelligence Analysis Organizations by Mission Type.

Air / Integrated Air Defense Systems	**Short Range Missiles**	**Med / Long Range Missiles**	**Ground**
NASIC	MSIC	NASIC	NGIC
Maritime	**Space**	**Cyber**	**Counter-IED**
ONI MCIA	NASIC NRO 14 AF	CYBERCOM NSA NASIC 24 AF 25 AF AFOSI	JIDA
Counter-terrorism	**Counter-intelligence**	**Threat Finance**	**Criminal**
NCTC DHS FBI CIA CGIS	AFOSI CIA FBI ACIC NCIS 2d Intelligence Btn CGCIS	Treasury FBI	AFOSI FBI NCIS CID CGIS
Rotary Wing	**Unmanned Systems**	**Surface-to-Air Missiles**	**Electronic Warfare Systems**
NGIC	NASIC NGIC ONI	MSIC	NASIC NGIC ONI
Rapid Air Mobility	**Global Commons**		
AMC AIS	CAIAC		

	NAI2O TRANSCOM JIOC AMC AIS MIFC LANT MIFC PAC		

Notes:
1. As the DoD functional manager for analysis, DIA provides overarching all-source analysis and/or guidance for all mission types listed.
2. The Missile and Space Intelligence Center (MSIC) is an equivalent organization to the service intelligence centers. Additionally, MSIC provides support to space analysis.
3. CYBERCOM—Cyber Command; JIDA—Joint Improvised-Threat Defeat Agency; NCTC—National Counterterrorism Center; CGIS—Coast Guard Investigation Service; Btn—Battalion; CID—Criminal Investigation Command; NAI2O—National Aviation Intelligence Integration Office; TRANSCOM—Transportation Command

Attachment 7

ONLINE RESOURCES FOR ANALYSIS SKILLS AND TRADECRAFT.

Table A7.1, *Online Resources for Skills and Tradecraft,* identifies resources that contain additional background, information, and guidance on analysis skills and tradecraft topics discussed in Chapter 5. The list reflects some of the common resources as of 2017 and is not meant to be exhaustive nor all-inclusive.

Table A7.1. Online Resources for Skills and Tradecraft.

Attachment 8

ANNOTATED BIBLIOGRAPHY

This attachment contains IC and academic resources for analyst Airmen to reference to improve their analysis aptitude. The list reflects some of the common references as of 2017 and is not meant to be exhaustive nor all-inclusive.

A8.1. Analysis Skills, Tradecraft, and Processes in the IC. The following texts focus specifically on IC analysis.

711th Human Performance Wing (HPW), ***The Framework for Analytic Cognition (FAC)***, AFRL, Wright-Patterson Air Force Base, Ohio, April 2014
This report serves as a guide to conducting intelligence analysis thoroughly while remaining sufficiently pliable to adapt to unstructured issues. It focuses on describing methods to foster analyst understanding of human-shaped capabilities and intentions for application in intelligence missions.

CIA, ***A Tradecraft Primer: Structured Analytic Techniques for Improving Intelligence Analysis,*** March 2009, https://www.cia.gov/library/center-for-the-study-of-intelligence/csi-publications/books-and-monographs/Tradecraft%20Primer-apr09.pdf
This guide highlights several structured analytic techniques to outline and assist analysts to think about and work difficult problems associated with intelligence analysis. The primer identifies several hurdles to this process such as biases, expectations, and mental models. Ultimately, the guide aims to inform intelligence analysts about their thinking processes to increase their self-awareness and efficacy in making judgments.

Clark, Robert M., ***Intelligence Analysis: A Target-Centric Approach***, 4th edition, CQ Press, 2012
This book urges analysts to focus on the intelligence problem at hand to drive insight. It provides a thorough overview of how the intelligence analysis process works with ample examples. The book also identifies areas where intelligence analysis could/should work better.

Clark, Robert M., ***The Technical Collection of Intelligence***, CQ Press, 2010
This book examines the technical means by which advanced countries collect intelligence information (acoustic, infrared, etc.). The author describes the collection, processing, and exploitation phases of intelligence technical collection in an understandable language.

Defense Intelligence Reference Document DIA-01-1003-001A, ***Tradecraft Primer: Basic Structured Analytic Techniques***, 4th edition, 3 March 2011
This DIA handbook provides an outline of analytic methods to help intelligence analysts improve their critical thinking skills, producing more thorough, less biased judgments. The techniques provided in this text also function to build a common lexicon in the IC, fostering consistent understanding and thereby efficiency and accuracy.

Folker, Robert D. Jr., ***Intelligence Analysis in Theater Joint Intelligence Centers: An Experiment in Applying Structured Methods***, Occasional Paper #7, Joint Military Intelligence College, 2000
This summary of a master's thesis compares the results of those who used a specific structured analytic technique with those who did not in preparing intelligence estimates.

Fingar, Thomas, ***Reducing Uncertainty: Intelligence Analysis and National Security***, Stanford Security Studies, 2011

The goal of this book is to inform readers from outside the IC what analysts in the IC do and how they do it. The book explains the pressures IC analysts are under (political etc.), why they often focus on worst-case scenarios, and the value of National Intelligence Estimates.

Fischhoff, Baruch, and Cherie Chauvin, ***Intelligence Analysis: Behavioral and Social Scientific Foundations***, National Academies Press, 2011

This book focuses on the human aspect of the IC and how to improve judgments made by both individual analysts and groups of analysts. The book provides an overarching perspective on the issues and processes that contribute to tough decision and judgment making.

George, Roger Z., and James B. Bruce, ed., ***Analyzing Intelligence: Origins, Obstacles and Innovation***, Washington D.C.: Georgetown University Press, 2008

This book provides a post-9/11 assessment of the state of intelligence analysis. The text offers insights into the obstacles for intelligence analysis, providing a plan to improve analytical methods, training, and approach. The book highlights adapted tradecraft, predictive analysis, and collaboration as areas needing improvement.

Grabo, Cynthia, ***Anticipating Surprise: Analysis for Strategic Warning***, University Press of America, 2002

This book, originally designed as a CIA analyst training guide, outlines the steps in the anticipatory analysis process, including discussing guidance for assessing the meaning of pieces of intelligence. In the wake of post-9/11 IC critiques, the author provides suggestions on how to improve and clarify warnings to decision makers.

Hackman, Richard J., ***Collaborative Intelligence: Using Teams to Solve Hard Problems***, San Francisco: Berrett-Koehler Publishers Inc., 2011

The book highlights the increased need and prevalence for interdisciplinary collaboration in intelligence analysis and identifies that most teams in the field often break down or prove ineffective. The author outlines six conditions leaders can employ to encourage the development, efficacy, and maintenance of teams working on intelligence analysis tasks.

Hall, Wayne Michael, and Gary Citrenbaum, ***Intelligence Analysis: How to Think in Complex Environments***, Santa Barbara, California: Praeger Security International, 2010

This book discusses the various types of advanced analysis—including anticipatory, semiotics, and link analysis—while laying out the steps of analytical problem solving: decomposition, critical thinking, analysis, recomposition, and synthesis. The book also discusses the systems of thought and how those impact an individual's analytical process and decision/judgment.

Heuer, Richards J., Jr., ***The Psychology of Intelligence Analysis***, Washington, D.C.: Central Intelligence Agency, Center for the Study of Intelligence, 1999

This collection of CIA articles spanning 1978-1986 reviews timeless concepts of cognitive psychology concerning how individuals gather and process information to shape their judgments.

Heuer, Richards J., Jr. and Randolf H. Pherson, ***Structured Analytic Techniques For Intelligence Analysis***, Washington, D.C.: CQ Press, 2014

This text identifies best practices in structured analysis to inform analysts within the intelligence field and across other disciplines.

Kent, Sherman, ***Strategic Intelligence for American World Policy***, Princeton University Press, 2015

This book was originally written and published in 1966 by Sherman Kent, who pioneered many of the methods of intelligence analysis. The book analyzes the varied aspects of what is known as "high-level foreign positive intelligence." Kent asserts that very little of it involves cloaks and

daggers. All of it is important to national survival, and should be understood by the citizens of a democracy.

Kerbel, Josh, and Anthony Olcott, *Synthesizing with Clients, Not Analyzing for Customers*, Studies in Intelligence, Vol. 54, No. 4. December 2010, https://www.cia.gov/library/center-for-the-study-of-intelligence/csi-publications/csi-studies/studies/vol.-54-no.-4/synthesizing-with-clients-not-analyzing-for.html

This article discusses the challenges, purpose, and shortcomings of the separation between analysts and the policy/decision makers they inform. One purpose is to avoid politicization of analysis and mitigate confirmation biases, but the separation can also lead to unanswered questions from decision-makers or ignored reports created by the analysts but not read.

Lowenthal, Mark M., *Intelligence: From Secrets to Policy*, 6th edition, CQ Press, 2014

This text provides an introduction to the field of intelligence, from both the analyst and policymaker perspectives. This book covers all phases and domains of intelligence analysis, providing current event examples and trends to watch.

Moore, David T., *Critical Thinking and Intelligence Analysis*, 2nd edition, Books Express Publishing, 2010

This book, sponsored by the National Defense Intelligence College, establishes how critical thinking fits into intelligence analysis. The author offers input on how to teach critical thinking to analysts with the goal of integrating into the intelligence analysis process.

Moore, David T., *Sensemaking: A Structure for an Intelligence Revolution*, 2nd edition, CreateSpace Independent Publishing Platform, 2013

The goal of this book is to identify where and how to improve the IC and its processes. The text identifies problem areas, including discussions of 'wicked problems,' complexity theory, and macro-vs-micro cognition. It also proposes possible solutions.

Symon, Paul B., and Arzan Tarapore, "Defense Intelligence Analysis in the Age of Big Data," *Joint Forces Quarterly*, Vol 79, 4th Quarter 2015

This article discusses the emerging challenge of big data analytics for military intelligence communities. The article highlights that, although big data generates knowledge creation, additional tools and methods are needed to absorb, process, and analyze the vast onslaught of information.

White, Jeffrey, *Shakespeare for Analysts: Literature and Intelligence*, CreateSpace Independent Publishing Platform, 2013

This paper, originally sponsored by the Joint Military Intelligence College in 2003, advocates inclusion of Shakespeare in intelligence analysts' bookshelves. The author asserts that since analysts are concerned with human personalities within political and military leadership, analysts should use Shakespeare's work as insight into how people are motivated and pursue power.

Zegart, Amy B., *Flawed by Design: The Evolution of the CIA, JCS, and NSC*, Stanford University Press, 2000

Using an institutionalist approach, the author asserts that the CIA, Joint Chiefs of Staff (JCS), and National Security Council (NSC) are hindered from operating effectively by design. Frequent elections, the prominence of elected officials controlling these organizations, and Congressional checks foster competitive, rival organizations fighting amongst themselves to protect their own intelligence assets.

A8.2. Analysis Skills, Tradecraft, and Processes in General . Whereas section A8.1 identifies sources that specifically address IC skills, tradecraft, and processes, the following

sources apply to the discipline of analysis writ large. While the following were written with a broader academia focus, they are also relevant to IC analysis.

Bothamley, Jennifer, *Dictionary of Theories*, Barnes & Noble, 2004
This book is a composite reference that alphabetically arranges theories, laws, hypotheses, etc. from across many disciplines. It serves as a thorough annotated bibliography of well-known theories, and includes short descriptions and comments on the validity of each entry.

Cukier, Kenneth Neil, and Viktor Mayer-Schoenberger, "The Rise of Big Data: How It's Changing the Way We Think," *Foreign Affairs*, May - June 2013, https://www.foreignaffairs.com/articles/2013-04-03/rise-big-data
This article discusses the concept of big data, describing the vast and increasing amount of information that can be harnessed, processed and used to support trends and inform new knowledge. The article also cautions that big data should be used to inform but not explain everything.

Dewey, John, *How We Think*, Boston, Massachusetts: D.C. Heath and Co. Publishers, 1910
This book offers an early overview of the importance of self-awareness in thought. The author calls for a focus in "mental training" and "training of thought" to increase one's deliberateness when thinking, solving, and assessing problems.

Elder, Linda, and Richard Paul, *The Thinker's Guide to Analytic Thinking*, 2nd edition, Dillon Beach: Foundation for Critical Thinking Press, 2007
This guide describes the structures and importance of analytic thinking. The authors discuss how we reach our conclusions and judgements–viewing an idea through our biases, point of view, experiences, and assumptions. The book provides a framework for understanding how we think and how that impacts decisions.

Facione, Peter, *Critical Thinking: What It Is and Why It Counts*, Milbrae, California: Measured Reasons and the California Academic Press, 2013
This essay familiarizes readers with the key skills and habits associated with critical thinking and why practicing critical thinking is useful in their personal and social decision-making. The article identifies several of the heuristic strategies individuals are naturally inclined towards and the pros/cons and biases associated therein.

Facione, Peter, and Carol Ann Glittens, *Think Critically*, 3rd edition, Prentice Hall, Pearson Education Inc., 2015
This text introduces and practically describes critical thinking as important for making big decisions in the real-world.

Foundation for Critical Thinking, *The Critical Thinking Community*, http://www.criticalthinking.org
This website is sponsored by the Foundation for Critical Thinking, a non-profit organization that seeks to promote essential change in education and society through the cultivation of fair-minded critical thinking—thinking which embodies intellectual empathy, humility, perseverance integrity, and responsibility.

Gilovich, Thomas, *How We Know What Isn't So: The Fallibility of Human Reason in Everyday Life*, The Free Press, 1991
This book addresses the question: When can we trust what we believe, and when are these beliefs suspect? Thomas Gilovich offers a wise and readable guide to the fallacy of the obvious in everyday life. Illustrating his points with vivid examples, he documents the cognitive and social processes that distort our thoughts, beliefs, judgements, and decisions, inevitably altering our impression of reality.

Grimes, Geoffrey, ***Scholasticism, Rationalism, and Empiricism: Epistemology and Three Western Systems of Reasoning***, http://www.distancelearningassociates.org/eng2327/BC-ReasoningSystems.htm
This website discusses the basic concepts of what the author describes as three core systems of reasoning: scholasticism, rationalism, and empiricism. The author asserts all those raised in Western cultures can be binned into one of these three categories.
Jones, Morgan D., ***The Thinker's Toolkit: 14 Powerful Techniques for Problem Solving***, Crown Business, 1998
This handbook provides fourteen tools to help individuals break down problems, enabling more efficient and informed decisions.
Kahneman, Daniel, ***Thinking, Fast and Slow***, New York: Farrar, Straus and Giroux, 2011
In this book author Daniel Kahneman describes the two systems of thinking: the intuitive (fast System 1) and the logical (thorough System 2). The text describes the identifiers of each system and how it impacts our decisions. The author provides methods to identify and prevent mental shortcuts that can cause judgement errors.
Kahneman, Daniel, Andrew Rosenfield, Linnea Gandhi, and Tom Blaser, ***Noise: How to Overcome the High, Hidden Cost of Inconsistent Decision Making***, Harvard Business Review, 2016
This article explains the difference between the concepts of "noise" and bias and provides a prescription of how leaders can test the level of "noise" in their organizations. Further, it describes steps to mitigate noise and promote analytical consistency.
Kahneman, Daniel, Paul Slovic, and Amos Tversky, ***Judgement under uncertainty: Heuristics and biases***, Cambridge University Press, 1982
This book describes the various judgment heuristics and biases. The text discusses how those biases can impact decision-making and judgments and suggests methods for identifying and overcoming these biases.
Kaplan, Abraham, ***The Conduct of Inquiry: Methodology for Behavioral Science***, Transaction Publishers, 1998
In this book the author discusses the various behavioral science disciplines and the methodologies and shortcomings of each. It provides a constructive assessment of the various standards and strategies of social research methods to guide behavioral scientists' research.
Kosko, Bart, ***Fuzzy Thinking: The New Science of Fuzzy Logic***, Hyperion, 1993
This book discusses the concept of fuzzy thinking/fuzzy logic, the principle that nothing is absolute. The author challenges the typical Western thinking that there is black and white—right and wrong, asserting that there are lots of shades of gray, with many perspectives.
Krizan, Lisa, ***Intelligence Essentials for Everyone***, Joint Military Intelligence College, June 1999
This paper provides guidance for the implementation of sound intelligence within and outside government infrastructure. The author describes the methods to employ to reach empirically-supported decisions with fewer flaws.
Laney, Douglas, et al., ***How Data Scientist Skills and Qualifications Differ from those of BI Analysts and Statisticians***, 21 October 2015
This article helps readers understand the distinction between the new data scientist career and associated skill-set and the legacy career of statisticians. Additionally, the authors describe why a statistician is not adequate for data science problems.

Lengler, Ralph, and Martin J. Eppler, ***A Periodic Table of Visualization Methods***,
http://www.visual-literacy.org/periodic_table/periodic_table.html
This online learning tool informs users on the ability to generate, understand, and apply visualizations. The site employs a didactic approach using problem-based learning techniques to foster understanding of visualization methods.
Linden, Alexander, et al., ***Organizational Principles for Placing Advanced Analytics and Data Science Teams***, 4 September 2013
With the onslaught of big data driving the need for teams of advanced analysts and data scientists in organizations of various disciplines, this article discusses where to best place these teams organizationally and the pros and cons of various locations.
Livio, Mario, ***The Equation that Couldn't be Solved: How Mathematical Genius Discovered the Language of Symmetry***, Simon & Schuster, 2006
This book attempts to explain mathematical symmetry through a "quantic" equation to non-mathematically inclined readers. The text discusses how the idea of group theory arose.
Mackay, Charles, ***Extraordinary Popular Delusions and the Madness of Crowds***, CreateSpace Independent Publishing Platform, 2013
This book studies the psychology of crowds and mass mania with historical examples such as the witch hunts. The text offers explanation as to why reasonable, intelligent individuals take on opinions in a crowd environment that they otherwise would not.
Margolis, Howard, ***Patterns, Thinking, and Cognition: A Theory of Judgement***, Chicago, Illinois: University of Chicago Press, 1987
This book discusses how pattern recognition impacts thinking and judgment. The author discusses identification of patterns, sub-patterns and when anomalies are actually part of the pattern.
Mlodinow, Leonard, ***The Drunkard's Walk: How Randomness Rules Our Lives***, Vintage, 2009
This book discusses how much of our lives are lived and guided by randomness. He introduces the concept of chaos theory, and reveals psychological illusions guiding "chance." The text presents several tools to help readers make more informed decisions in their everyday lives.
Pirsig, Robert M., ***Zen and the Art of Motorcycle Maintenance***, Bantam, 1975
In this book the author combines philosophy with the practical, real-world processes of motorcycle mechanics. Despite the title, this book prompts the reader to deep-think about critical thinking methods and more complex philosophical dilemmas, such as good-vs-evil.
Surowiecki, James, ***The Wisdom of Crowds***, Anchor Books, 2008
This book asserts that crowd-sourcing perspectives, or incorporating a range of diverse perspectives, improves problem-solving. The author identifies four necessary conditions that, when met, produce crowds that are smarter together than any one individual.
Tetlock, Philip E., and Dan Gardner, ***Superforecasting: The Art and Science of Prediction***, 1st edition, 2015
In this work, Philip Tetlock and coauthor Dan Gardner offer a masterwork on prediction, drawing on decades of research and the results of a massive, government-funded forecasting tournament. Superforecasting offers the first demonstrably effective way to improve our ability to predict the future.
Tufte, Edward R., ***The Visual Display of Quantitative Information***, 2nd edition, Cheshire, Connecticut: Graphics Press, 2001

This text covers the theory and practice used in the design and use of statistical graphics, charts and tables. It outlines the benefits and potential misrepresentation of empirical visualization methods.

A8.3. Studies and White Papers on Analysis. ***Air Force Intelligence Analysis Roles and Responsibilities Review for 2016***, September 2016

This report is a primary deliverable for the AF Analysis Plan of Action and Milestones. The report details the results of an AF-wide review of roles and responsibilities for analysis and production.

Alkire, Brien, Abbie Tingstad, Dale Benedetti, Amado Cordova, Irina Danescu, Lt Col William Fry, Brig Gen (ret.) D. Scott George, Lawrence M. Hanser, Lance Menthe, Erik Nemeth, David Ochmanek, Julia Pollak, Jessie L. Riposo, Lt Timothy Smith, Alexander Stephenson, ***Leveraging the Past to Prepare for the Future of Air Force Intelligence Analysis***, Santa Monica, California: RAND Corporation, RR-1330-AF, 2016, http://www.rand.org/pubs/research_reports/RR1330.html

This RAND report looks to the past for lessons to help inform recommendations in addressing future challenges for the AFIAE. The report identifies challenges regarding future operational pace, contextual and deep knowledge, the integration and understanding of space and cyber missions, and the growing volume of data to be analyzed.

Chang, Welton, Eva Chen, Barbara Mellers, and Philip Tetlock, "Developing Expert Political Judgment: The Impact of Training and Practice on Judgmental Accuracy in Geopolitical Forecasting Tournaments," ***Judgment and Decision Making*** 11, no. 5 (2016): 509-26

This essay tests the power of a cognitive-debiasing training module to improve probability judgments in a four-year series of geopolitical forecasting tournaments sponsored by the U.S. Intelligence Community.

Committee on Improving the Effectiveness and Efficiency of U.S. Air Force Pre-Acquisition Development Planning et al., ***Development Planning: A Strategic Approach to Future Air Force Capabilities***, National Academies Press, 2015

This book provides recommendations, informed by development planning efforts of the past, for leaders to think strategically into upcoming decades concerning where the AF may have capability gaps.

Committee on U.S. Air Force Strategic Deterrence Military Capabilities in the 21st Security Environment et al., ***U.S. Air Force Strategic Deterrence Analytic Capabilities: An Assessment of Tools, Methods, and Approaches for the 21st Century Security Environment***, National Academies Press, 2015

This book describes the analytic skills required in successful nuclear deterrence. The text also discusses how nuclear deterrence works through assurance and posture, how it can fail, and how to mitigate the risk of deterrence failure.

DCS for ISR White Paper, ***Data Science and the USAF ISR Enterprise***, February 2016, http://www.defenseinnovationmarketplace.mil/resources/Data_Science_and_the_USAF_ISR_Enterprise%20_White_Paper.PDF

This paper explores the impact of big data, the transformation of IC information technology, and how each will drive the necessity for an AF ISR strategic approach to data science.

DCS for ISR White Paper, ***Five Examples of Big Data Analytics and the Future of ISR***, November 2014

This paper describes the concept of big data and how it relates to ISR now and in the future through five examples. The paper asserts that big data is the new norm and intelligence professionals must adapt the way they employ data analytics to harness the depth of information now available.

DCS for ISR White Paper, *Revolutionizing AF Intelligence Analysis*, January 2014, http://www.defenseinnovationmarketplace.mil/resources/20140211_IntelligenceAnalysisWhitePaper_PA.pdf

This paper seeks to explain the increasing priority of analysis by identifying motivations, presenting a common lexicon, exploring key issues, and outlining the way ahead. The paper asserts that intelligence analysis is changing and increasing in prominence and therefore our analysis processes and emphasis must also adapt.

ISR Capability Planning and Analysis Process Committee on Examination of the Air Force Intelligence, *Capability Planning and Analysis to Optimize Air Force Intelligence, Surveillance, and Reconnaissance Investments*, National Academies Press, 2012

This report answers a request from the AF to assess the current AF approach to ISR corporate planning and programming. The report identifies best practices and recommends specific improvements to build-out existing tools and processes to ensure AF ISR processes can enable successful satisfaction of customer needs in accomplishing their missions.

Lin-Greenberg, Capt Erik, Krysten Young, and Col Brian Ray, *Improving Intelligence Analysis for the A2/AD Environment*, March 2015

This paper discusses the impact an Anti-Access/Area Denial (A2/AD) environment would have on the AF's ability to collect, analyze, and act on intelligence.

McClung, Lt Col Michael E., *2 Propositions Regarding Intelligence for Airpower*, Air University, 14 February 2013

This research paper provides two propositions concerning AF intelligence: 1) "the nature of intelligence for airpower is driven by the rapid evolution and expanding breadth of airpower itself" and; 2) "Analysis is the essence of intelligence for airpower, and like airpower it is broad, but targeting and threat analysis are central."

Report of USAF ISR Analysis and Production–CY 2014, 19 June 2014

This report is the result of a survey of AF ISR leaders to document AF production, including identifying production goals, focus, and areas for improvement. This survey built upon findings from a 2013 survey and further developed a baseline for comparison of the 2016 survey results.

Survey Report of USAF All-Source Intelligence Analysis, 1 August 2013

This report is the outcome of a survey to gage results and assessments of AF all-source analysis. The report asserts that if the USAF is serious about 'revolutionizing analysis,' it must concur with improved emphasis and investment.

Treverton, Gregory F., and C. Bryan Gabbard, *Assessing the Tradecraft of Intelligence Analysis*, Santa Monica, California: RAND Corporation, 2008, http://www.rand.org/content/dam/rand/pubs/technical_reports/2008/RAND_TR293.pdf

This RAND report is the result of a survey of the IC and other research to discover what constitutes intelligence analysis and how is it performed. The researchers found that "analysis" covers a range of activities that varies from organization to organization. The report concludes that to foster collaboration and shared understanding, common tools, agendas, and education curriculums should be established and shared across the community.

Treverton, Gregory F., and Jeremy J. Ghez, ***Making Strategic Analysis Matter***, Santa Monica, California: RAND Corporation, 2012, http://www.rand.org/content/dam/rand/pubs/conf_proceedings/2012/RAND_CF287.pdf
This RAND report is the result of a workshop that found that though there is not much demand for strategic analysis from policy and decision makers, there is substantial value in conducting this level of analysis.

A8.4. Analysis Scenarios and Historical Applications. Bruce, James B., and Jeffrey Martini, ***Whither Al-Anbar Province? Five Scenarios Through 2011***, Santa Monica, California: RAND Corporation, 2010, **http://www.rand.org/pubs/occasional_papers/OP278.html**

This report produced for the Marines by RAND analyzes the question, 'what does the future hold for Iraq's al-Anbar province?' The researchers play through five scenarios. The report concludes that the U.S. (and specifically the Marines) can influence some of the drivers shaping the scenario outcomes and suggests constant course of action evaluations to identify possible and probable future trajectories.

Ehlers, Robert S., Jr., ***Targeting the Third Reich: Air Intelligence and the Allied Bombing Campaigns***, University Press of Kansas, 2009
This book highlights the cooperative intelligence elements (Royal Air Force) and bombing elements (U.S. Army Air Force) of the allied forces in Europe during World War II. The text discusses the often overlooked value added by the combined intelligence-bomber efforts in crippling the German war-making capabilities.

Fukuyama, Francis, ***Blindside: How to Anticipate Forcing Events and Wild Cards in Global Politics***, Baltimore, Maryland: Brookings Institution Press, 2007
This book discusses the value, necessity, and difficulties for foreign policy analysts to anticipate wild card events (such as, the 9/11 attacks, the rapid emergence and spread of diseases like H5NI, and the collapse of communism) in world politics. The author points out that biases and political pressures often influence the prediction and likelihood assessments of these types of events. Additionally, the credibility of some assessments for the probability of these "wild cards" is questionable, with a "boy that cried wolf" tainted view.

Neustadt, Richard E., and Ernest R. May, ***Thinking in Time: The Uses of History for Decision-Makers***, 1st edition, New York: Free Press, 1986
This book provides methods decision-makers and analysts can apply from historical lessons to current decisions.

Taleb, Nassim Nicholas, ***The Black Swan: The Impact of the Highly Improbable***, 2nd edition, Random House Trade Paperbacks, 2010
This book defines and discusses "black swan" events. The author highlights the importance of considering black swans when conducting analysis and making judgments. Although rare, black swan events have occurred and may occur, with far reaching and dramatic consequences.

Vertzberger, Yaacov, ***Risk Taking and Decision Making: Foreign Military Intervention Decisions***, Stanford University Press, 1998
This book discusses the realities of risk and provides analysis of what elements impact risk judgments and preferences in individuals' decision-making. The author uses five case studies to illustrate the calculations and consequences of risks in military interventions.

Walton, Timothy, ***Challenges in Intelligence Analysis: Lessons from 1300 BCE to the Present***, Cambridge University Press, 2010

This work provides short, critical analyses of past scenarios that successfully or unsuccessfully employed intelligence analysis.

A8.5. Analysis Education and Training. Center for the Study of Intelligence, *The Future of Higher Education: Implications for Intelligence*, March 2015

This paper argues that because education models in formal education institutions have and continue to change, methods for training in the workplace must also change and adapt for new generations' learning styles.

Chang, Welton, and Philip E. Tetlock, *Rethinking the Training of Intelligence Analysts*, Taylor & Francis, 29 February 2016, http://www.tandfonline.com/doi/pdf/10.1080/02684527.2016.1147164#.V6SgAqpf3xg

This article discusses the continuing challenge of erroneous and/or incomplete intelligence assessments in the IC. The authors advocate for new training approaches for intelligence analysts that adopt a scientifically validated process, which regularly reevaluated against benchmarks.

A8.6. Deception Analysis. Barton Whaley, *Textbook of Political-Military Counterdeception: Basic Principles & Methods*, National Defense Intelligence College, 2007

This is a textbook on counterdeception. It is designed to help users think like a detective in employing analytical skills.

Godson, Roy, and James J. Wirtz, *Strategic Denial and Deception: The Twenty-First Century Challenge*, Transaction Publishers, 2008

This book considers whether globalization, proliferating communication technologies, and the dissemination of vast amounts of information make effective foreign denial and deception more or less likely.

Gooch, John, and Amos Perlmutter, *Military Deception and Strategic Surprise*, Digital Printing, 2007

The six essays in this book deal primarily with the theory of deception and strategic-level deception. They present a picture of the dynamics and potential benefits of deception. Examples of operational-level deception are mentioned in some of the essays to illustrate certain points.

Latimer, Jon, *Deception in War: The Art of the Bluff, the Value of Deceit, and the Most Thrilling Episodes of Cunning in Military History, from the Trojan Horse to the Gulf War*, The Overlook Press, 2001

This work shows how simple some tricks have been, but also how technology has increased the range and subtlety of what is possible—bogus radio traffic, virtual images, even false smells. He draws examples from land, sea, and air to show how great commanders have always had, as Winston Churchill put it, that indispensable "element of legerdemain, an original and sinister touch, which leaves the enemy puzzled as well as beaten."

A8.7. Analysis Policy and Guidance . This list is not intended to be comprehensive but rather to highlight several key resources.

AFI 14-133, *Intelligence Analysis*, 29 March 2016

As the keystone instruction for AF intelligence analysis, this publication codifies how the Air Force conducts and presents analysis capabilities in support of Global Integrated ISR and other service core functions. It establishes the standards for AF intelligence analysis and delineates the associated roles and responsibilities of AF ISR Enterprise organizations.

AFI 14-134, *Intelligence Analysis Production and Requirements Management*, 21 June 2016

This publication provides guidance and procedures on AF intelligence analysis production and requirements management in support of internal AF requirements, as an integral complement to the IC for DIAP-focused production, and in support of the annual AFISRPoA.

Air Force ISR 2023: Delivering Decision Advantage,
http://www.defenseinnovationmarketplace.mil/resources/AF-ISR_2023.pdf
This strategic document approved by AF/A2, discusses emerging and future challenges for the AF ISR Enterprise, and focuses on how the enterprise should posture to addresses these challenges while meeting enduring core missions.

Annex 2-0, ***Global Integrated Intelligence, Surveillance, and Reconnaissance***, 29 January 2015
The annex serves as an AF supplement to JP 2-0 and covers AF specific topics and perspectives on GIISR.

Commander ACC, ***GIISR Core Function Concept***, 23 Jan 2013
This document identifies five enduring core GIISR capabilities that directly support the JCA of Battlespace Awareness. Analysis is an essential and integral component of each of the five enduring capabilities.

DoDI 3115.17, ***Management and Oversight of DoD All-Source Analysis***, November 16, 2016
This instruction establishes DoD policy and assigns responsibilities for the management and oversight of DoD ASA. It also establishes the DIAAE BOG, an intergovernmental committee as the primary forum for DoD-wide analytic synchronization and integration.

ICD 203, ***Analytic Standards***, 2 January 2015
This directive establishes common analytic standards to be used across the IC to ensure clear communication among organizations.

ICD 204, ***National Intelligence Priorities Framework***, 2 January 2015
This directive establishes the NIPF as the mechanism to create, prioritize and share intelligence priorities.

ICD 206, ***Sourcing Requirements for Disseminated Analytic Products***, 22 January 2015
This directive establishes the sourcing information that must be included in covered analytic products so as to increase the credibility and transparency of intelligence analysis.

ICD 501, ***Discovery and Dissemination or Retrieval of Information within the Intelligence Community***, 21 January 2009
In pursuit of a culture of responsible sharing and collaboration across the IC, this directive establishes guidance and policies for the discovery, dissemination or retrieval of intelligence and intelligence-related information collected or analysis produced by the IC.

JP 2-0, ***Joint Intelligence***, 22 October 2013
This publication addresses the nature of intelligence and establishes the principles of joint intelligence. It is one of the base guiding documents for DoD IC organizations.

PREFACE

This publication describes the processes. procedures. and techniques used to produce all-source intelligence. It focuses on intelligence production at echelons at corps and below and amplifies the doctrine contained in FM 34-1. It provides guidance for intelligence staff officers, warrant officers. NCOs, and intelligence analysts at all skill levels. it is designed for use by the active Army and reserve components (RC).

This publ ication implements international standardization agreement (STANAG) 2077 and quadripartite agreement 511. it is in compliance with STANAGS 1059, 2033, 2044, 2149, 6004, and 6010: quadripartite agreements 170, 295, 354, 492, 523, 528, and 593; and air agreement 101/3D. The proponent of this publication is Headquarters, United States Army Training and Doctrine Command (HQ TRADOC), Submit changes for improving this publication on DA Form 2028 (Recommended Changes to Publications and Blank Forms) and forward it to the Commander, US Army Intelligence Center and School (USAICS), ATTN: ATSI-TD-PAL, Fort Huachuca, Arizona 85613-7000.

CHAPTER 1

THE INTELLIGENCE MISSION

Intelligence is a key element of combined arms operations. It enables commanders to use their combat power effectively to win the decisive battles and it helps them identify and attack high payoff targets (HPTs). Intelligence is an important part of every combat decision.

The dramatic improvements in intelligence collection systems have greatly enhanced the availability of battlefield information from many different sources. Battlefield information, however, is of limited value until it has been analyzed, Through analysis, this information becomes intelligence. The intelligence analyst integrates the seemingly insignificant bits of information from multiple sources to produce an overall picture of the battlefield. This picture reduces the uncertainties about the battlefield and the situation. Analysis generates the intelligence the commander needs to successfully fight on the modern battlefield.

This chapter describes the commander's intelligence requirements. It describes how these requirements are generated and the factors that affect them. It addresses those elements within the intelligence and electronic warfare (IEW) system that plan, coordinate, and execute intelligence analysis operations.

THE AIRLAND BATTLE

Intelligence is a vital part of the AirLand Battle. AirLand Battle is the current US Army doctrine for fighting in a mid- to high-intensity conflict. It is an extended, integrated battle involving the use of all available air and land forces. It is extended because the battle is fought from the forward edge of the area of operation (AO) to the rear boundary as a single, continuous battle (deep, close, and rear operations) . It is integrated in that nuclear and chemical weapons, when released by the national command authority, are merged with electronic and conventional weapons in all operations.

AirLand Battle Doctrine is offensively oriented. Its success depends on the ability of friendly forces to take the initiative from the enemy and to carry the fight into the enemy's rear. The simultaneous attack of forward enemy forces and the deep attack of follow-on echelons is inherent in the battle. Its objectives include the diversion, delay, destruction, or attrition of enemy fol low-on echelon forces before they can take part in the close operation. Figure 1-1 shows a sample deep attack.

The commander orchestrates a combination of offensive and defensive operations to defeat the enemy and gain the initiative. The commander uses defensive and offensive operations to destroy enemy first-echelon forces and deep-attack to simultaneously delay, disrupt, and manipulate enemy follow-on forces. The commander anticipates, creates, and exploits windows of opportunity, using flexible battle planning, to gain the initiative through offensive operations. By effectively employing maneuver and fire support assets, manipulating the enemy, and expertly

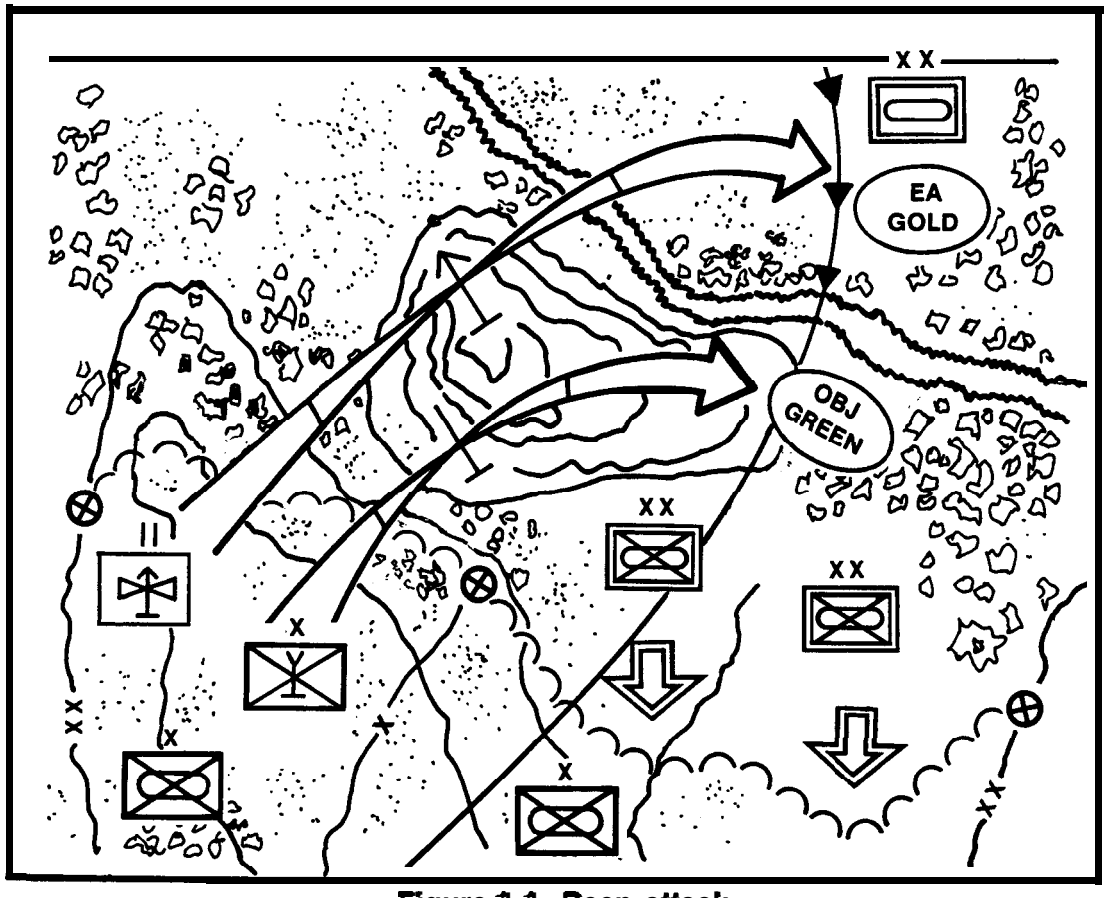

Figure 1-1. Deep attack.

using the weather and the terrain, the friendly commander can successfully defeat a superior enemy force.

To gain the initiative, the commander must--

- See the enemy early and determine the capabilities and intentions of the enemy.
- Find and track enemy follow-on echelons.
- Identify enemy high-value targets (HVTs), targets which if successfully attacked, will contribute to the degradation of important enemy battlefield functions,
- Identify, locate, and develop the required targeting data for the attack of HPTs, which if successfully attacked, will contribute to the success of friendly plans.
- Detect enemy weaknesses and develop the necessary data to support the exploitation of these weaknesses.

- Effectively use electronic warfare (EW) to support the AirLand Battle while protecting friendly use of the electromagnetic spectrum.

- Determine the enemy's capability and guard against that capability.

- Protect friendly forces and operations from enemy intelligence collection operations.

- Use the weather and terrain to friendly advantage.

IEW support is vital to the successful planning and execution of the AirLand Battle at all echelons. Intelligence support at brigade and battalion levels focuses primarily on the close operation, while at division it focuses on both close and deep operations. Corps is the focal point for intelligence operations that support rear and deep operations.

Intelligence support of close operations supports the commander's risk analysis and consideration of mission, enemy, terrain, troops available, and time (METT-T). As such it must be the first step in planning. Intelligence operations reduce risk by identifying the enemy's most likely courses of action, and so al low the commander to concentrate or disDerse forces as appropriate. Intelligence also provides administrative and logistic personnel, engineers, air detense artillery (ADA) staffs, and other planners with guidelines about the expected situations and enemy so they may make the best use of scarce assets.

To conduct deep operations the intelligence system supports the . . commander's need to look deep, find and follow enemy follow-on forces, and detarmine their capabilities, vulnerabilities, and intentions. The commander must designate the HPTs and decide where and when to attack them to achieve the greatest benefit to the operation. The commander conducts deep attacks against designated HPTs to '"shape'" the battlefield by forcing the enemy commander to deviate from established plans and to create favorable conditions for friendly commanders conducting close operations. To facilitate deep operations, corps-level intelligence planning must focus its attention on analyzing and estimating enemy capabilities, intentions, and likely courses of action at least 72 hours in advance. At division-level, intelligence planners must perform this same function at least 24 hours in advance.

Intelligence support of rear operations supports the commander's need to identify enemy capabilities, intentions, and likely courses of action to interdict friendly combat support (CS) and combat service support (CSS) functions, and to inhibit the ability of the friendly commander to flexibly employ the reserves. The intelligence planner must consider all means and measures available to tha enemy, to include sabotage, unconventional warfare, airmobile or airborne assaults, nuclear, chemical, and conventional long-range strikes, deception, and the employment of maneuver forces in deep exploitation or raiding operations.

THE BATTLEFIELD AREA

Commanders consider the battlefield in terms of the time and space necessary to defeat an enemy force or complete an operation before the enemy can reinforce. They view the battlefield as having two distinct areas: the AO and the area of interest (AI).

The AO is that portion of an area of conflict necessary for military operations. The AO is assigned by the next higher commander and designated by lateral and rear boundaries. It carries with it the authority and responsibility to conduct operations therein. The commander must coordinate with adjacent commanders before conducting maneuver and fire support (FS) activities outside the designated AO.

The AI is that area of concern to the commander which includes the AO and areas adjacent thereto. It includes areas forward of, and to the flanks and rear of the AO. It encompasses areas either occupied by enemv forces that could jeopardize friendly mission accomplishment and/or which includes the objectives of friendly current or planned operations.

Each commander determines his own AI. The commander generally relies on higher headquarters and adjacent units to provide information and intelligence about enemy forces in that area. Figure 1-2 shows the battlefield areas of division.

Battlefield areas are important to the intelligence analyst because they help focus the information requirements of commanders concerning the weather, terrain, and enemy forces from battalion to echelons above corps (EAC). Specific information requirements are dependent on the mission and the tactical situation. Usually, in conventional operations, information requirements (IR) on enemv forces are based on the one-up and two-down formula. Commanders require detailed information about enemy forces at their equivalent levels of command as well as at one level above and two levels below their own. For example, brigade commanders need information about enemy regiments (equivalent level), enemy divisions (one-up), and enemy battalions and companies (two-down). Generally, the enemy forces of concern to each commander are found within the command's AO and AI.

The IEW mission includes four major tasks: situation development, target development, EW, and counterintelligence (CI).

Situation development (discussed in Chapter 6) provides commanders with the intelligence they need to make sound tactical decisions. It is a continuing estimate of the situation that projects enemy intentions and the effects of the weather and terrain. Situation development helps cormnanders--

- Find and follow enemv forces.
- Determine enemy capabilities, vulnerabilities, and intentions.
- Identify the enemy main effort.

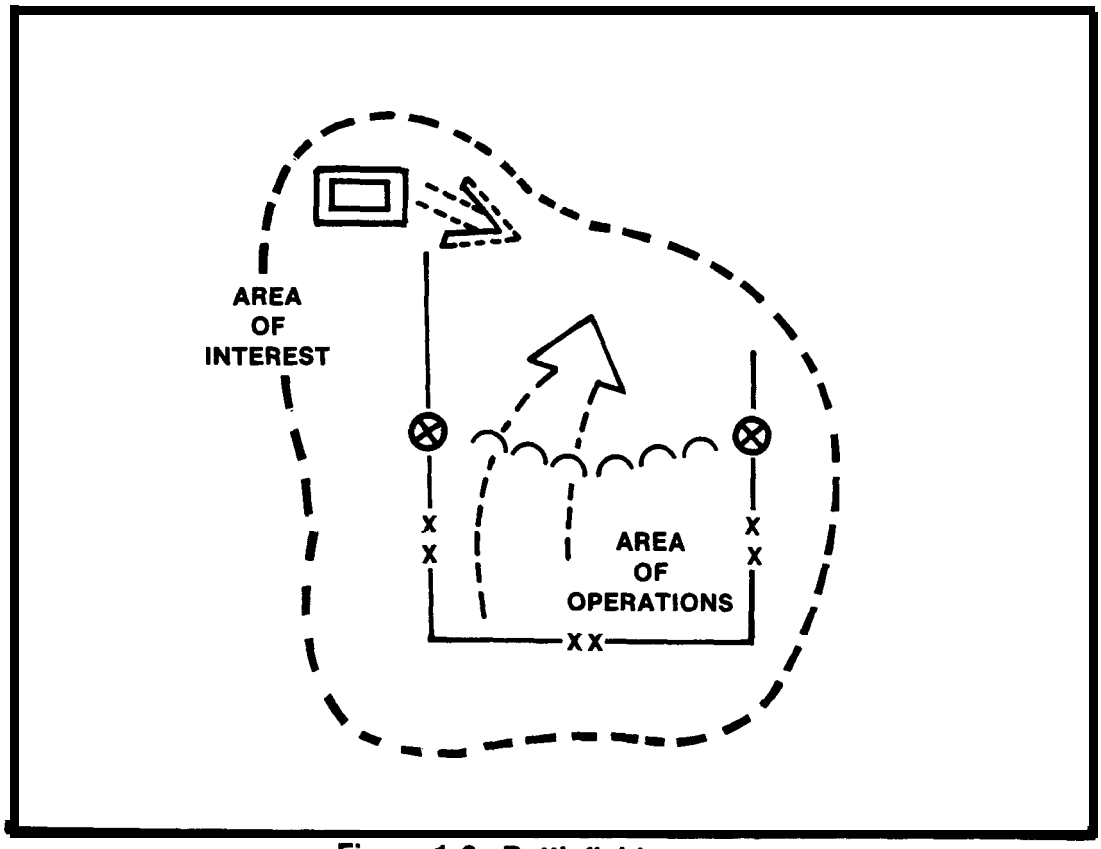

Figure 1-2. Battlefield areas.

- Determine how the weather and terrain will affect friendly and enemy operations.
- Detect opportunities to exploit enemy weaknesses and seize or retain the initiative.
- Assess the relative value of enemy combat systems, which serves as a basis for selecting HVTs.

Target development (discussed in Chapter 7) provides combat information, targeting data, and correlated target information which support the commander's tactical plans. It focuses on HPTs which have been selected, through the targeting efforts of the G2 or S2, the G3 or S3, and the fire support element (FSE), and approved by the commander. Target development identifies, locates, and tracks HPTs until thev are neutralized. Target development operations must provide sufficiently accurate targeting data to attack by fire, maneuver, or electronic means.

Situation and target development provide the intelli gence required to fight the AirLand Battle. Both are distinct tasks, but are interrelated and totally integrated to provide an accurate picture of the battlefield.

EW (discussed in Chapter 8) exploits, disrupts, and deceives the enemy command and control (C^2) system while protecting friendly use of communications and non-communications systems. It is a significant force multiplier when integrated and employed with fire and maneuver. EW consists of the following functions:

- EW support measures (ESM), which provide commanders the capability to intercept, identify, and locate enemy emitters.
- Electronic countermeasures (ECM), which provide commanders the capability to disrupt enemy use of the electromagnetic spectrum.
- Electronic counter-countermeasures (ECCM), which are used to protect friendly command, control, and communications (C^3) systems against enemy radioelectronic combat (REC) activities.

CI (discussed in Chapter 9) includes specific actions which support the protection of the friendly force. Enemy commanders, to succeed against friendly forces, must employ all-source intelligence systems to collect information about friendly forces. Depriving enemy commanders of vital information about friendly forces is crucial to friendly success on the battlefield. CI enhances the operations security (OPSEC) of the command by supporting the following actions:

- Countering the hostile intelligence threat.
- Safeguarding the command from surprise.
- Deceiving the enemy commander.
- Countering enemy sabotage, subversion, and terrorism.
- Developing essential elements of friendly information (EEFI).

THE INTELLIGENCE ANALYSIS SYSTEM

The intelligence analysis system is a single, integrated system that extends from battalion level to national agencies. Figure 1-3 shows the all-source intelligence system.

The system includes the directors, coordinators, producers, and executors. All are linked together both laterally and vertically to ensure a coordinated and effective effort. Figure 1-4 shows the common IEW structure.

Analysis elements are the heart of the intelligence system. They include--

- Intelligence officers and their staff sections.
- Echelons above corps intelligence centers (EACICs).

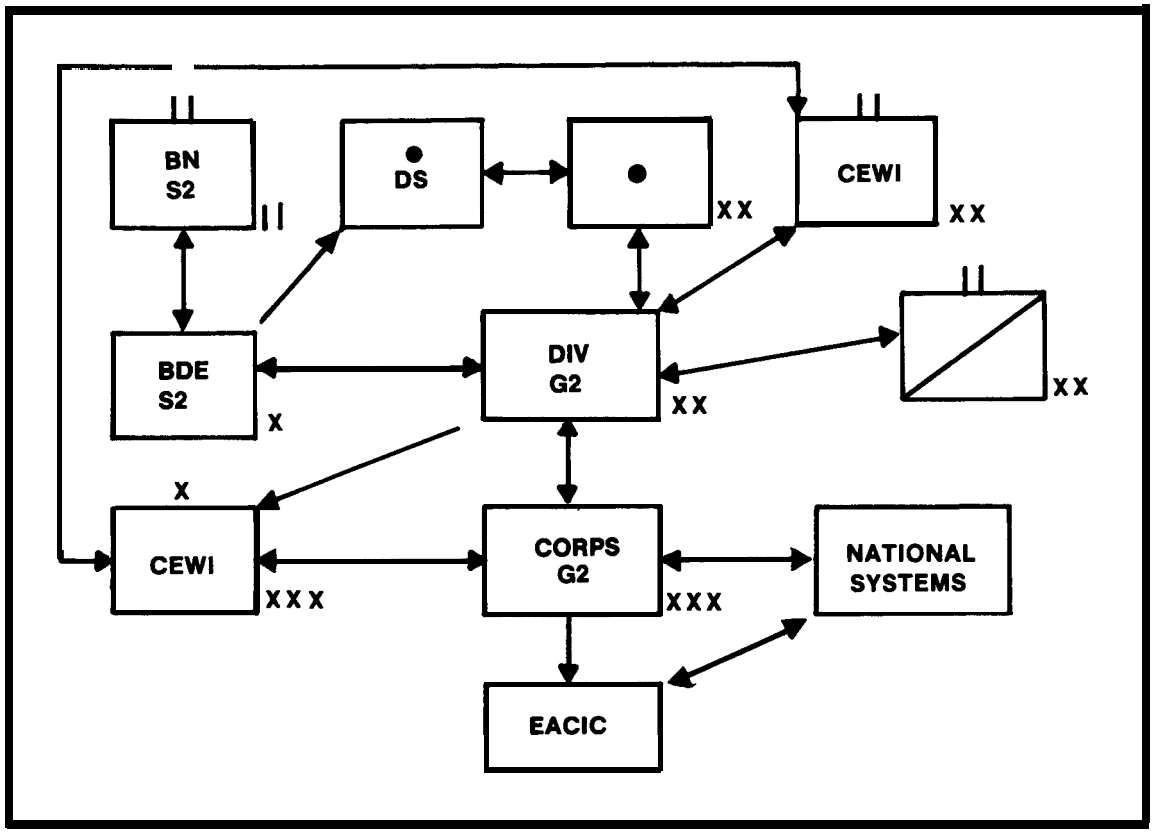

Figure 1-3. All-source intelligence system.

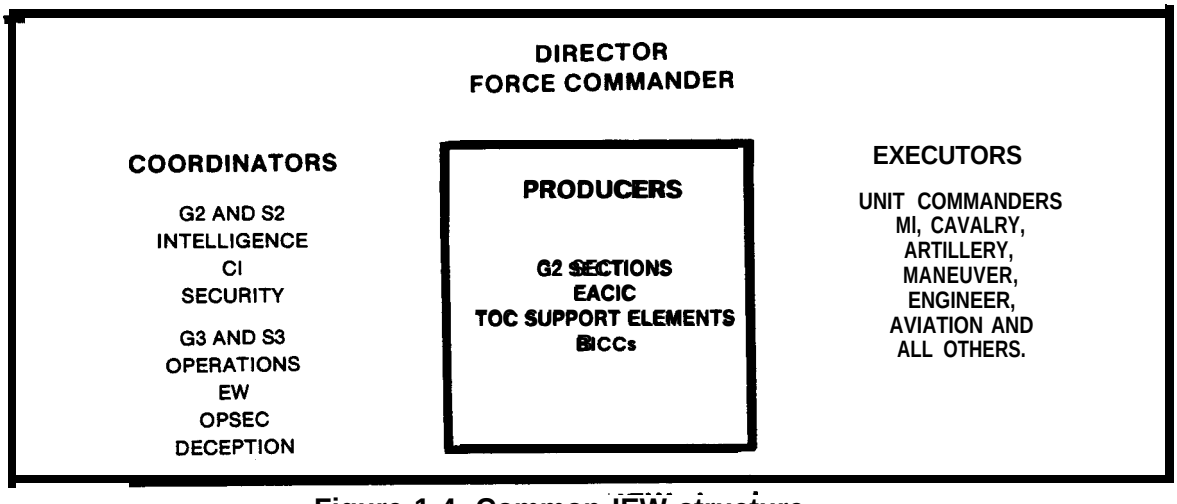

Figure 1-4. Common IEW structure.

- Tactical operations center (TOC) support elements at division and corps levels.

- Technical control and analysis elements (TCAEs) organic to military intelligence (MI) combat electronic warfare and intelligence (CEWI) battalions at division-level and MI CEWI brigades at corps-level.

- Battlefield information coordination centers (BICCs) at maneuver and artillery battalions and brigades.

INTELLIGENCE DIRECTOR, COORDINATORS, AND PRODUCERS

The intelligence director (commander), coordinators (staff), and producers (such as EACICS, TOC support elements, TCAEs, and BICCs) play the major roles in intelligence analysis.

Commander

The commander plays a critical role in intelligence analysis. The commander determines what intelligence is needed to plan and execute an operation. The commander provides guidance to the staff to ensure that the analysis effort is integrated with the other functional systems of the command and that it is focused on critical requirements and priorities. The commander, with the intelligence and operations staffs, accomplishes the planning, directing, guiding, and decision making that generate intelligence analysis and keep it going. The commander approves or modifies the priority intelligence requirements (PIRs) recommended by the G2.

Staffs

While the commander approves the PIR for the command, every staff officer in the command needs intelligence to support the functions under their staff responsibilities. However, the staff officers that are most invoived with intelligence requirements are the G2 or S2, the G3 or S3, and the FS coordinator (FSCOORD).

G2 or S2. The G2 or S2 manages intelligence operations. This officer is responsible for intelligence production and for determining the enemy's intentions. The G2 or S2 recommends PIR, based on the commander's guidance and concept of the operation. The officer manages the collection effort, supervises al i-source analysis, and ensures that combat information and intelligence are disseminated rapidiy. The G2 or S2 deveiops the intelligence estimate. The officer ensures a team effort in planning, supervising, and executing iEW operations within the command.

G3 or S3. Second only to the commander, the G3 or S3 is the primary user of intelligence. As the principal planner and coordinator of unit operations, this officer relies heavily on intelligence support. The operations officer compietes the estimate of the situation and recommends which friendly courses of action are feasible and which should be adopted. These estimates are based on the METT-T, of which a major part

is provided by intelligence. The G3 or S3 IRs are the same as, only more detailed than, those of the commander. The operations officer plays a key role, in conjunction with G2 or S2, in developing and recommending the PIR.

The G3 or S3 also has staff responsibility for EW, OPSEC, and battlefield deception (BAT-D). This officer relies on intelligence to plan and coordinate each of these functions.

Fire Support Coordinator. The FSCOORD plans and coordinates FS. This officer needs intelligence for FS targeting and target development. The FSCOORD, G2 or S2, and G3 or S3 coordinate very closely in selecting HPTs and developing targeting data for attacking HPTs.

Tactical Operations Center Support Elements

The TOC support elements provide dedicated intelligence support to the G2 or S2. TOC support elements, which are assigned to the headquarters and headquarters company (HHC) of the division, or the operations battalion of the corps MI brigade, perform intelligence collection management (CM), analysis, and dissemination functions. The all-source production section (ASPS) or equivalent element within the TOC support element performs intelligence analysis. Other TOC support element sections are collection management and dissemination (CM&D) and CI analysis, which support the G2: and the EW and OPSEC staff elements, which support the G3. There is also an informal targeting team formed in the DTOCSE and CTOCSE to assist in the targeting effort.

The ASPS works under the staff supervision of the G2 or S2. It develops and maintains the intelligence data base. It develops intelligence from unprocessed information and other intelligence products. It performs IPB, assists the G2 or S2 in developing the intelligence estimate, and develops the analysis of the battlefield area. It also develops situation and targeting data to support maneuver, fire, and other battlefield functions. Each ASPS coordinates with other TOC support elements to ensure that all available data is evaluated and to exchange analysis approaches, techniques, and ideas for solving common intelligence problems.

Technical Control and Analysis Element

The TCAE, in addition to managing the signals intelligence (SIGINT) collection and EW assets, performs SIGINT analysis for the command. It maintains the enemy electronic order of battie (EEOB) and technical data bases. It analyzes and correlates ESM and SIGINT data from all sources to update the EEOB and technical data bases needed to produce SIGINT. It passes SIGINT data to the ASPS for correlation with information and intelligence from other sources.

Battlefield Information Coordination Centers

The BICCs are organic to maneuver brigades, battalions, and other support units. They consist of analysts who operate within their unit

TOCS as an integral part of the S2 section. They provide an organic intelligence management, production, and dissemination capability. BICCs vary in the size and type of support they provide, For example, maneuver unit BICCs concentrate on both situation and target development, while artillery unit BICCs are almost exclusively interested in target acquisition (1A) and development.

INTERACTION OF ANALYSIS ELEMENTS

Close coordination and interaction between analysis elements make the system function effectively. Analysis elements at all echelons exchange requirements, information, and intelligence both laterally and vertically throughout the system. At the same time they disseminate combat information and intelligence to maneuver, FS, and other units that need it.

CHAPTER 2

THE INTELLIGENCE CYCLE

Intelligence operations follow a four-phase process known as the intelligence cycle. The intelligence cycle is oriented to the commander's mission. Supervising and planning are inherent in all phases of the cycle. Figure 2-1 shows the intelligence cycle.

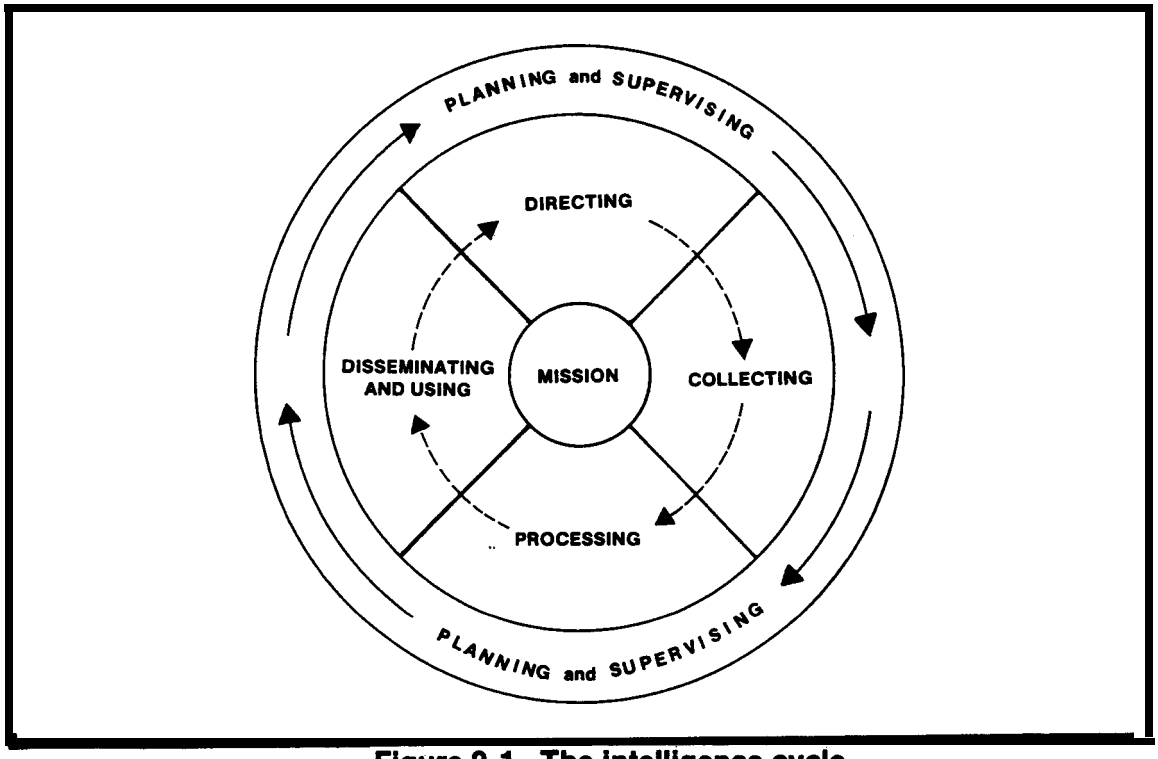

Figure 2-1. The intelligence cycle.

The intelligence cycle is continuous. Even though the four phases are conducted in sequence, all are conducted concurrently. While available information is processed, additional information is collected, and the intelligence staff is planning and directing the collection effort to meat new demands. Previously collected and processed information (intelligence) is disseminated as soon as it is available or needed.

This chapter describes the procedures outlined above and the processing phase of the intelligence cycle.

DIRECTING

The intelligence effort begins by determining requirements, establishing their priorities, and communicating information or intelligence collection orders (to subordinate elements) and requests (to

higher and adjacent units). This is accomplished by the commander and the intelligence and operations staff. Sources of information or intelligence requirements include the following:

- Commander's planning guidance, concept of the operation, and stated requirements.
- METT-T analysis by intelligence and operations staffs.
- Requests for intelligence information (RIIs) from higher, adjacent, allied, and subordinate units and elements, and from other staff elements within the command.

The highest or most important IRs are designated as PIRs. The commander chooses PIRs based in part on the recommendation of the G2 or S2. PIRs are those intelligence requirements for which a commander has an anticipated and stated priority in the task of planning and decision making. However, an excessive number of PIRs degrades efforts to focus relatively scarce intelligence collection resources on the most essential intelligence requirements.

IRs are those items of information regarding the enemy and the environment needing collection and processing to meet the intelligence requirements of the commander. IRs can either support PIRs or be stand-alone requirements of a lesser priority than PIRs. Both PIRs and IRs serve as the basis for collection and intelligence efforts.

Intelligence analysts in the ASPS advise the G2 regarding the PIRs and IRs. They analyze METT-T factors and the commander's guidance and concept of the operation to determine what intelligence and information is needed. The ASPS reviewa the existing data base to identify information that is already available and that which must be acquired. They pass requirements for new information to the CM&D section as additional collection requirements. Figure 2-2 shows the directing phase from the commander's intent to the commander's requirements.

COLLECTING

Based on requirements, the CM&D section manages the collection effort. The CM&D section develops a collection plan that is keyed to the PIRs and IRs. It continuously updates the collection plan as the situation changes.

The ASPS assists the CM&D section in planning and supervising the collection effort. The ASPS helps convart intelligence requirements into specific information requirements (SIR). SIR are keyed to indicators (see Appendix C) which when integrated with other indicators and factors present on the battlefield may provide clues to the enemy's most probable course of action. The ASPS monitors incoming reports, advises the CM&D section when PIR or IR are satisfied, identifies naw requirements, and determines when previously requested information is no longer needed.

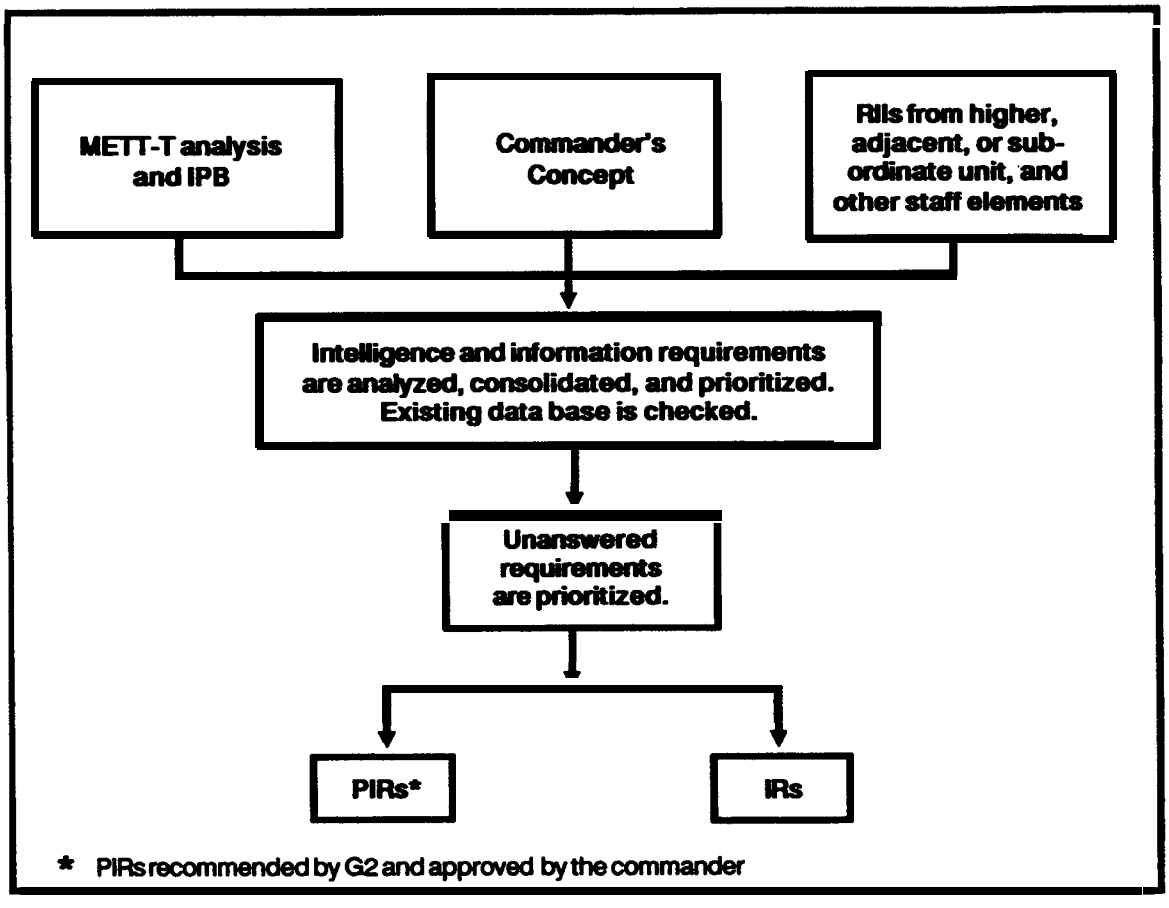

Figure 2-2. Commander's requirements and guidance.

Collection operations generate information from various sources. This information is fed into the ASPS. The ASPS--

- Reports combat information immediately.
- Processes information to develop the intelligence needed for tactical decisions and targeting.

PROCESSING

Processing is the phase in the intelligence cycle in which information becomes intelligence. It consists of three operations:

- Recording. Recording is the reduction of information to writing or some other form of graphical representation and the arranging of this information into groups of related items.

- Evaluation. Evaluation is the determination of the pertinence of information to the operation. reliability of the source or agency, and accuracy of the information.

- Analysis. Analysis is the determination of the significance of the information. relative to information and intelligence already known, and drawing deductions about the probable meaning of the evaluated information.

Processing is a continuous operation. The analyst processes new information as it is received without waiting for additional information. Intelligence derived from fragmentary information is essential, particularly during fast-moving operations or when the information concerns an HPT. Normally there is a time lag between the time an enemy target presents itself and the time the information becomes available to an element that can react to it. Complete information about a target or a situation is seldom available. The analyst continuously identifies information gaps and attempts to acquire information to complete, confirm, or refute fragmentary information. This information must assist the corrmander to generate and apply combat power. It helps the commander to strike critical units or areas, and to achieve and retain the initiative. Figure 2-3 shows information processing.

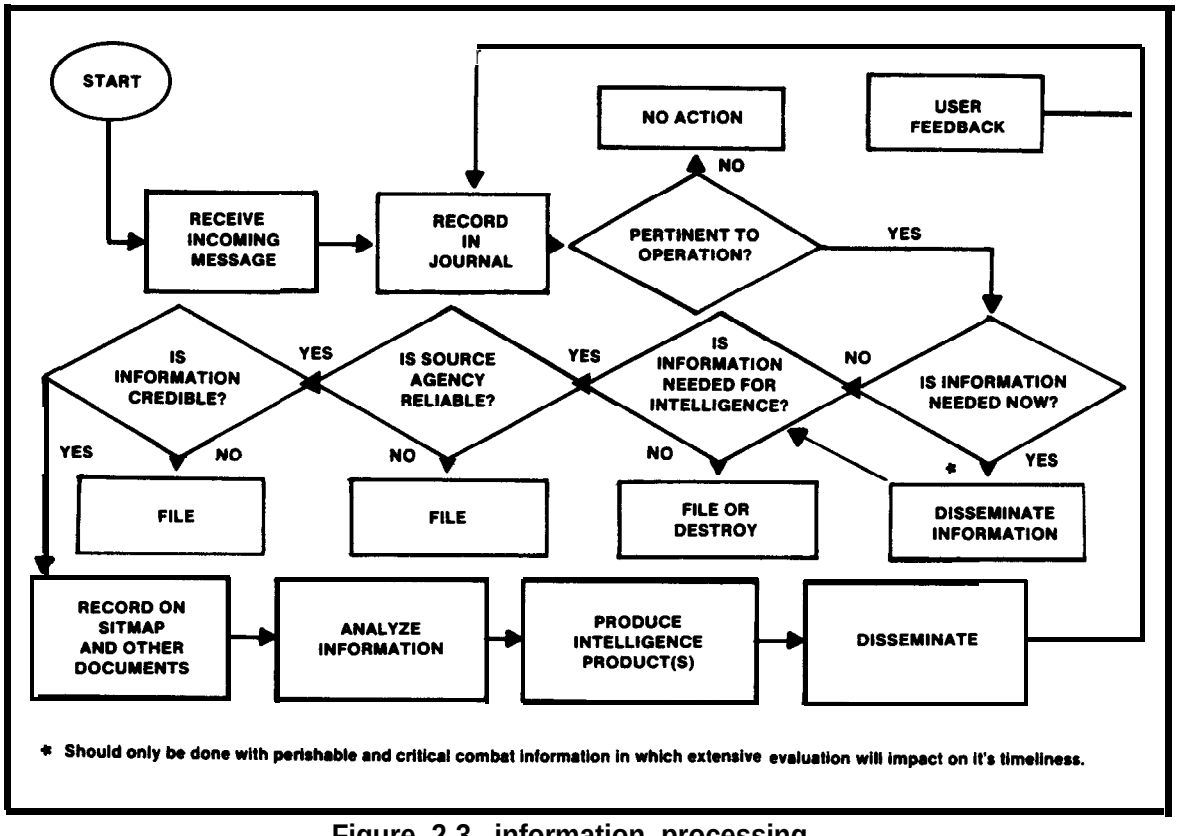

Figure 2-3. information processing.

The sequence for processing varies with the nature and urgency of the information. Information is normally recorded first: however, if it contributes to the development of urgent intelligence, it is recorded simultaneously with or after evaluation and analysis. Combat information or partially developed intelligence that is needed immediately is disseminated before it is completely processed. Information that is not of immediate value is processed before it is disseminated.

Evaluation and analysis may occur simultaneously followed by immediate dissemination. For example, information from a reliable source may indicate that the enemy is about to launch a major attack, In this case, recording is of secondary importance, and the intelligence report that an attack is imminent is disseminated as soon after receipt as possible.

Reporting of information to higher and lower echelons occurs concurrently with processing, For example, to speed target execution time of HPTs, a commander orders lower headquarters to report all information concerning specified enemy units, areas, or activities before the processing cycle is complete. Lower headquarters make similar requests of higher headquarters,

A sound collection program that effectively uses collection assets results in a heavy volume of information. Some information may be of no use to the collecting unit, but of great value to adjacent, higher, or lower units. This includes many reports which may appear insignificant and unrelated to other information. However, when these reports are analyzed along with other available information, definitive and predictable patterns of enemy activity often emerge.

Today, most information is processed manually. Emerging automatic data processing (ADP) systems help the analyst process greater volumes of information faster and mors accurately. Appendix B describes ADP support to intelligence analysis. Developing and maintaining an intelligence data base is essential to processing. The data base is the basis for analyzing new information neaded for situation and target development as well as CM, EW, and CI operations. When possible, intelligence data bases are created for contingency areas during peacetime. Initially, data base information and intelligence are collected by researching available literature published by various agencies and sources, including the following:

- Central Intelligence Agency (CIA).
- Defense Intelligence Agency (DIA).
- National Security Agency (NSA).
- US Army Intelligence Agency (USAIA),
- Unified and specified commands.
- Theater commands.

- Allies.
- Open sources.

The analyst identifies gaps in the data base and passes requirements to the collection manager. As information is received from the various collection agencies, it is correlated with existing information in the data base to assess its significance. Combat information, often highly perishable in nature, is disseminated immediately.

RECORDING

Recording information into the data base makes evaluation and analysis easier and more accurate and facilitates preparation of intelligence reports by conveniently drawing together all available information on a specific subject. The recording means used must be adequate to handle the volume of information and intelligence received and to serve the needs of those who must have access to it. Means and techniques of recording must permit timely dissemination of information and intelligence.

Recording is more complex at higher command echelons. At division level and above, ADP systems assist in the recording function. Some of the more common recording devices are listed below. Others are used when required.

- Intelligence journal.
- Intelligence files.
- Situation map (SITMAP).
- Intelligence workbook.
- Coordinate register.
- Order of battle (OB) records.

Intelligence Journal

The journal is an official, permanent, and chronological record of reports and messages that have been received and transmitted, important events that have occurred, and actions taken in response. Accuracy and completeness are essential , since various elements of the headquarters will refer to it later. It covers a specified time period, usually 24 hours. Journal entries should reflect--

- An accurate and concise statement of the message, report, or event.
- A notation about the sender or individual making the report, to include unit duty position and section: for example, S3 1/60 Infantry Battalion.

- The time of receipt or dispatch and method of transmission.

- Action taken as a result, to include dissemination given to reports, other information received, and other internal G2 recording (workbook, SITMAP),

Journal entries are concise and record the time and essential facts. As a minimum the journal entries include--

- Purpose, subject, and conclusions of conferences.

- Command decisions and summarizations of plans.

- Movements of enemy units, one echelon above and two echelons below your own level,

- Significant messages (radio, radio teletypewriter (RATT), hard-copy, overlays, photos, and any other verbal or written reports) transmitted and received.

- Incidents of enemy activity.

- Friendly patrol activity.

- Liaison activities.

- Changes in personnel within the staff section.

- Summaries of written messages and orders.

- Summaries of action based on enemy and friendly activity.

Figure 2-4 shows a partially completed intelligence journal (DA Form 1594).

Intelligence Files

Intelligence files permit ready access to all available information. The files most commonly maintained are the journal file, reference file, and OB file.

Journal File. The journal file contains all previously recorded journal sheets and supporting materials. Supporting material referenced on the journal sheet is filed in chronological sequence. It includes copies of orders, periodic reports, messages, memoranda, conference notes, map overlays, and other material required to support the journal entries. The journal number is annotated on the supporting document. The unit SOP normally describes procedures for maintaining a journal. One good method is to begin the annotation with the letter "J," followed by the date and an entry number. The fifth entry on June 23d would read "'J-23-05."

DAILY STAFF JOURNAL OR DUTY OFFICER'S LOG
For use of this form, see AR 220-15: the proponent agency is Office of The Deputy Chief of Staff for Operations & Plans.

Reference File. The reference file includes all information that is not of immediate interest but may be of future value. Information is cross-indexed to permit easy retrieval.

OB File. The OB file is discussed in Chapter 3.

Working Situation Map

The working situation map (SITMAP) is the primary analytic tool at all echelons. It is a temporary graphic display of the current dispositions and major activities of the enemy. Information about friendly forces on this map usually is limited to boundaries; locations of command posts (CPs) of higher, lower, and adjacent units; reconnaissance units; the forward edge of the battle area (FEBA), and forward line of own troops (FLOT). The level of detail of the working SITMAP will be proportionate to the echelon at which it is maintained.

Generally, enemy maneuver units are posted which are two echelons below that of the friendly unit. Enemy units, regardless of size, in our rear area are always posted because of the amount of damage they can do to administrative and logistical nodes.

Enemy headquarters (especially regimental and higher levels) and CS and CSS asset locations are also posted. The SITMAP reflects enemy unit identification, disposition, and boundaries; major roads or trails for movement of personnel, weapons, and equipment; and locations of, for example--

- Automatic weapons (battalion SITMAP only).
- Supporting mortars (battalion SITMAP only).
- Antitank guns (battalion SITMAP only).
- Artillery,
- Air defense artillery.
- Minefields.
- Roadblocks.
- Entrenchments.
- Obstacles.
- Defensive positions.
- Logistics and command facilities.
- Aircraft and helicopter staging areas.
- Nuclear, biological, and chemical (NBC) contaminated areas.

- Ground surveillance devices.

- Smoke screens.

When plotting enemy activities and dispositions, indicate the latest time at which the activity was observed or the disposition confirmed. The S2 ensures that the working SITMAP and supporting overlays are maintained as simply as possible and that authorized conventional signs, mil itary symbols and abbreviations are used. See FM 101-5-1 for authorized abbreviations and map symbols. Explain any deviations from these symbols in the marginal data on the map or overlay, Necessary classification markings also must appear in the margins of maps and overlays.

Rather than attempting to plot all entries on a map by means of conventional or Improvised military symbols, the S2 uses a number or letter to plot the area where the activity was observed. A corresponding letter or number then is entered into a space alongside the map and a notation entered as to the activity observed. Use a number or letter that is easily cross-indexed to the journal or message file for a complete report. Ensure that the number or letter indicating an activity in the journal file matches that on the working SITMAP (see "action taken" column in Figure 2-4).

Care must be taken to prevent overcrowding the map, One method of doing this is to group entries by categories on a series of acetate overlays. Use separate overlays to display separate categories of information. A typical separate overlay might show fortifications or potential targets or details of OB. An enlarged sketch map also is prepared to cover overcrowded areas. This allows the presentation of additional details.

The working SITMAP (discussed in this chapter) and the OB SITMAP (discussed in Chapter 3) are two separate items. Although the same types of information are recorded on each, their functions differ. The G2 or S2 uses the working SITMAP for recording and analyzing. The OB SITMAP normally is less cluttered than the working SITMAP.

Maintenance of the OB SITMAP at brigade and battalion levels usually is a joint S2 and S3 action. At higher levels, each section maintains a separate SITMAP. Plotting the friendly situation is the responsibility of the S3, while the enemy situation is the responsibility of the S2. During operations, personnel from either section map or plot friendly or enemy entries on the SITMAP and perform other processing functions.

When the intelligence and operations staffs use separate maps, ensure that acetate overlays are readily interchangeable between these maps. This permits easy comparison of the current enemy situation (G2 or S2 map) with the disposition of friendly forces (G3 or S3 map), and easy comparison of enemy obstacles, barriers, and minefield with planned routes of march.

Examples of separate SITMAP overlays are--

- Enemy fortifications.
- High value targets.
- Obstacles.
- OB data.
- Friendly reconnaissance patrols.
- Surveillance activities (include the ground coverage of each system).

The maintenance of the working SITMAP takes precedence over ail other recording means during combat operations. In a fast-moving situation, particularly at the maneuver battalion level, it is the oniy recording device used.

The working SiTMAP is continually purged of information that is not current or otherwise no longer needed. Purging keeps it neat and uncluttered, making it more useful as an analysis tool. Map overlay tracings or periodic photographs of the SITMAP provide a permanent record of the situation. These records provide a reference to past enemy activity and help determine patterns of enemy movement and dispositions.

Use the working SITMAP to make sound tactical decisions; its primary intelligence uses are to--

- Display the enemy disposition and situation.
- Provide a basis for comparison to determine the significance of newly received data about enemy forces. IPB situation and event templates provide a basis for comparison.
- Provide a background and basis for briefings and other required intelligence reports.
- Provide the basis for overlays which graphically portray the enemy situation.
- Assist in the determination of movement patterns of guerrilla or insurgent forces.
- Show possible intelligence gaps which require redirection of the collection effort. For example, the need to locate and identify enemy units reported for the first time.

For secondary intelligence use, post the following information in the margin of the working SITMAP or on charts or cards nearby:

- Computations of enemy personnel and weapon strengths and weaknesses.

- Organization charts of specified enemv units.
- Summaries of weather and terrain data.
- A listing of PIR and IR.
- Notations about the current patrol plan.
- Movement computations.
- A listing of friendly attachments.
- A listing of unlocated enemy units believed to be in the AO.
- Probable courses of action.
- Battle damage assessment (BDA).

Chapter 6 describes how the SITMAP is used in situation development.

Intelligence Workbook

The intelligence workbook contains information arranged by subject heading. This arrangement helps to sort, evaluate, interpret information, and prepare intelligence reports. It is not a permanent record and it is not distributed to an outside agency. The workbook is kept current with obsolete entries deleted. At higher echelons, analysts maintain separate workbooks on various subjects.

There is no prescribed format for the workbook. At division and lower headquarters, use index tabs to label information in the intelligence summary (INTSUM). At corps and higher levels, use index tabs to label information in the periodic intelligence report (PERINTREP).

Record incoming messages and reports; for example, information concerning a newly identified armor unit could be recorded under index tab 3A, NEW UNITS, as well as index tab 2B, ARMOR. A message that furnishes information on different subjects results in several entries: each entry contains only that subject information. For example, a message containing information on the locations of a reserve armor unit and an artillery unit results in extracts under item 2B, ARMOR and under 2C, ARTILLERY. Base each entry in the workbook on an incoming message and include a reference to the journal serial number of that message. For example, J2, 091200 April, from 20th Engr Cbt Bn: "Bridge at LINDEN AB 910246 destroyed by bombing. Estimated out of action for 30 hours."' The J2 refers to the journal serial number and the date-time group (DTG) entered refers to the time of occurrence of the event. The intelligence officer makes written comments on the evaluation of the information and its possible significance following the appropriate entry.

Figure 2-5 shows a sample intelligence workbook which might be used at corps and higher levels.

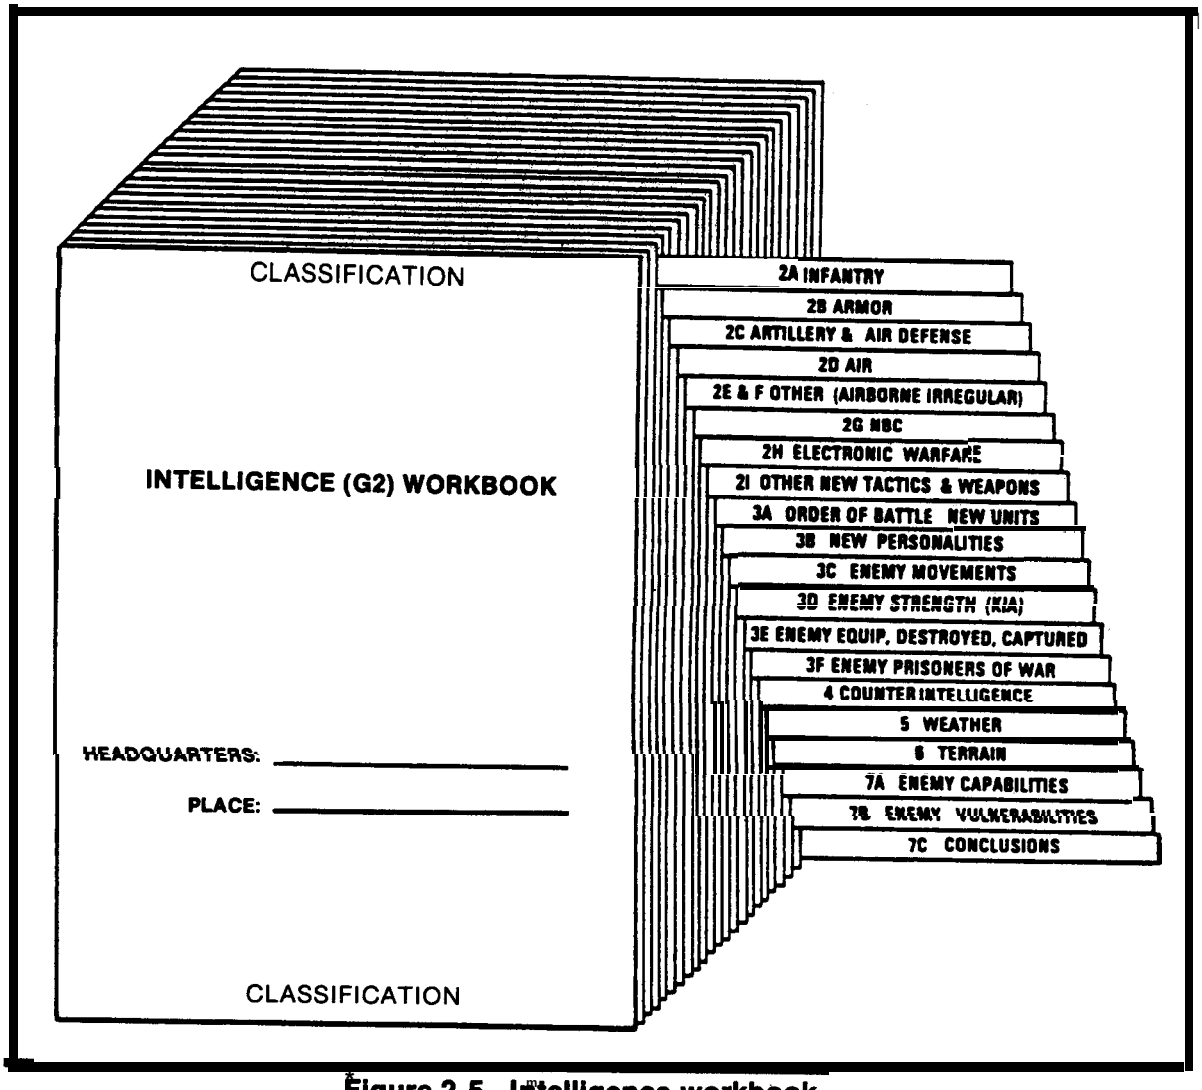

Figure 2-5. Intelligence workbook.

EVALUAT 10N

Evaluation includes determining the pertinence of information, the reliability of the source or agency through which the information was derived, and its credibility. Evaluation of information at the lower echelon is a simple step compared to the procedures employed at higher echelons. From the viewpoint of the brigade or battalion S2, information which relates to the unit's AO and AI is pertinent; information relating to areas outside the area of interest may or may not be pertinent. The brigade or battalion S2 may not be able to judge the reliability of a source because the S2 may not have repetitive contact with that source. This difference between higher and lower echelons is because information received from higher headquarters normally has been processed, evaluated, and interpreted and the information collected by organic agencies at lower

echelons generally is acquired by direct observation or actual contact with the enemy.

Pertinence

Pertinence is the examination of information to determine whether or not the information is-

- Pertinent with regard to the enemy or to the battlefield area. Information that relates to a unit's AO or AI normally is pertinent.
- Needed immediately, and if so, by whom? Of possible present or future value, and if so, to whom?

Reliability

The source of information and the agency by which it was collected are both evaluated for reliability. The principal basis for judging the reliability of a source or an agency, other than troop units, is previous experience with the source. Criteria for evaluating troop units include a knowledge of their training, experience, and past performance.

The headquarters closest to the source or agency is ordinarily the best judge of its reliability. Consequently, a higher headquarters normally accepts the reliability evaluation performed by a reporting headquarters. It does, however, consider the reliability of the reporting headquarters itself.

Credibility

Credibility means the probable truth of the information. Judgment of credibility is based on the answers to the following questions:

- Is it possible for the reported fact or event to have taken place?
- Is the report consistent within itself?
- Is the report confirmed or corroborated by information from different sources or agencies?
- Does the report agree or disagree in any way with other available information?
- If the report does not agree with information from other sources or agencies, which one is more likely to be true?

The most reliable method of judging the accuracy of a report is by comparing it with similar information which already may be available in an intelligence file or workbook. When possible, the intelligence officer obtains confirming or refuting information through different agencies and from other sources.

Marked differences in the evaluation of the accuracy of information may occur between higher and lower echelons. The reason for this difference is because higher echelons, which have more sources of information and intelligence than lower echelons, have a greater opportunity to confirm, corroborate, or refute the accuracy of reported data. Regardless of the source, reevaluate the accuracy of incoming information and intelligence at each echelon. Thus, the role of higher echelons in evaluating the credibility (or probable truth) of information differs somewhat from its role in evaluating the reliability of the source (again, usually done best by the echelon closest to the source),

The evaluation rating of each item of information is indicated by a standard system. Reliability is shown by a letter; accuracy by a numeral . The lowest headquarters possible assigns the evaluation ratings.

Indicate the reliability of the source and agency as follows:

A - completely reliable.

B - usually reliable.

C - fairly reliable.

D - not usually reliable.

E - unreliable.

F - reliability cannot be judged.

A rating of "A" indicates only the most unusual circumstances. For example, this evaluation is given when it is known that the source has long experience and extensive background with the type of information reported. A rating of "B" indicates a source of known integrity. A rating of "'F" indicates there is no basis for estimating the reliability of the source.

Agencies ordinarily are rated A, B, or C. However, when the source and the collecting-reporting agency are evaluated differently, only the lower degree of reliability is indicated.

Indicate the credibility of information as follows:

1 - confirmed by other sources.

2 - probably true.

3 - possibly true.

4 - doubtfully true.

5 - improbable.

6 - truth cannot be judged.

If it can be stated with certainty that the reportsd information originates from a source other than that for already existing information on the same subject, it is classified as "confirmed by other sources" and is rated "'l.'"

If no proof in the above paragraph can be established, and if no reason exists to suspect that the reported information comes from the same source as the information already available, it is classified as "'probably true" and is rated "2.'

If the report is confirmed in essential parts by information already available, it is classified as "probably true"' and is rated "2."

If the investigation reveals that the raported facts, on which no further information is yet available, are compatible with the previously observed behavior of the target, or if the known background of a person leads to the deduction that the person might have acted as reported, the information raceived is classified as "possibly true"' and is rated "3."

Reported but unconfirmed information, which contradicts the estimate of the development or the known behavior of the target, is classified as "doubtful" and is rated "'4'" if this information cannot be disproved by available facts.

Reported information which is not confirmed by available data and contradicts the experience hitherto assumed to be reliable with regard to the development of a target or issue is classified as "improbable" and is rated "5." The same classification is given to reported information that contradicts existing data on a subject originally given the rating "'l" or "2."

If the investigation of a report reveals that a basis for rating 1 to 5 is not given, the reported information is classified as "truth cannot be judged"' and is rated "6."

The statement "truth cannot be judged" is always preferred ovar the inaccurate use of ratings 1 to 5. If there is no sound basis for rating 1 to 5 because of the complete absence of other information on the same target, it must be rated 6.

The scale 1 to 6 does not represent progressive degrees of accuracy. Recognition must be given to the rating represented by the numeric symbol.

Although both letters and numerals are used to indicate the evaluation of an item of information, they are independent of each other. A completely reliable agency may report information obtained from a completely reliable source which, on the basis of other information, is judged to be improbable. In such a case, the evaluation of the information is A-5. A source known to be unreliable may provide raw information that is accepted as accurate information, when confirmed by reliable sources. In this case, a report is evaluated E-1. A report evaluated F-6 may be accurate and should not be arbitrarily discarded.

A report disseminated to higher, lower, and adjacent units should contain the evaluation for each item of information; for example, '"The division artillery of the enemy 46th Tk Div can fire nuclear rounds of 0.5 kt yield (C-3)."

The evaluation and interpretation of information at the brigade and battalion is a simplified mental process: thus, the standard evaluation rating has little if any application. This system assists the G2 or S2 in processing information received from other headquarters and in evaluating information disseminated to other headquarters.

ANALYSIS

The processing of information continues with analysis, which consists of three steps: assessment, integration, and deduction. It is during this phase of the intelligence cycle that information becomes intelligence.

Assessment

Assessment is the sifting and sorting of evaluated information to update significant elements with respect-to the mission and operations of the unit. The first and most important step towards proper assessment is a clear understanding of the unit's mission and the commander's intent. All information gathered is viewed in relation to what the commander wants to accomplish. Assessment also requires judgement and a thorough knowledge of military principles, the characteristics of tha AO, and the enemy situation, to include enemy doctrine and past practices.

Assessment at headquarters above division level often involves detailed research with greater difficulty caused by the increased volume of information. Regardless of the level, individuals who assess information must relate their efforts to the unit's mission to avoid wasted time and effort.

Integration

Integration is the combination of the elements isolated in assessment with other known information to form a logical picture or hypothesis of enemy activities or the influence of operational area characteristics on the mission of the command. In the process, more than one hypothesis may be formulated based upon existing intelligence.

Integration, particularly the development of hypotheses, requires the same good judgment and thorough background knowledge essential to making a good assessment. In formulating hypotheses, the intelligence officer avoids preconceived opinions and hypotheses based solely on personal experience or preference. The officer attempts to adopt the role of the enemy commander in the development of these hypotheses.

After they are formulated, all hypotheses are analyzed and tested. Analysis of an hypothesis includes determining the indications that should exist if the hypothesis is a valid one. Testing includes verifying the

existence or nonexistence of these indications within the limitations of available time and means.

Integration may be a mental process completed in a few moments or it may be a lengthy process involving the collection of a large volume of additional information.

Deduction

The last step in the analysis of information is deduction. Meaning is deduced from the hypotheses developed; these are than tested and considered valid as a result of integration. Deduction answers the question: "What does this information mean in relation to the area of operations, the enemy situation, and the friendly commander's intent?" The answer provides a useful conclusion which can serve as a basis for determining future enemy courses of action and for keeping the intelligence estimate current. Deduction should also answer the question: "What does this information mean in relation to the enemy's use of tactical deception or counterdeception?" 'The resulting answer reduces friendly vulnerability to being deceived and the false belief that battlefield deception operations are being believed by the enemy.

DISSEMINATION

The final step is to disseminate intelligence or information. Dissemination is not limited to regular reports. Critical Pieces of information are passed quickly to those who can use them. The G2 or S2 always is aware of this and prepares to use any form of communication, from RATT to courier, to pass vital reports. Intelligence is of no value on the battlefield when it becomes history.

CHAPTER 3

ORDER OF BATTLE

OB intelligence is an integral part of intelligence analysis at all levels. Intelligence analysts consider OB intelligence. They integrate it with other intelligence pertaining to weather, terrain, and other METT-T factors to determine Threat capabilities, vulnerabilities, and probable courses of action.

This chapter describes the OB analysis process and the tools used to develop and integrate OB.

OB is the identification, strength, command structure, and disposition of the personnel, units, and equipment of any foreign military force. During counterinsurgency operations, or whenever they become militarily significant, include guerilla and insurgent forces, associated agent nets, and the insurgent auxiliary and support structure in the Threat data base,

Data is developed in many fields outeide the scope of 0B, but all intelligence is related ultimately to it. For example, technical intelligence (Tl) produces intelligence on the capabilities of weapons systems, but OB intelligence determines the effect of weapon capabilities and characteristics on enemy tactics, combat effectiveness, and organization.

ORDER OF BATTLE FACTORS

The OB consists of evaluated information on enemy, allied and neutral forces, including--

- Composition.
- Disposition.
- Strength.
- Tactics.
- Training.
- Logistics.
- Combat effectiveness.
- Electronic technical data.
- Miscellaneous data.

COMPOSITION

Composition is the identification and organization of units. It appl ies to specific units or commands as opposed to type units. Unit

identification often is called the key to 0B intelligence because it leads to the answers to many questions concerning the enemy, Unit identification consists of the complete designation of a specific unit by name or number, type, relative size or strength, and (usually) subordination. Through identification, the OB analyst develops a history of the composition, training, tactics, and combat effectiveness of an enemy unit. The identification of a specific unit within an organization alerts the analyst to the possible presence of other unidentified or unlocated units of the sama organization.

Organization is the physical structure of a unit and the relationship of the various elements within the structure. Knowledge of the organization of a unit or military force aids in developing accurate intelligence on current strength, and combat efficiency. Further Threat capabilities as they relate to tactics, training, and logistics are difficult to assess accurately without knowledge of the current organizat ion.

The basic self-sufficient tactical unit (normally a combat division) is considered when developing intelligence concerning composition. In some countries, the field army is considered the basic self-sufficient tactical unit. In others, it is the regiment. The importance of this concept I ies in the term "'self-sufficient.'" Units subordinate to self-sufficient tactical units, although capable of limited independent action, cannot sustain themselves over relatively long periods of time. Subordinate units seldom are employed independently or separately from the basic self-sufficient tactical unit. For example, a new Soviet motorized rifle regiment (MRR) is reported in the AO, Knowing that the division is the Soviets' basic self-sufficient tactical unit and the three MRRs of a motorized rifle division (MRD) seldom are employed independently, the presence not only of a new regiment but of a new MRD is given tentative acceptance. When one of these regiments is located, suspect that the remaining elements of the division also are in the area.

DISPOSITION

Disposition consists of the location of Threat units and the manner in which these units are deployed tactically (or administratively in times of peace) . In addition, disposition includes the recent, current, and projected (or probable) movements of Threat units.

Location refers to a geographical area or position occupied by a unit or units. Knowledge of the strength and location of a Thraat force assists the intelligence officer in determining the capabilities of the force and its effect upon the accomplishment of the friendly mission. Data of this type is collected during peacetime and form the basis for assessing capabilities during the initial period of hostilities.

Tactical deployment is the relative position of units with raspect to one another or to the terrain. Tactical formations are designed for executing the various tactical maneuvers and usually are based upon doctrine. If this deployment is predetermined, it leads to an accurate appraisal of probable Threat courses of action. The knowledge of how

units are arranged in echelon indicates (if the Threat assumes the offensive) which units are used in the initial attack and which units are employed in supporting and reserve roles. Tactical deployment with respect to terrain also is important. A study of disposition with an analysis of the terrain leads to conclusions concerning Threat capabilities, vulnerabilities, and probable courses of action. Accomplish this through the IPB process detailed in FM 34-130.

Movement of units is part of disposition. Movement is the physical relocation of a unit from one geographical point to another. Patrol activity may be an indication of planned movement but, in itself, is not movement. Movement is significant because it automatically changes the tactical deployment of the opposing forces. When a Threat unit has moved, is moving, or possibly will move in the future, it becomes capable of executing a number of actions which affect the conduct of the battle (or the current political situation). Such a unit moves into an attack position, moves to reinforce or to replace a unit, or performs other missions. In view of these possibilities, movement of a unit becomes important. The 06 analyst must continually monitor unit movements in order to provide correct and detailed data on Threat dispositions.

STRENGTH

Strength describes a unit in terms of personnel, weapons, and equipment. Information concerning strength provides the commander with an indication of enemy capabilities and helps determine the probable courses of action or options open to Threat commanders. A lack of strength or a preponderance of strength has the effect of lowering or raising the estimate of the capabilities of an opposing force. Likewise, a marked concentration or buildup of units in an area gives the commander certain indications of enemy objectives and probable courses of action. During peacetime, changes in the strength of potential Threat forces are important factors which may indicate changes in the enemy's intention. Appendix D describes enemy strength computations.

TACT I CS

Tactics in OB intelligence include tactical doctrine as well as tactics employed by specific units. Tactical doctrine refers to the Threat's accepted principles of organization and employment of forces for the conduct of operations. Tactics, on the other hand, describe the manner in which units conduct an operation. From a knowledge of tactical doctrine, the OB analyst knows how the Threat may employ forces under various conditions and in certain type situations or special operations. Units normally are expected to perform according to certain patterns within the framework of their tactical doctrine. Ail Armies establish basic principles and patterns for the employment of infantry, motorized rifle (MR), tank, and artillery units in the offense and defense. Of a more specific nature, special ized tactical doctrine a certain unit employs in given situations during combat or training activities is analyzed, because it indicates possible changes in Threat doctrine. Doctrinal templating, as detailed in FM 34-130, is one method of graphically portraying enemy tactics.

TRAINING

Individual and unit training contribute significantly to the combat effectiveness of any military organization. The thoroughness, degree, and quality of individual training which the recruit, specialist, noncommissioned officer (NCO) , and officer receive are major factors in determining the overall efficiency of an armed force. Unit training, normally conducted in seasonal cycles from small unit exercises to large-scale maneuvers, is an essential part of the training necessary for a unit to operate at its full potential. Each type or phase of training a unit accomplishes adds to its capabilities and effectiveness.

Specialized training that a unit receives may point to its ability to undertake certain missions beyond its normal doctrinal capabilities or responsibilities. Therefore, it is easier to appraise the combat effectiveness of a unit when the degree and quality of its training are known, as well as any specialized training it undertakes.

LOGISTICS

Logistics closely relates to combat effectiveness. The adoption of a course of action depends on the abil ity of the logistical system to support that action. With knowledge of the current capabilities of a unit's logistical support structure, make a more accurate evaluation of its capabilities, strengths, and combat effectiveness. Also, the locations of elements of a unit's logistical support structure indicate the disposition of maneuver formations and CS elements. Categories of logistical information include--

- All classes and types of supply.
- Supply lines of communication.
- Logistical requirements.
- Procurement methods.
- Distribution priorities and procedures.
- Transportation networks and modes.
- Installations and logistical control points.
- Terminals.
- Evacuation and salvage procedures.
- Maintenance.

COMBAT EFFECTIVENESS

Combat effectiveness describes the abilities and fighting quality of a unit. Numerous tangible and intangible factors affect it. Combat effectiveness affects the capabilities of a unit or army and is predicted by analyzing--

- Personnel strength.
- Amount and condition of weapons and equipment.
- Status of training.
- Efficiency of the officer and NCO corps.
- Quality of leadership.
- Length of time a unit has been committed in combat.
- Traditions and past performance.
- Personality traits of the unit commanders.
- Geographical area in which committed.
- Morale, esprit, health, discipline, and political reliability (or belief in the cause for which they fight).
- Status of technical and logistical support of the unit.
- Adequacy of military schooling at all levels.
- National characteristics of the people.

ELECTRONIC ORDER OF BATTLE

Electronic OB information is required to conduct EW. This data includes communications and noncommunications equipment parameters, such as emitter type and nomenclature (including encoding equipment), modulation, multiplex capability, pulse duration, pulse repetition frequency, bandwidth, associated weapons systems, and other technical characteristics of electronic emissions. They also include critical communications nodes such as CPS and logistical control points. They support Threat electronic order of battle (EOB) templating. With electronic technical data, a more accurate evaluation of the enemy's vulnerability to electronic countermeasures (ECM) and deception is made; signals intercept and direction finding (DF) for the production of SIGINT is made easier; and support is given to electronic counter-countermeasures (ECCM) by assessing the threat EW capabilities.

MISCELLANEOUS DATA

Miscellaneous data includes supporting information needed by an analyst to develop other OB elements. Miscellaneous data includes basic intelligence described as "know your enemy."

Personality files contain information on certain characteristics and attributes which describe individual members of a military force. A knowledge of personalities is important in identifying units and, in some cases, predicting the course of action the unit will take. Personality data, therefore, is valuable because the tactics and combat efficiency of particular units are often closely related to key individuals within its command structure.

Unit history includes information and intelligence on the elements of a specific unit; on present and past parent units; personalities who have commanded the unit; and other details like past performance and activities which describe, limit, or clarify the capabilities of the unit concerned. The development of unit history is important in determining the capabilities and limitations of a unit. Military or paramilitary units, like individuals, develop characteristics which distinguish them from other units. Just as they consider the various qualifications and traits of threat personalities, OB personnel also must consider a Threat unit as a personality in analyzing its capabilities and limitations. Information on uniforms and insignias is an important part of "'know your enemy" intelligence. This information assists in establishing unit identification and organization and in determining morale and esprit de corps.

Some foreign armies use systems of code numbers, names or false tactical markings to conceal true designations (or affiliations) of units, field post numbers (FPNs) (unit mailing address), and vehicle identification or side numbers. These systems, when properly analyzed, are valuable sources of information that are related to unit composition and disposition.

The OB analyst is able to recognize and appreciate the capabilities and limitations of foreign weapons and equipment. Although technical intelligence agencies are primarily concerned with the determination of weapons and equipment characteristics and capabilities, the analyst uses this intelligence to analyze the effects of these items on the organization, disposition, tactics, and combat effectiveness of the mil itary force.

ORDER OF BATTLE REFERENCES

THIS SECTION IMPLEMENTS STANAG 2077 1

Standard OB references are published by higher echelons during peacetime. They form the basis for lower echelon OB efforts.

ORDER OF BATTLE BOOK

An OB book is a summary of all basic intelligence concerning the composition, disposition, identification, subordination, and strength of a foreign nation's military forces. It includes all units from the various services that function in a ground or ground support role. It normally is published at EAC by the service departments and by the DIA. Allied nations, particularly the NATO nations, also publish OB books. The level or echelon of units shown depends on the level of command for the intended user. Generally, this is at least one echelon above and two echelons below that of the intended user. During peacetime, units which form only on mobilization are identified as such.

The OB book includes the following information for each unit:

- Identification, to include:
  - -- Numerical designator and type of unit.
  - -- Nationality (if more than one nation's forces are included in the OB).
- FPN.
- Subordination (parent unit) .
- Subordinate units.
- Location, to include:
  - -- Place name (and country if deployed abroad).
  - -- Installation number or name (if applicable).
  - -- Military geographic region (if applicable).
  - -- Universal transverse mercator (UTM) coordinates (supplement with geographic coordinates whenever possible).
- Category and effective strength.

The following data also is included:

- Code name or code number (enemy assigns official name or number).
- Nickname (unofficial popular name).
- Honors or honor titles.
- Unit insignia.
- Latitude and longitude of subject (in addition to UTM coordinates) .

- Commander's name, rank, initials and specialty, and those of other key personnel.

- Combat effectiveness (including any data on special ized training).

- Signature equipment.

- Turret numbers, vehicle registration numbers, or other tactica l identification signs.

- Any other data at the discretion of the originator for example, basic encyclopedia (BE) or target data inventory (TDI) numbers.

The structure of an OB book varies, However, it normally contains three sections:

Section 1. General

Section I contains the table of contents, explanatory notes and glossary of terms, acronyms, and abbreviations used in the document, summary list of major changes since the document was last issued, and sumrnary chart of current dispositions.

Section II. Detailed Order of Battle

Section II contains formations or un ts grouped according to their subordination and echelon. For example, military district, region, front level formations, and units follow immediately after the district, region, and front headquarters to which they are subordinate. While the same methodology is applied at all other levels of command within a district, region, or front formation, the inclusion of units subordinate to regiments is optional. Units of unknown subordination are included at the end of each district, region, or front and are identified clearly as such.

Section III. Sumneries or Supporting Documentation

Section III contains any additional summaries or supporting documentation, such as maps. The use of orientation maps of the nations dealt with in the OB book is an important visual aid, especially when the units being dealt with are superimposed. For a large country like the USSR, include an orientation map for each military district.

Annually issue or emend OB books. While the timing and degree of amendment are left to the discretion of the originators, an amendment normally is published when substantial changes to publ ished OB holdings are detected. The date of information (DOI) for the contents of the OB book is taken to be the information cut-off date. Any amendments to the OB book should indicate their own 001.

ORDER OF BATTLE HANDBOOK

The OB handbook, which is often referred to as a "handbook of military forces,"' is a summary of basic intelligence on a foreign nation's

political or governmental structure and military establishment, including its tactics and doctrine. It includes more technical data, such as the logistical system used and the characteristics of weapons and equipment. Like the OB book, higher US and allied commands publish the handbook.

The OB handbook normally deals with only one country. It deals with two or more countries in separate parts, especially when these countries are closely associated with each other by pact, geographically, or in some other way. As a minimum it contains--

- History, governmental, and political structure. A short history of the nation and a comprehensive description of its governmental and political structure.

- Armed forces organization. A description of the nation's military establishment (including paramilitary and an explanation of how C2 of the ground forces is affected).

- Ground forces organization. A complete explanation of the organization and composition of all the various types of ground force units and formations. The organization and composition of a nonground force unit also is included if that unit is likely to be placed under command or in support of the ground forces in time of war.

- Logistical support organization. An explanation of the logistical system the ground forces employs from ministerial level to the lowest echelon.

- Strategic and tactical doctrine. An explanation of the nation's strategic and tactical military doctrine, especially at combat levels of command.

- Reserve forces or mobilization. A description of reserve forces, the mobilization system and times required for mobilization.

In addition, the OB handbook includes--

- Military education and training. A description of the military education and training system and an explanation of the personnel recruitment and selection process.

- Uniforms and insignia. A full description of all armed forces uniforms, ranks, and insignia.

- Weapons and equipment. A listing and brief description including characteristics of the various types of weapons and equipment found in the ground forces. The list includes weapon and equipment's country of origin, availability of technical expertise, and likelihood of resupply of equipment and spares.

° Allies. A list of likely military and political allies, and type of support each may render.

The contents of the OB handbook are organized in the sequence shown above. When included, organizational and tabular data are presented as follows:

° Armed forces organization, governmental and political structure. Organizational charts are to support the narrative description of these subjects where possible. There is no format for such charts.

° Organizational structure. Depict organizational structure for each type of unit, Within NATO, the-symbols depicted in STANAG 2019 rapresent the various units, formations, or installations. Arrange the organizational diagrams in the following sequence: headquarters, combat units, CS units, service support units.

° Tables of personnel , weapons, and equipment. Produce the tables according to STANAG 2077. Figure 3-1 shows a sample equipment list.

Amend OB handbooks periodically. The timing and degree of amendment are left to the discretion of the originator. They should, however, initiate amendment action whenever you detect a substantial change to intelligence contained in the handbook or whenever you have a number of minor amendments.

INSTALLATION HANDBOOKS

Ideally, installation handbooks contain complete information concerning every military installation in every city in the county or Al. They are useful, particularly during peacetime, for establishing which forces are already in place. During wartime, the usefulness of installation handbooks decreases somewhat. However, they still indicate likely reserve mobilization and training centers. Two particularly useful handbooks are the Automated Installation Intelligence File (AlIF) and the Contingency Planning Facilities List (CPFL).

MISCELLANEOUS REFERENCES

Other publications and periodicals prepared at departmentl and area command levels are of value to the OB analyst. These references may deal specifically with 0B or with any or all phases of tactical, operational, and strategic intelligence. Specialized technical intelligence agencies provide detailed evaluations of equipment. The Soviet Battlefield Development Plan provides current and projected Soviet battlefield capabilities. The CIA produces studies on general mil itary capabilities, and economic factors which impact on military capabilities. Civilian organizations under contract to the Department of Defense (DOD) make special studies on various subjects concerning foreign and enemy military forces. These studies usually are detailed, technical in nature, and provide a wealth of special information not otherwise available.

NATO Serial No	Original or short NATO Title	Description	Remarks

Equipment lists are to conform to the format shown above. The sequence and numbering of equipment are to be established by Supreme Headquarters Allied Powers Europe (SHAPE) according to STANAG 2077.

Figure 3-1. Equipment list.

ORDER OF BATTLE RECORDS

The OB analyst uses various recording aids in organizing and cataloging OB information. The OB analyst creates OB records and files through a compilation of information available in the references discussed above. Subsequently, they are used continuously to produce current intelligence and to update other intelligence records, like the SITMAP and IPB products. OB files facilitate easy reference and comparison of OB information collected at various times from various sources. Each intelligence processing element decides which aids to maintain. The type used depends on the echelon of command and the local situation. Some common recording aids are:

- Unit workbook.
- OB workbook.
- OB SITMAP.
- OB card file.
- Personality file.
- Military installation file.
- Organizational worksheet.
- Strength worksheet.

Other file systems or forms are developed locally for special situations.

UNIT WORKBOOK

The format of the unit workbook depends upon the structure of the foreign army being monitored. Typically, it consists of a collection of OB cards supplemented by supporting documentation and is arranged by type of unit or in numerical sequence. Minimally this documentation includes organization and strength worksheets with the workbook being updated as new information is received. The enemy parent unit listed on the unit worksheet should agree with the analyst's level of command.

The analyst normally maintains records for enemy units one level above and two levels below the command's. In some special purpose units, three levels or more down are followed as well. Review information from units three levels down to develop identities on units two levels down. List personalities on the worksheet as a ready reference to the personalities of the enemy unit. Note and use unit, postal, and vehicle numbers on the worksheet to determine 0B changes or to confirm current data. Note details which may reveal any facet of the enemy unit's 0B or indicate the source of information in the remarks column. Enter reports of branch insignia, number and type of weapons, and statements of local residents in this column in abbreviated form. Include the data and the source of information for each entry. The installation column of the worksheet shows the numerical designation assigned to a particular enemy installation when plotted on a sketch, map sheet, or town plan attached to the workbook. For consistency and to facilitate exchange of information between headquarters, use installation numbers Previously assigned by theater or MACOM, Figure 3-2 shows a sample unit workbook. Figure 3-3 shows a sample page from the unit workbook.

ORDER OF BATTLE WORKBOOK

The OB workbook aids the analyst in sorting, evaluating, and interpreting information and in preparing intelligence reports.

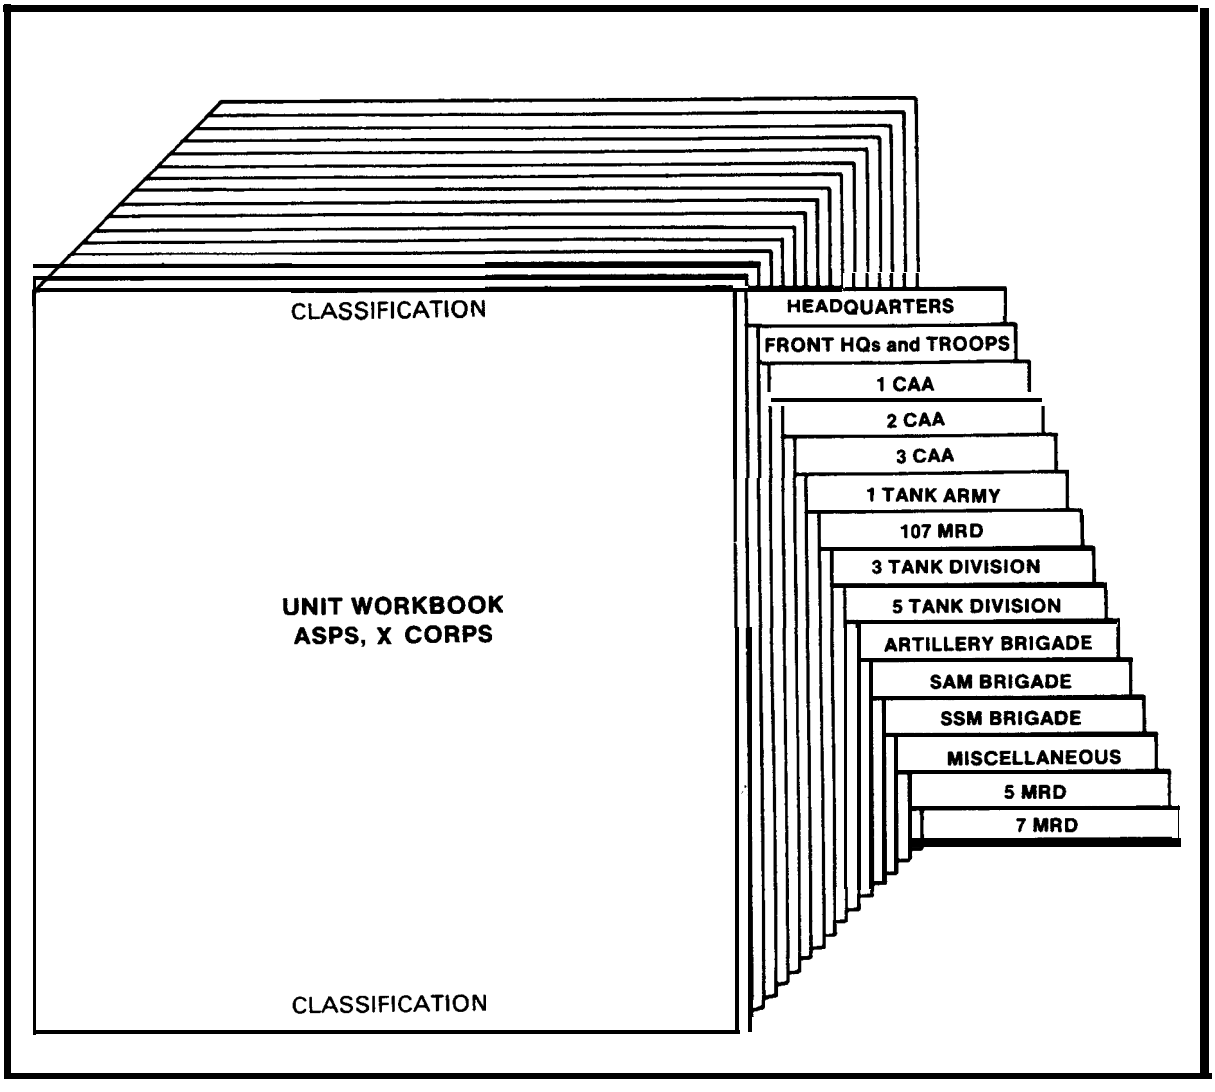

Figure 3-2. Sample unit workbook.

There is no prescribed format for the OB workbook. At corps level and higher, the OB workbook is tabbed to conform with paragraphs of the OB annex of the PERINTREP (see Appendix A). This makes it easier to extract needed information for the production of intelligence reports.

Information is entered under the appropriate haading or headings as either a complete report or a digest of the original report. All entries contain a journal date and number in addition to identification of the source. Comments added after each entry show the significance of tha report when compared with the overall tactical situation. Figure 3-4 showa how information is organized in an OB workbook.

ORDER OF BATTLE S I TUAT 10N MAP

The 06 SITMAP is a graphic portrayal of current threat OB, either confirmed or unconfirmed. It shows identification and disposition of the opposing units and any other information which will assist in developing the threat 06.

As a general rule, threat units one echelon above and two echelons below the analyst's own level of command are plotted by using the appropriate symbols in FM 101-5-1. For example, division plots maneuver regiments and battalions; corps plots maneuver divisions and regiments. Plot higher units to tha extent practicable. The foregoing information is only a guide. Analysts at theater level who are responsible for publication of OB books may plot separata battalions. Peculiarities of unit organization, the tactical situation, and time and personnel available within the analysis section determines more precisely what is plotted and what is omitted on OB maps. Enter the time and date of the information to the left of each symbol or plot. During counterinsurgency operations, however, it may be necessary to plot guerilla or insurgent units down to the squad level, since, depending on the situation and the

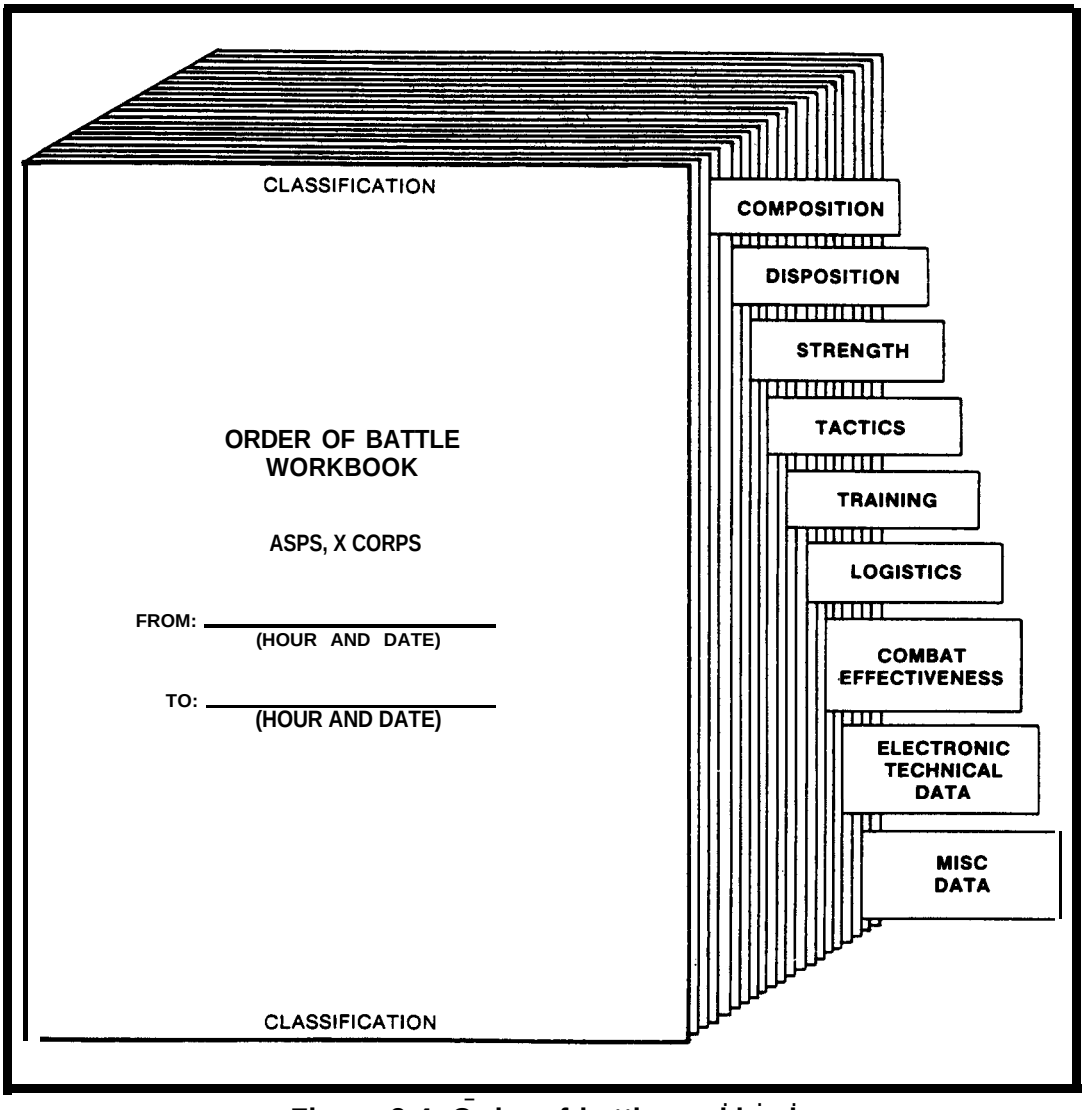

Figure 3-4. Order of battle workbook.

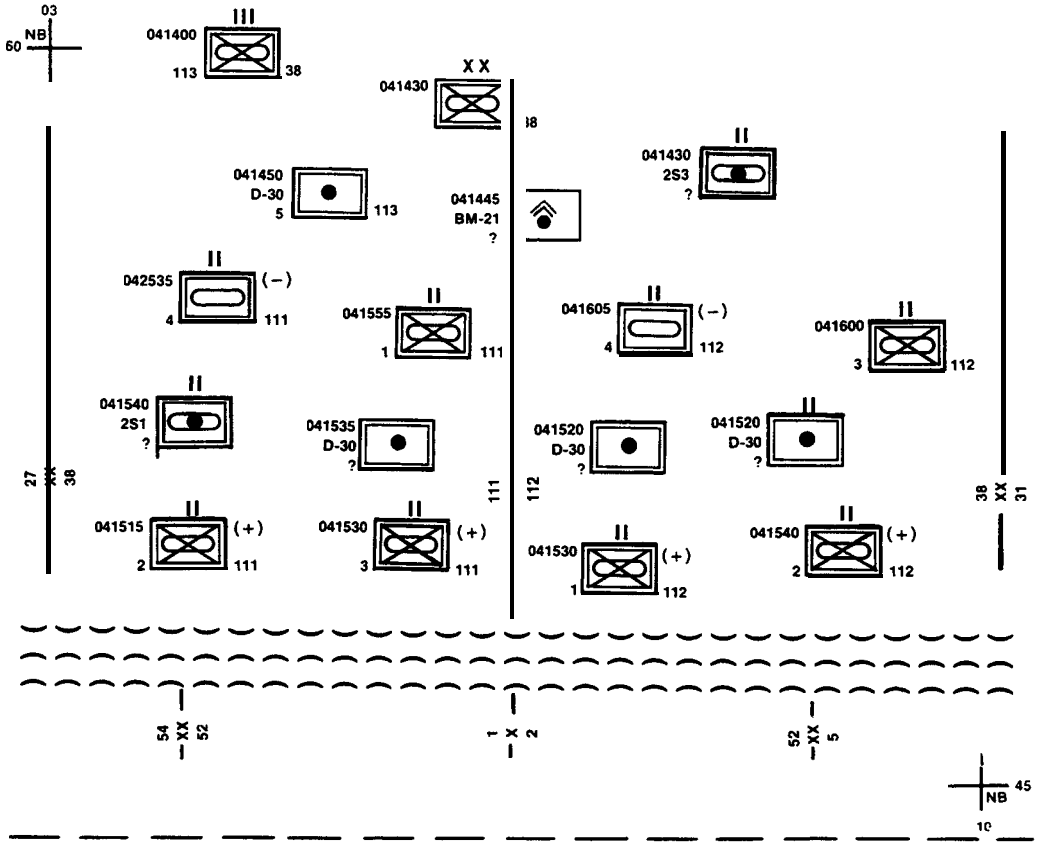
area, there may be no larger units operating against friendly forces. Figure 3-5 shows the OB SITMAP. The OB SITMAP contains the same types of information as the working SITMAP (described in Chapter 2), except it is kept in a less cluttered state so it is better integrated with G3 or S3 operational maps and for briefing purposes. At battalion and brigade levels, S2 and BICC officers often do not keep separate working and briefing OB SITMAPS.

Prepare the OB SITMAP as an overlay. Like other overlays, the OB SITMAP contains titling data. This data includes:

- Overlay title.



Located Units (by type)			Unlocated Units
Committed Forces			
Unit	**No.**	**Wpn**	Recon Bn, 38th GMRD 114th Tk Rqt, 38th GMRD UI Ind Tk Bn, 38th GMRD SSM Bn, 38th GMRD

Arty Bn	8	18xBM-21 MRL 18x152mm SP How 72x122mm How 36x122mm SP How	

Figure 3-5. Order of battle situation map with caption box.

- Map sheet name.
- Map sheet number.
- Map series.
- Map scale.
- Prepared by _____.

A caption box on the OB SITMAP is an annotation containing information which helps to identify and explain the OB situation graphics. Although any number of caption boxes are used, normally three types are necessary: strength, unlocated units, and legend.

The entries in the strength caption box usually consist of strength computations in numbers of personnel, types of units, and weapons and equipment categorized as committed forces, FS, and available reinforcements. Reconnaissance elements which are part of an opposing maneuver unit are considered as reinforcements, if uncommitted. Assumptions like these are made to portray probable enemy capabilities.

The OB analyst must be aware of what is not known about the enemy. The unlocated units caption box lists existing unlocated units. These units pose a threat to the accomplishment of the friendly mission, and maximum effort must be directed toward establishing the disposition of unlocated units in the AO.

When it becomes necessary to improvise symbols for enemy units, include a legend caption box on the OB SITMAP. Within this caption box, explain the exact meaning of each, improvised symbol.

ORDER OF BATTLE CARD

The analyst uses OB cards to maintain complete and accurate data on enemy units. The format of the card is standardized within NATO to facilitate the exchange of information and intelligence among allied forces. The standard recording system (whether manual or automated) is based on a card entitled "'Order of Battle Card."' Such cards are maintained in wartime, at all levels including division and lower when directed by higher headquarters or when desired. Normally, keep one card for each enemy regiment and independent battalion within a friendly unit's AI.

Information on the OB card includes--

- Identification (numerical designation, type of unit, and nationality).
- FPN.
- Subordination (parent unit).

- Subordinate formations or units.
- Location (place name and UTM coordinates).
- Table of major equipment (including war establishment and current effective strength).
- Combat effectiveness and category (where applicable).

The OB card contains the following optional information:

- Code name (offical name assigned by the enemy for convenience or as a cover) .
- Honorific title.
- Nickname (unofficial popular name).
- Insignia.
- Commander.
- Unit history.
- Signature equipment (including significant quantities).
- Turret numbers, vehicle registration numbers or other tactical identification signs.
- Miscellaneous.

Record validity dates and source references on the back of the card. Also record information subject to frequent changes on the back of the card. This includes--

- Unit locations.
- Strength.
- Combat effectiveness.

Figure 3-6 shows the front and back sides of the 08 card.

PERSONALITY FILE

A personality file records personality data on designated categories of individuals. The development of the personality file is probably one of the most difficult analytic functions, particularly for the personnel in Threat units at division level and below.' However, much information is available through open-source I iterature and intelligence information reports (IIRs). This file provides reference material used in the development of other OB intelligence. Information on key military figures

History:

Miscellaneous:

Figure 3-6. Order of battle cards.

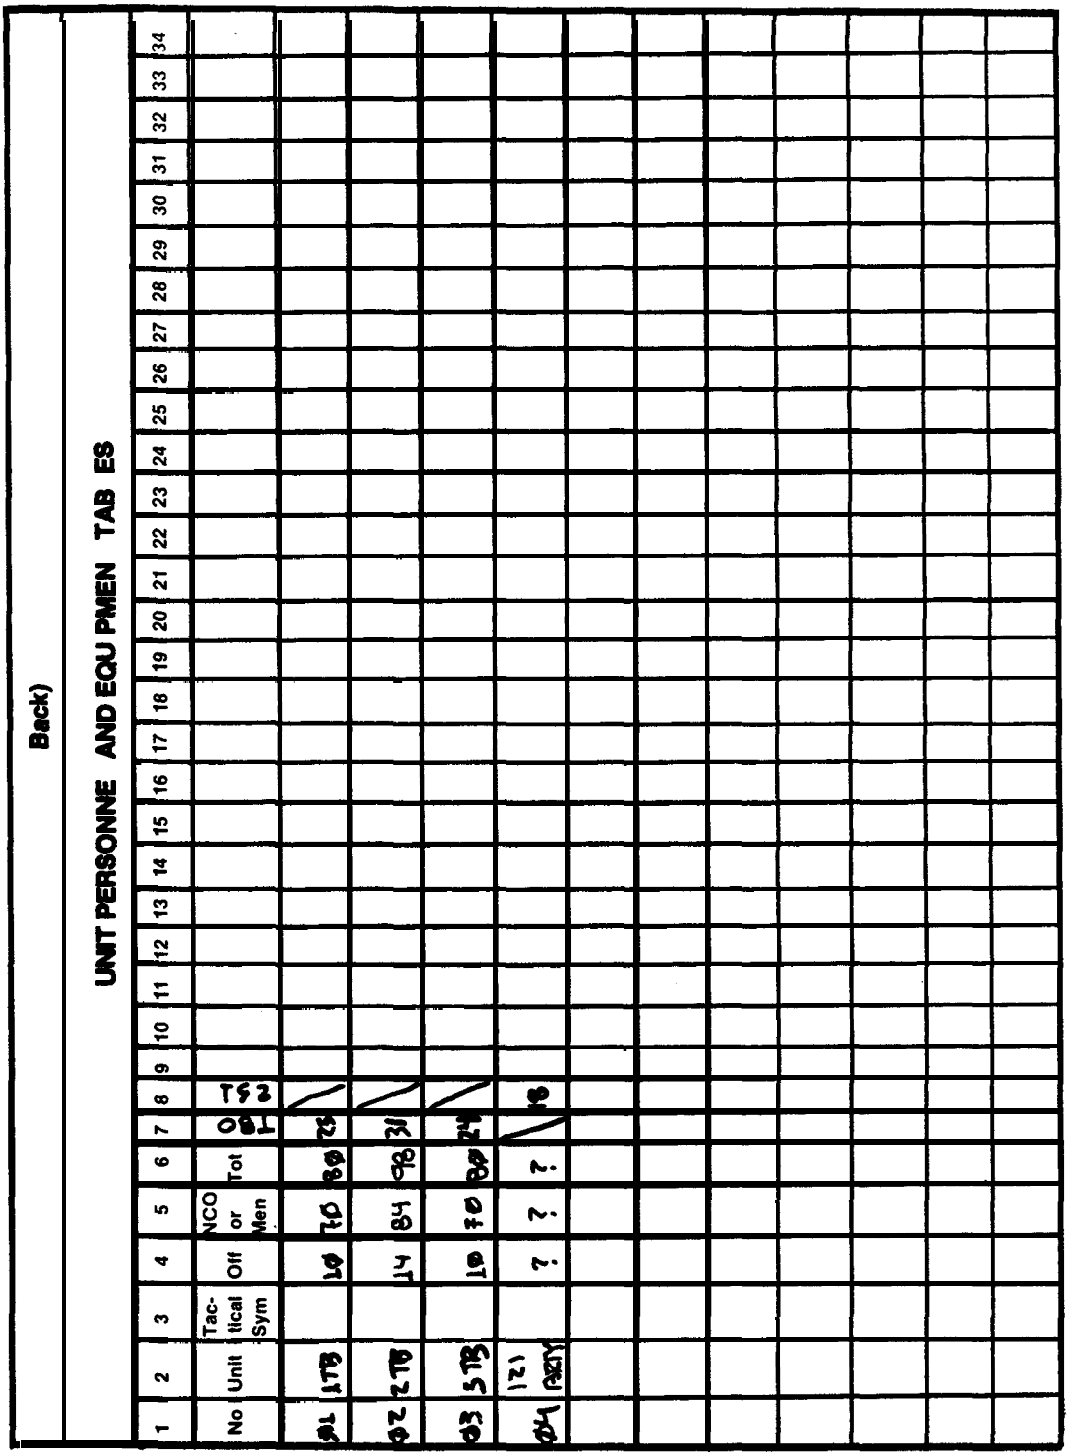

Figure 3-6. Order of baffle cards (continued).

is of significant value in the establishment of unit identification, tactics, and combat effectiveness. Keep the file in alphabetical order.

The card (or sheet) contains information concerning the individual's name, rank, current assignment, date and place of birth, civilian education, political affiliation, nicknames, and physical peculiarities. The file also contains the individual's schools, qualifications, awards, decorations, chronology of assignments, campaigns, engagements, demonstrated performance in leadership assignments, and important activities participated in, as well as character traits I ike morals, reputation, appearance, and mannerisms, published articles (which may identify areas of concentration and expertise), and cliques with which the individual is associated (may indicate influences and upward mobility prospects). Each entry records the source and date of the information.

The personality file also includes information which aids the friendly commander, G2, and G3 in deception planning and operations. This includes habits that make the opposing comrnander and staff vulnerable to deception, the most likely deception targets, the degree of freedom the cormmander allows subordinates, how the commander reacts to new situations, and how the fear of the unknown influences the commander's actions. Figure 3-7 shows a suggested format for biographies used in personality files required by STANAG 2077. Similar files may be maintained for key staff officers and other categories of key personnel.

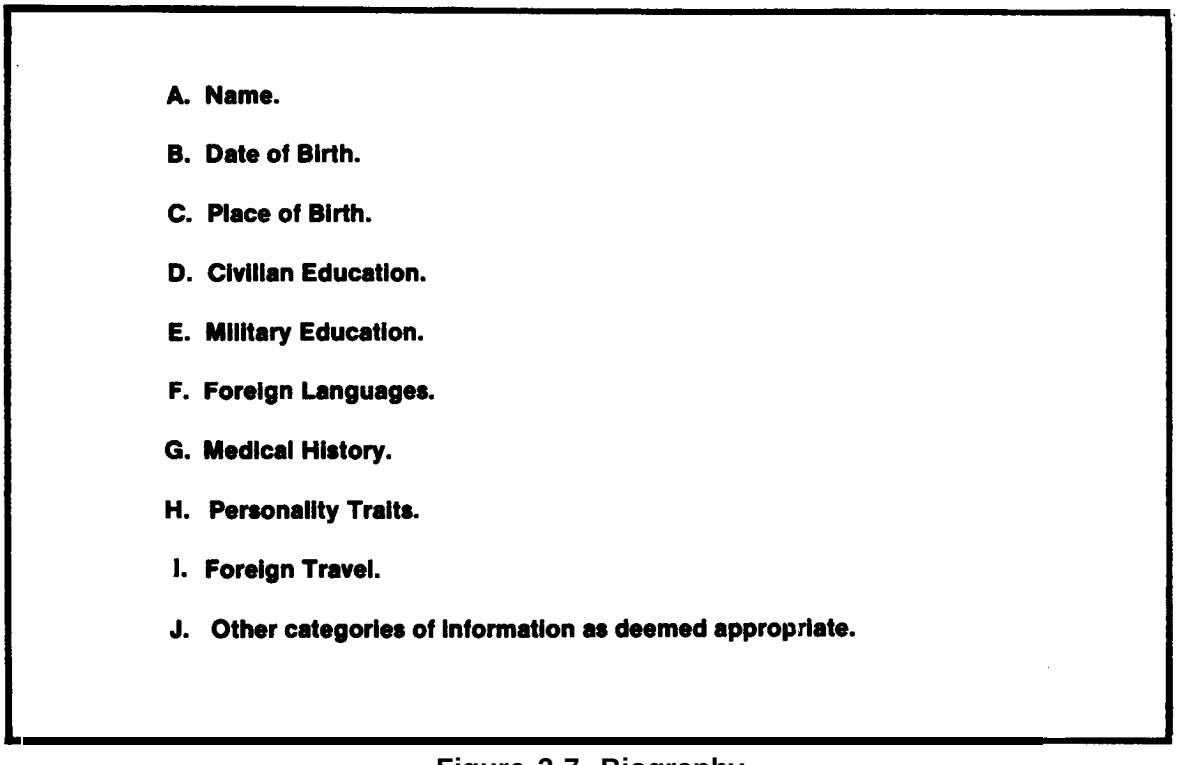

Figure 3-7. Biography.

MILITARY INSTALLATION FILE

During peace time, higher echelons maintain military installation files normally to facilitate publication of installation handbooks. A collation or explanatory sheet contains all information that has bean collected on each installation to include the number and types of buildings and their capacities, personnel uniforms and insignia, and major items of unit equipment. Maps, town plans, or sketches showing the location of each installation within the city supplement this file. Figure 3-8 shows a sample military installation file.

ORGANIZATIONAL WORKSHEET

The organizational worksheet provides a convenient method of showing types of units within an armed force. Organizational worksheets depict the complete breakdown of all units from the highest type headquarters to the lowest unit, including personnel and major wsapon strengths. Since this is rarely possible on a single sheet of paper, prepare a chart showing the general organization of the major unit and individual charts for each of its subordinate units. Prepare principal weapons and equipment charts to supplement organizational charts. Figure 3-9 shows a sample MRR organizational worksheet.

STRENGTH WORKSHEET

Use the strength worksheet to maintain a running numerical tabulation of the enemy's personnel and equipmant strengths. This information is recorded on committed units, FS units, and reinforcements. Figure 3-10 shows a sample strength worksheet.

COORDINATE REGISTER

When personnel and time are available, the brigade and battalion BICCs maintain a coordinate register. The coordinate register provides the lower echelon intelligence officer with a workable counterpart to the extensive intelligence files and workbooks that are maintained at higher echelons. It graphically illustrates the situation over a small geographical area. It is compact enough to be carried with ease for ready access.

The register is usually a looseleaf notebook. Each page represents a single grid square on the operational map which covers the geographical AO and AI. This geographical area should include the enemy area, friendly area, and areas of concern on both flanks.

The coordinate register contains two types of pages. One type is for written entries which describe enemy activities, locations, weapons, and similar items. The DTG and map coordinates precede these entries. The S2 adds personal comments or notations to any entry. Figure 3-11 shows a coordinate register page with written entries.

Figure 3-11. Coordinate register with written entries.

The second type schematically represents a single grid square. Entries are plotted on the square in the same manner used to plot the enemy S I TMAP. This page shows graphically any data applicable to a single grid square. Figure 3-12 shows how an enlarged grid square is drawn and entries are made.

The coordinate register is used to--

- Determine enemy dispositions and routes of movement.
- Predict enemy intentions and main effort.
- Plan reconnaissance and surveillance (R&S) operations.
- Brief and debrief patrols.

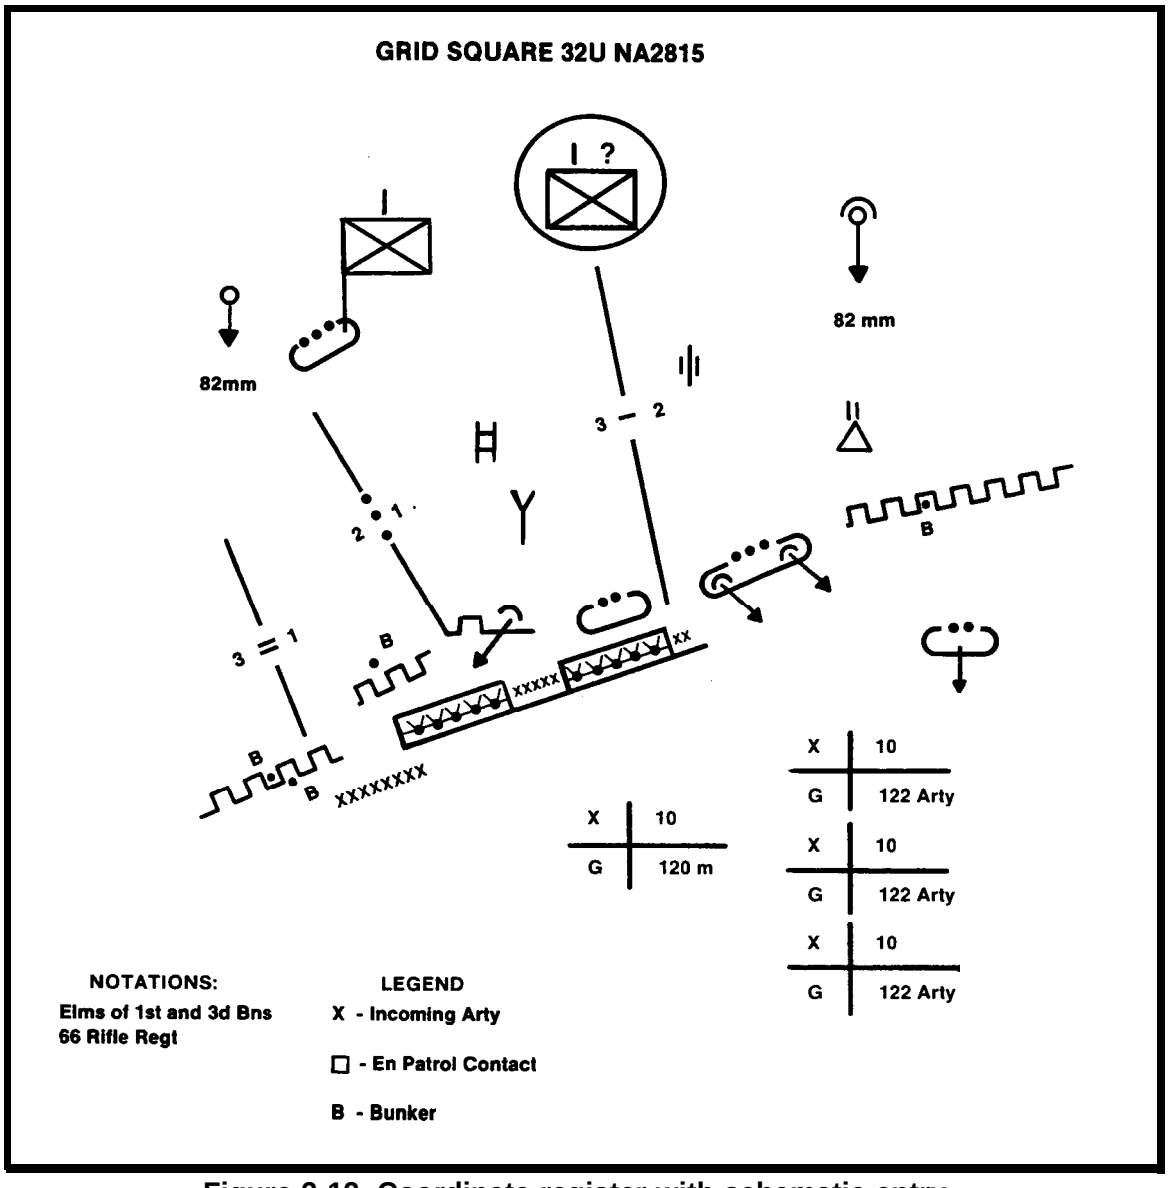

Figure 3-12. Coordinate register with schematic entry.

- Plans FS.
- Brief the commander and staff.
- Assist in IPB.
- Reveal enemy perceptions of how the terrain will support maneuver against them.

Data from the coordinate register is plotted on a vertical aerial photograph that has been annotated with grid lines. A scale of 1:25,000

or larger is desirable. By plotting selected OB information on the photo, an analysis of the terrain is conducted simultaneously with a correlation of information on the enemy. The photo provides an excellent means of briefing commanders down to platoon level on the AO and the enemy situation. Targeting is accomplished in a more precise manner by using a photo instead of the traditional 1:50,000 map. While not common in mid- to high-intentsity conflict these photos are especially useful in LIC.

The coordinate register is reviewed when the unit moves to a new area, when new data is added, and when obsolete data is deleted. Timely maintenance of the coordinate register is not practical in fast-moving high-intensity situations like pursuit, delay, and exploitation. The coordinate register would, however, be very valuable in a relatively static situation or in a low-intensity conflict (LIC).

Whenever possible, maintain the register on strong semitransparent bond paper. The transparency of bond paper is sufficient to allow the use of a grid scale underneath the schematic page. This allows a more accurate and rapid plotting of, or reference to, the entries.

The scale of the schematic page normally is a matter of SOP. Such standardization assists in dissemination of intelligence data from higher to lower echelons. For security reasons, the friendly situation normally is not plotted in the coordinate register.

ENEMY COMBAT EFFECTIVENESS

A number of factors, some tangible, others not, determines the combat effectiveness of enemy units. Of these factors, only the personnel and equipment strength lend themselves to factual analysis, and only major items of equipment, like tanks, armored personnel carriers (APCs), and artillery weapons lend themselves to detailed quantifiable analysis. This is because personnel strength fluctuations are extremely difficult to assess accurately. Appendix D describes procedures for computing personnel and equipment strength. The following states the combat effectiveness of a unit:

> "The 133 MRR is estimated to be at 80 percent effective strength. Evidence of low morale suggests that the unit is less combat effective than the estimated effective strength may indicate."

ARBITRARY UNIT DESIGNATORS

The identification, by title, of a particular unit or formation on the battlefield is difficult during war. Although it is argued that such precise identification is not important and that one enemy division is as much of a threat as another, this ignores the problems of collation, dangers of double counting, and confusion. To deal with this problem, NATO and national formations apply a unique arbitrary unit designator (AUD) to unidentified enemy formations.

There are two types of unidentified enemy formations:

- Formations which are well known except for their actual title.

- Formations seen on the battlefield whose history, background, and title are unknown.

SHAPE allocates the AUDs. They appear in NATO and national OB summaries in peacetime in the columns normally filled by unit title. Use these AUDs in war also.

The AUDS consist of a prefix, a number, and a suffix.

The prefix consists of a three-digit alphanumeric distinguishing code that indicates the number and nationality of the corps that originates the AUD. The following are examples:

- The 1st British Corps uses lUK.

- The 2d German Corps uses 2GE.

- The 7th US Corps uses 7US.

A two-letter distinguishing code indicating the NATO formation and allocating the AUD is an optional method of establishing prefixes. Figure 3-13 shows these AUD prefixes.

Each national corps allocates blocks of numbers between 000 and 999 to their own headquarters and subordinate formations. Similarly, divisions may, if they wish, suballocate numbers to their subordinate formations. All formations of a corps and corps headquarters, however, use the same prefix.

After the prefix and number is a suffix indicating--

- The nationality of the enemy formation.

- The type of formation.

Do not change the actual numbers allocated by a particular national or NATO formation normally unless an unidentified enemy is recognized separately by two formations, each of which allocates its own AUD. Under such circumstances, the relevant superior headquarters, having agreed that an unidentified enemy formation is present, will either--

- Accept one of the already allotted AUDs, but replace the prefix with its own.

- Allocate a new AUD.

In either case, inform both of the originating formations.

As an example of an unidentified enemy with two allotted AUDs, a division of the 2d German Corps and a division of the 1st British Corps separately detect the presence of an unidentified Soviet MRD in the area

SHAPE	SH
AFNORTH	AN
COMNON	NN
COMSONOR	SN
COMBALTAP	BA
COMLANDJUT	JA
COMZEALAND	ZE
AFCENT	AC
NORTHAG	NG

AMF(L)	AM

Figure 3-13. Arbitrary unit designator.

of the intercorps boundary and each gives it an AUD using the block of numbers al located to them by their own corps (2GE369 UR MRD and 1UK473 UR MRD, respectively). Each corps adopts the AUD allocated by its division.

The corps HQ knows from which division the AUD originated by the number appl ied. HQ NORTHAG agrees that an UI UR MRD is present and decides to retain the German (GE) number but allocates it a NORTHAG prefix. From then on, until positively identified or changed by Allied Forces, Central Europe (AFCENT), or SHAPE, the unidentified formation is known as NG369 UR MRD. If for some reason it is changed by AFCENT or SHAPE, apply an AFCENT or SHAPE prefix.

CHAPTER 4

INTELLIGENCE PREPARATION OF THE BATTLEFIELD

IPB is a tool to aid the commander and staff in determining where and when to use limited resources to achieve decisive results. IPB applies to all phases of the AirLand Battlefield; close-in, deep, and rear operations synchronization are all supported by the IPB process.

For planning the close-in phase of the operations, IPB provides a guide for the initial allocation and employment of combat power. Through event templating, it is possible to identify where the enemy probably will thrust if attacking, or where the enemy will concentrate forces if defending. Through terrain and weather analysis and templating techniques, it is possible to determine where friendly forces can best move, shoot , and communicate, and where to place friendly strength against enemy weakness. During tactical operations, IPB supports the use of fire and maneuver to achieve a tactical advantage. Event templating facilitates following enemy forces and determining their probable course of action. Decision support templates (DSTs) enable the commander to apply combat power in a timely manner.

IPB is especially useful as a tool for planning and fighting the deep operations. Through threat evaluation, enemy critical nodes and HVTS are identified readily. Event templating determines the optimum time and place to interdict the enemy to achieve maximum delay, disruption, destruction, and when and where to achieve decisive exploitation of identified weakness. it facilitates the identification and location of deep targets in time to strike them at the optimum time and place in a manner which constrains and causes the collapse of close-in enemy actions. AirLand Battle concepts were introduced in Chapter 1 of this manual, and an application of IPB and collection in deep operations and maneuver plans is further explained in FM 34-130.

When planning rear operations, IPB allows the commander to efficiently focus friendly efforts. Capacity and trafficability of supply routes are identified. Avenues for the commitment of reserves become apparent, as do the choke points which the enemy will attempt to target. The analyst studies drop zones (DZs) and landing zones (LZs) and the air approaches to them, and provides the commander information about the rear area threat. The most advantageous locations for support areas can also be found. All of this permits the commander to use friendly forces in the most economical method possible, which frees assets for the close-in and deep operations.

IPB is an essential part of staff planning. Initially, the G2 uses it to develop intelligence about the enemy, weather, and terrain that the commander and staff need to complete their planning. The analysis of the AO and the intelligence estimate primarily embody this intelligence. While IPB does not replace these documents totally, use it as an aid to their development. It aleo converts much of the written material into

graphics which are understood easily, analyzed, and appl ied to the planning process.

The intelligence estimate is a key to the decisionmaking process. Through IPB, the estimate is presented in a graphic format. This enables the commander and staff to see, rather than visualize mentally, where both friendly and enemy forces can move, shoot, and communicate. It provides a graphic data base for comparing friendly and enemy courses of action. Weather and terrain overlays tell us not only where the enemy moves, shoots , and communicates but where friendly units accomplish these functions as well. Just as the G2 uses templating to determine enemy courses of action, the G3 uses templating techniques to compare friendly courses of action.

IPB helps the G2 determine--

- Where to look.
- When to look.
- What to look for.
- What to look with.
- What to expect to see.

IPB helps the G3 determine--

- Where to maneuver, shoot, jam, and communicate.
- When to maneuver, shoot, jam, and communicate.
- What friendly resources to maneuver, shoot, jam, and Communicate with.
- What enemy assets to maneuver, shoot, and jam.
- What results to expect.

IPB is vital to the commander's estimate and tactical decisions regarding the concept of the operation because it produces an accurate comparison of friendly and enemy capabilities and courses of action. It enables the commander to see friendly and enemy vulnerabilities and opportunities and to determine where, when, and how to support forces to ensure success.

Successful preparation and application of IPB products depend on the intelligence analyst's ability. The intel l igence analyst must know both enemy and friendly maneuver doctrine; must understand what a mission statement involves; and must focus efforts to support the mission. To provide the commander with the intelligence required to make a high quality decision, the analyst must also coordinate extensively with other staff sections. These include the G3 or S3, the FSE, AD, engineers,

battlefield deception elements, and USAF weather teams. Other sections, such as the G5 and G4 or S4 become involved in rear area IPB. Each of these sections and others have data which are vital to IPB. Each of these sections also has requirements which are filled by IPB. Use of this manual and FM 34-130 helps the analyst succeed in supporting the commander effectively.

IPB influences every stage of an operation and is continuous. It begins with a staff estimate process, which involves interaction from all the staff sections.. Because battlefield conditions and tactical situations change, IPB must be dynamic. The products which result from IPB are often perishable, and must be updated to remain val id. Figure 4-1 shows how the staff sections interact during the IPB process. Chapter 4 of FM 101-5 describes in detail why IPB is conducted prior to an operation.

Conducting IPB and knowing how to apply its products, are two different processes. This chapter explains how the intelligence analyst utilizes IPB to assist the commander and staff in the successful planning and execution of AirLand Battle. A more detailed description of the IPB process is available in FM 34-130.

PURPOSE OF INTELLIGENCE PREPARATION OF THE BATTLEFIELD

The key to effective IPB application centers around the G2 or S2 staff understanding what can be accomplished with it. Much time and effort is expended without purpose if IPB is conducted in a vacuum.

The analyst's objective when applying the IPB process is to reduce battlefield uncertainties as they relate to terrain, weather, and enemy. During the IPB process, the graphics produced aid the commander and staff in planning and synchronizing more effective operations. IPB focuses the S2's intell igence collection effort where it is most effective. IPB also assists the commander in the decision-making process. For a detailed description of how IPB assists in decision making read Chapter 4, FM 101-5. IPB helps the commander control the battle by describing what the enemy's most likely course of action is, including when and where it will occur and how the enemy's follow-on forces affect the battle.

In situation and target development, the IPB product shows the commander when to most effectively attack enemy forces by fire and maneuver and when to seize the initiative. Using the IPB graphics, the intell igence analyst can identify and prepare the attack of HPTs as they move onto the battlefield. This reduces the effectiveness of the enemy's forces, causing them to be disrupted and delayed, and presenting further targets for maneuver or FS missions. In threat integration of IPB, the analyst uses analysis models to forecast events on the battlefield.

The IPB process, if applied properly and with purpose, contributes immeasurably to mission accomplishment. However, as with any predictive instrument, IPB will never achieve 100 percent accuracy.

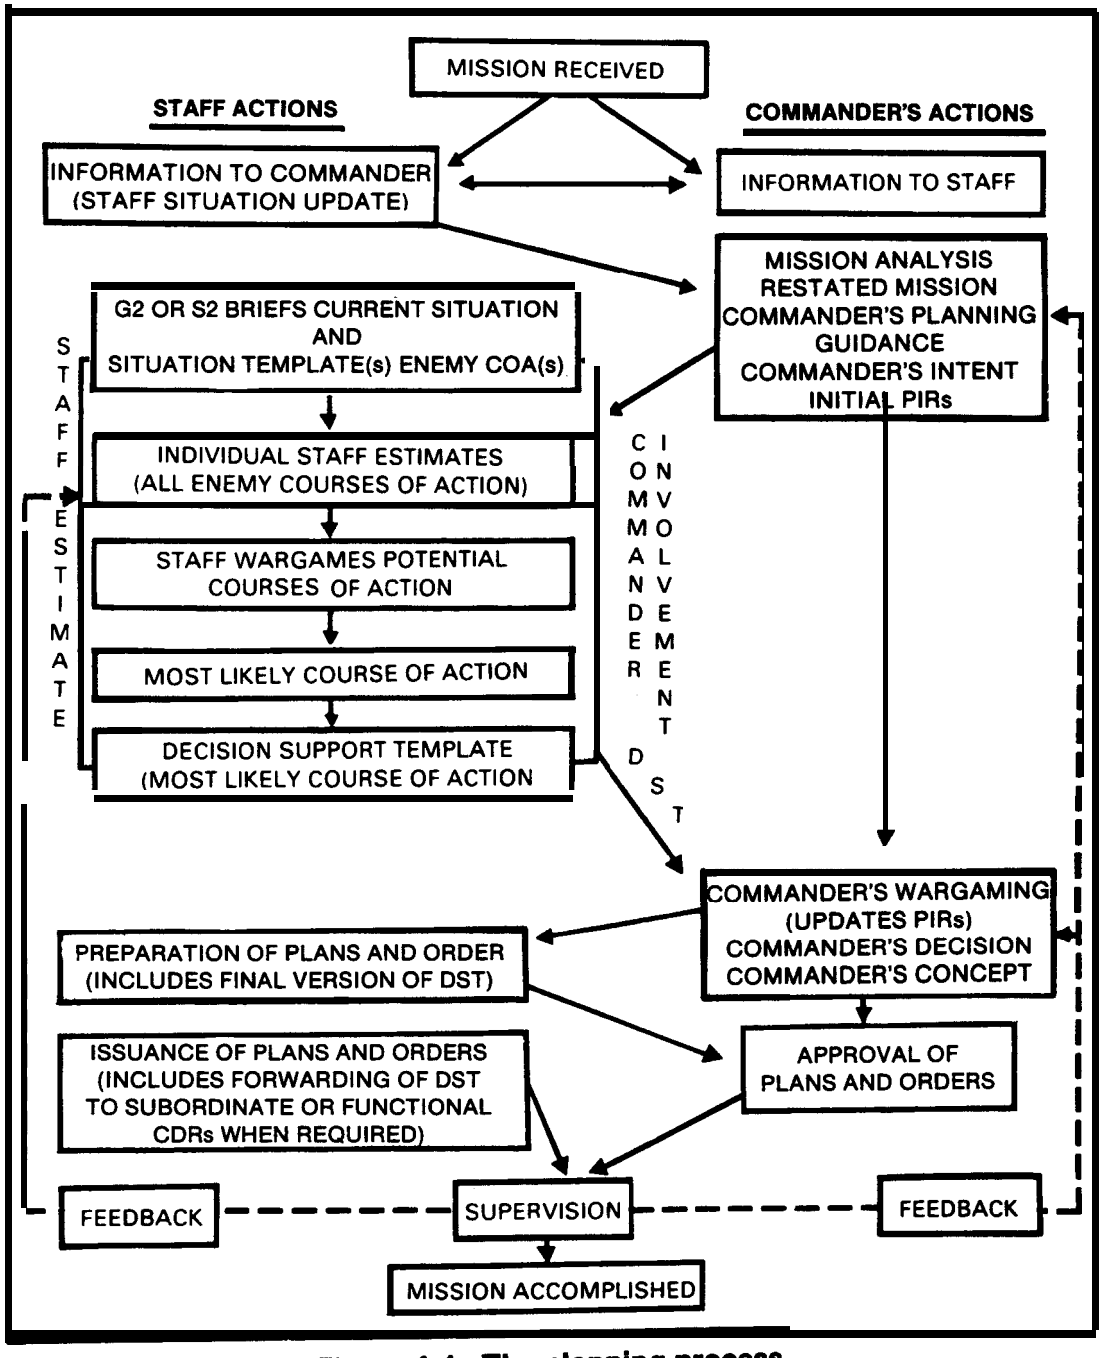

Figure 4-1. The planning process.

DEVELOPMENT AND USE OF INTELLIGENCE PREPARATION OF THE BATTLEFIELD PRODUCTS

Graphics are basic to IPB analysis. Often intelligence is communicated best with pictures. The analysis of the battlefield and the intelligence estimate are not replaced, but merely assisted by graphics. These graphics become the basis for intelligence and operational planning. Currency is maintained through graphic renewal or update. Right now most aspects of IPB analysis are prepared manually. Preparing graphics by hand is slow and time-consuming. Properly prepared, graphics are relatively simple and inexpensive to maintain. The benefits of graphic analysis and display of intelligence are worth the initial investment of time and resources. It is therefore incumbent upon the G2 or S2 to make maximum use of available time and personnel to produce those graphics which are most beneficial to the commander. Particularly at brigade and battalion level, all personnel must be capable of conducting the IPB process. Additionally G2s or S2s at each echelon should provide subordinate unit S2s as many IPB products as possible. This saves time and permits the subordinate level S2 to expand on higher level IPB products or produce others unique to the unit mission.

The graphics produced during the IPB process have numerous purposes and functions. A good analyst knows what to accomplish from each. Terrain and weather factor overlays, for example, help depict the effects of terrain and weather on potential friendly and enemy courses of action.

Further on in the IPB process, analysts produce four templates--doctrinal, situation, event. and decision support. Figure 4-2 gives the description and purpose of each template. These templates help the analyst to deduce and analyze enemy capabilities, predict their most likely courses of action, identify information gaps, and determine TAIs. In other words, the graphics produced during the IPB process help in conducting analysis.

APPLICATION OF INTELLIGENCE PREPARATION OF THE BATTLEFIELD

The IPB process begins with the mission. Upon receipt of a mission, the commander analyzes the situation and has the staff present a situation update. From this initial information, the commander conducts mission analysis and restates the mission. The commander then sets the staff planning process in motion by providing planning guidance and intent. The commander also determines initial PIRs.

Using the commander's guidance, the staff begins to prepare their estimates. The IPB process primarily takes place during the estimate process.

The intelligence analyst considers the amount of available time and the number of soldiers on staff who can conduct IPB. Giving due consideration to resources, the analyst initiates the IPB process with the intent to produce sufficient graphic products to assist the commander and staff in their planning.

As a minimum, the analyst prepares a modified combined obstacle overlay (MCOO), a situation template depicting how the enemy looks at the most critical moment on the battlefield, an event template from which to develop the R&S plan, and a DST.

The G2 or S2 applies IPB to assist the analytical process and accomplish as much of the process as possible to support the commander in what little time is available. Time is the analyst's greatest enemy as there is never enough of it. If there is time for only one situation template, the analyst prepares the one most critical to the commander's mission. This is why it is so important for the G2 or S2 staff to understand the commander's intent. Time spent initially providing guidance and establishing specific tasks for each member of the G2 or S2 staff who conducts IPB, goes a long way towards a more complete IPB product which contributes to the commander's successful mission accomplishment.

TEMPLATE	DESCRIPTION	PURPOSE	WHEN PREPARED
Doctrinal	Enemy doctrinal deployment for various types of operations without constraints imposed by the weather and terrain. Composition, formations, frontages, depths, equipment numbers and ratios, and HVTs are types of information displayed.	Provides the basis for integrating enemy doctrine with terrain and weather data.	Threat Evaluation
Situation	Depicts how the enemy might deploy and operate within the constraints imposed by the weather and terrain.	Used to identify critical enemy activities and locations. Provides a basis for situation and target development and HVT analysis.	Threat Integration
Event	Depicts locations where critical events and activities are expected to occur and where critical targets will appear.	Used to predict time-related events within critical areas. Provides a basis for collection operations, predicting enemy intentions, and locating and tracking HVT.	Threat Integration
Decision Support	Depicts decision points and target areas of interest keyed to significant events and activities. The intelligence estimate in graphic form.	Used to provide a guide as to when tactical decisions are required relative to battlefield event.	Threat Integration

Figure 4-2. Intelligence preparation of the battlefield templates.

BATTLEFIELD AREA EVALUATION

Battlefield area evaluation (BAE) as the first step in the IPB process sets the stage for the rest of the process.

During the conduct of BAE, the intelligence analyst studies the battlefield area to focus the IPB effort. The analyst studies the battlefield to obtain a general feel for how terrain and weather affect operations. The AO has been provided.

Delineation of the AI is done to direct a portion of the collection effort (with support from higher headquarters) against enemy forces which can directly influence the unit's mission. The G2 and G3 or S2 and S3 determine the AI based on how much time the commander needs to react to a threat. For example, if the enemy has the potential to enter the battalion AO via one of the flanks, and the battalion reserve needs two hours to move to most areas on the flanks, then based on an enemy doctrinal advance rate of 6 kilometers per hour (kph), the analyst would probably extend the AI on the flanks to at least 12 kilometers (kms). The analyst must understand the mission, the commander's intent, and both friendly and enemy capabilities.

METT-T and the commander's concept of the operation determine the AI. Once the AI is established, the analyst informs higher command of the area it covers so they can assist in collection.

During the BAE phase the analyst studies the battlefield to determine significant areas and considerations to be studied in more depth during the remaining IPB phases.

Terrain Analysis

The intelligence analyst has one primary objective when conducting terrain analysis -- to reduce the commander's battlefield uncertainties as they relate to terrain. Terrain analysis emphasizes the use of graphics to portray the effects of terrain on operations.

The G2 or S2 depicts via graphic products--

- Terrain which impedes or hinders maneuver and mobility.
- Terrain which does not restrict maneuver and mobility.
- Avenues of approach (AAs) and mobility corridors (MCs).

The lower the level at which the analyst works, the less time the analyst may have to prepare terrain factor overlays. The analyst must prepare those overlays which support the commander's mission and intent. This requires the G2 or S2 to prioritize and set time lines as to what the analyst should accomplish.

Modified Combined Obstacle Overlays

The intelligence analyst prepares a MCOO. This overlay is a combination of various overlays or if done as one overlay, then simply is a graphic representation of what should be highlighted about the terrain. It is based on OCOKA (observation and fields of fire (FofF), concealment and cover, obstacles, key terrain, and AA and MCs).

Terrain analysis at division level and higher benefits from engineer terrain teams or detachments attached to G2 staffs assisting in terrain analysis. Time constraints may not permit receipt of engineer terrain products by brigade and battalion S2s. The intelligence staff must train in the conduct of terrain analysis to be capable of producing their own terrain graphics. Appendix E of this manual, Terrain Analysis in IPB, provides the analyst basic guidelines for conducting terrain analysis. For a detailed description of how to conduct terrain analysis refer to FM 34-130.

Terrain analysis focuses on the military aspects of terrain known as OCOKA. Chapter 4 of FM 34-130 provides a detailed description of OCOKA.

The following guidelines are important to the analyst when applying OCOKA.

Observation and Fields of Fire. Observation involves the type of units (both friendly and enemy) which are on the ground. The analyst asks questions such as:

- To what degree does vegetation or relief obscure tha observation of friendly or enemy units?

- How will the ground unit be observed from the air?

The analyst focuses on the time of attack or expected tima of enemy penetration into the main battle area (MBA). Also the analyst considers what night observation devices both forces possess. These factors impact on the conduct of the battle.

Another important factor is how the friendly force looks from the enemy's perspective. This principal applies to all other OCOKA factors as well. The distinction is made clear to the commander by providing details versus generalities.

Observation also influences the capability for R&S and TA. In the IPB context, this refers to optical and electronic line of sight (LOS). Many battlefield systems require LOS to function effectively. These include radios, radar, intercept and direction finders, jammers, direct fire weapons, human vision, and binoculars.

Air defense (AD) TA and weapons require LOS from their positions to air targets. The analyst considers the anticipated flight altitude relative to the elevation of adjacent terrain.

The effects of terrain and weather on these systems influence the commander's view of the battlefield. What is important for the analyst to consider when studying the terrain is to study it based on the battlefield systems available to the commander and the threat. Again, because time is limited, the analyst prioritizes those battlefield systems most critical to the mission.

LOS overlays graphically illustrate the effects of terrain on friendly and enemy observation and FofF. The horizontal visibility or FofF overlay combines the LOS effects of vegetation and elevation features. The relative capabilities of direct fire weapons, communications, and collection and TA systems become apparent. This overlay assists in identifying key terrain with greater precision. Figure 4-3 shows horizontal LOS FofFs. This is the type of overlay that the engineer terrain team prepares at division or higher. If assigned to brigade or battalion level, the analyst requests this overlay for the AI.

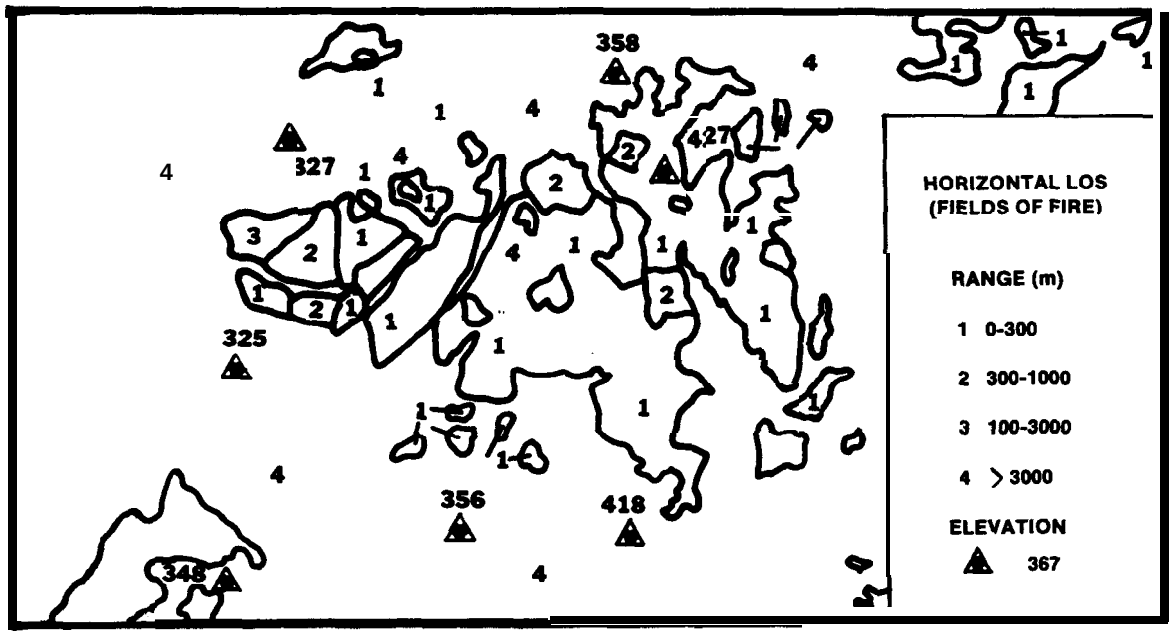

Figure 4-3. Horizontal LOS fields of fire.

Concealment and Cover. Concealment is protection from observation or surveillance. Cover is shelter or protection from fire either natural or artificial. The analyst discerns the difference between concealment and cover . The two are not combined when examining the terrain for their effects. The analyst examines concealment to distinguish it from ground and aerial observation.

The analyst decides the type forces which concealment may or may not impact; for example, concealment may be good for soldiers on foot, yet poor if riding in tracked vehicles.

The analyst addresses cover from direct and indirect fires. The analyst identifies (particularly important at battalion level) points within the AO where concealment and cover are critical to successful mission accomplishment.

Obstacles. Obstacles, whether artificial or natural, are very important considerations in the conduct of terrain analysis. Obstacles significantly impact on a force's ability to maneuver or move rapidly through an area. The analyst should not assume that an obstacle for friendly force units is an obstacle for threat units also. The wise analyst examines obstacles separately from the point of view of both enemy and friendly force units and acknowledges that obstacles are different and impact differently depending on the type of battlefield operating system that is used.

Key Terrain. Key terrain is any point or area on the ground whose control or seizure provides an important tactical advantage. Any terrain which increases a unit's abil ity to apply combat power or decreases the opponent's abil ity to apply theirs is considered key terrain.

Decisive terrain is that terrain which, if not controlled or if controlled by the opponent, significantly degrades the commander's ability to successfully accomplish the mission. For example: The Fulda River in West Germany, and in particular the crossing sites on it, is considered decisive terrain for US forces defending against Threat forces approaching from the east. On the other hand, the Harm River, 6 km east of the Fulda River, while it is considered key terrain for a unit in the defense, probably is not considered decisive terrain because--

- The Harm River hinders enemy movement across it (particularly if covered by fire); but it does not prevent movement because it is narrower and easier to cross than the Fulda.

- It is not an obstacle to movement because it is narrower and much easier to cross.

Avenues of Approach and Mobility Corridors. AAs are routes by which a force reaches key terrain or an objective. AAs are evaluated in the following terms:

- Maneuver support potential .

- Access to key terrain and adjacent AAs.

- Degree of canalization.

- Concealment and cover.

- Observation and FofF.

- Obstacles.

MCS are subsets of AAs. MCS are areas within the AA which permit movement and maneuver. They permit friendly and enemy forces to advance or withdraw in doctrinal configuration, and to capital ize on the principles of mass, momentum, shock, and speed.

The intelligence officer or analyst should not get caught up on whether a piece of terrain is an MC. It is important that the analyst identify, based on knowledge of friendly and enemy assets, routes which either force will most likely use. Later in IPB, the analyst focuses collection resources on them.

When determining AAs and MCs, the analyst uses the one-up, two-down rule. The analyst determines AAs for enemy forces one echelon above and MCS for forces two echelons below the level of command conducting the analysis.

In determining AAs and MCS, the analyst keeps in mind the type force for which they are developed, the unit mission, and the potential enemy force mission. If an air threat exists the analyst develops air AAs. If time is short, the analyst seeks assistance from higher commands. The analyst may even involve the unit air defense artillery (ADA) officer.

The analyst carries the AA through the enemy's immediate and subsequent objectives. When on the offense, the analyst identifies potential enemy counterattack AAs and if possible AAs within the AO for friendly force units. The analyst also identifies MCS for friendly units. In determining friendly AAs and MCS the one-down, two-down rule applies; that is, the analyst identifies potential AAs for subordinate elements one echelon below the command conducting the analysis and MCS for subordinate elements two levels below. The battalion S2, for example, identifies company size AAs and platoon size MCS.

TERRAIN DATA BASE DEVELOPMENT

The analyst compares terrain product requirements with the terrain data base to identify gaps. In addition to standard topographic maps covering the AI, the following sources are helpful:

- Current intelligence estimate and analysis of the AO from higher headquarters.
- Special terrain studies and products prepared by US or host-country agencies, special maps, charts, and geodetic studies.
- Current photography.
- Actual terrain reconnaissance.

TERRAIN FACTOR MATRIX DEVELOPMENT

The terrain factor matrix provides a guide for terrain analysis. The matrix develops from an analysis process whereby terrain factors are

identified and correlated with specific types of combat operations and battlefield functions. The terrain factor matrix assists the intelligence analyst in identifying the types of terrain products needed. Figure 4-4 shows the terrain factor matrix.

COMBINED OBSTACLE OVERLAY DEVELOPMENT

When the terrain factor overlays are stacked and registered, the uncolored portion represents areas in which a force moves unimpeded. Also highlighted are areas which facilitate a maneuver element's ability to shoot and communicate. The overlays show significant terrain features that are further developed in the analysis process. Through graphic terrain factor analysis, the terrain team and the S2 section focus on terrain areas that are significant for further analysis.

	FACTORS

EW Sites	X	X	X	X	X	X	X	

Figure 4-4. Terrain factor matrix.

The combined obstacle overlay incorporates all pertinent terrain factors which assist the analyst in identifying mobility areas and deducing trafficability rates for AA analysis.

Figure 4-5 is an example of a combined obstacle overlay. The overlay is particularly important because it integrates al 1 obstacles into one graphic display. This greatly simplifies further analysis of AAs and MCS. Crosshatching indicates the obstacles and the blank areas indicate freedom of movement.

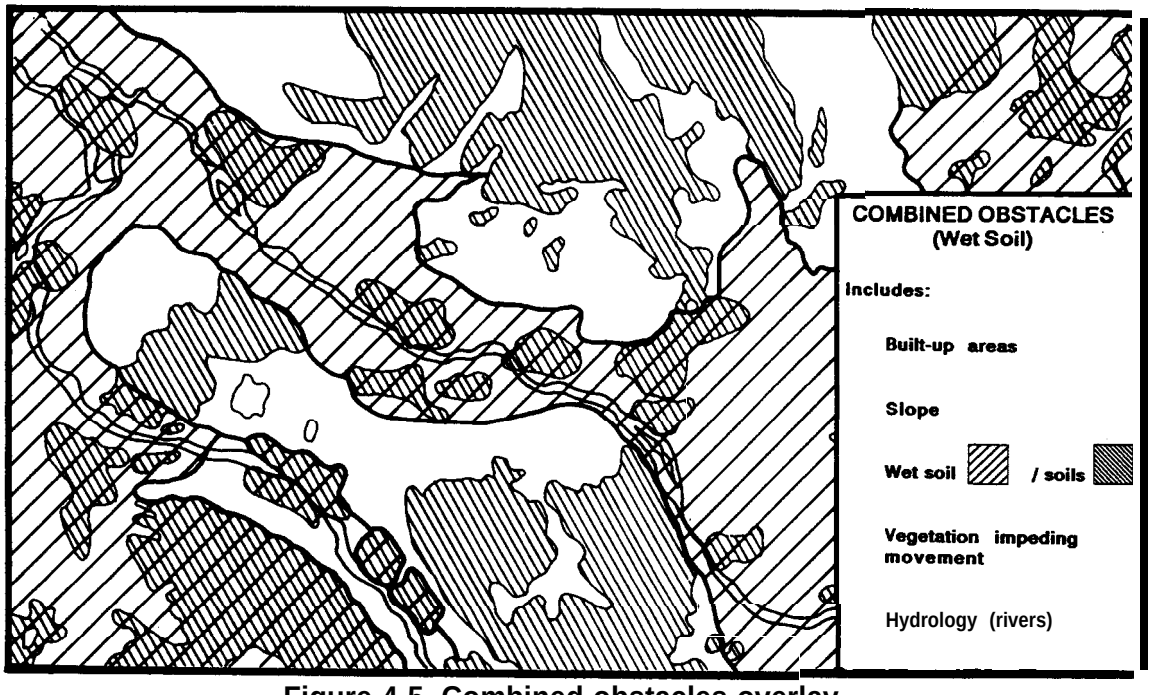

Figure 4-5. Combined obstacles overlay.

The effects of weather on mobility should not be ignored Through the cooperative efforts of terrain and weather teams, weather eff ects are integrated with the terrain analysis. As a result, the comb ned obstacles overlay reflects average weather-induced terrain conditions. Excessive precipitation affects soil density, slope, river stage, and visibility.

Cloud cover (CC) prolongs the drying period. Normal SLOW-GO traffic conditions may convert to NO-GO conditions which impact on both friendly and enemy force movements. The intelligence analyst prepares combined obstacles overlays that reflect at least normal weather effects on mobility. Based on a review of historic weather patterns, the analyst associates specific weather factors with specific time periods.

Figures 4-6 through 4-8 show--

° Obstacles with dry soil.

- Obstacles created by wet soil.
- Combined obstacles w ith wet soil.

The combined obstacles overlay provides a basis for identifying AAs and MCs. Having determined where the enemy cannot move without difficulty, the analyst focuses attention on those areas where the opposing force can move. Figure 4-9 shows normal requirements for identifying AAs and MCS.

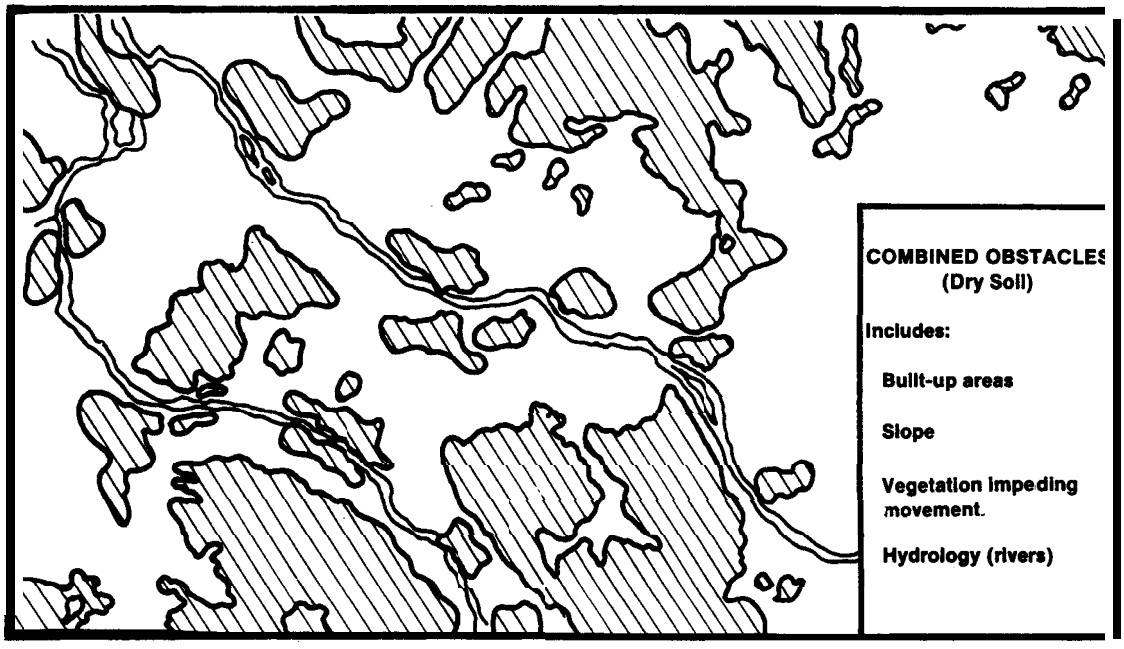

Figure 4-6. Obstacles with dry soil.

The combined obstacles overlay usually reveals one or more MC. Since regiments normally advance along separate MCS, each division AA should contain regimental MCS. The start point of an attack begins at enemy assembly areas and terminates at their objective.

A convenient technique for identifying AAs is to place a doctrinal template over a potential AA and visualize the enemy force moving through. Ask: Is there sufficient maneuver space? How does the enemy look while approaching critical points on the battlefield, such as the FEBA? How does the enemy look when considering attrition? An enemy force fighting through a covering force takes losses. To the attrition add the fact that the enemy has a narrower front when attempting a breakthrough. The analyst uses this information to depict a more realistic AA. When briefing on the AAs, the S2 or analyst must "talk" the commander through a visualization of the enemy force fighting along the AA. Figure 4-10 shows what the commander needs to see.

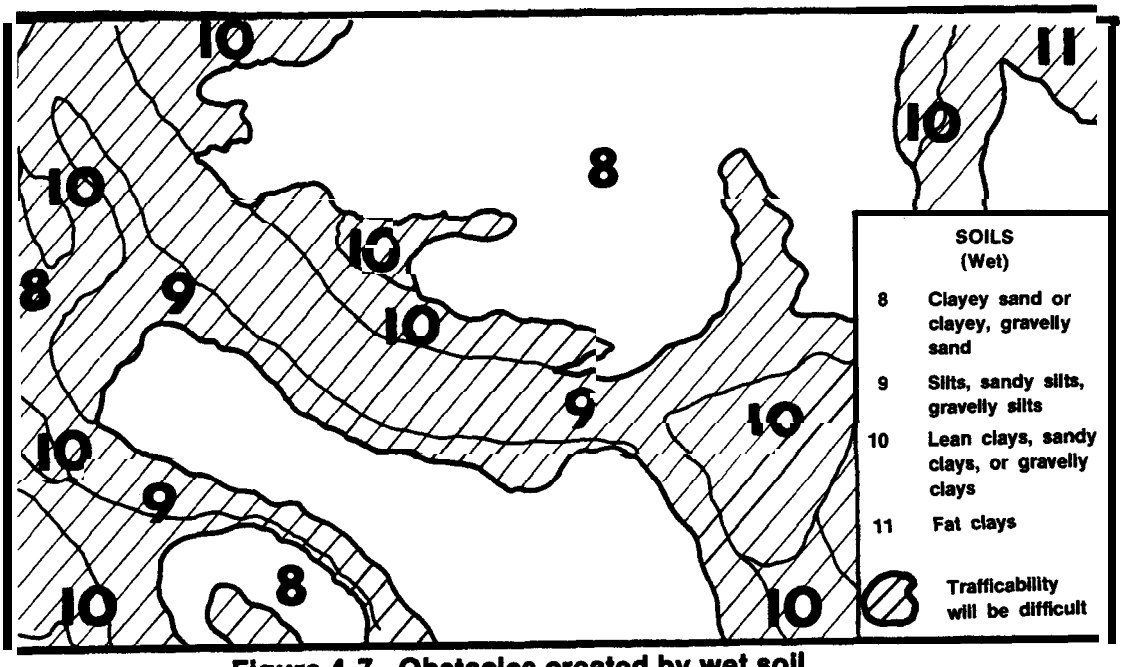

Figure 4-7. Obstacles created by wet soil.

The analyst moves the template along the avenue from projected enemy assembly areas to the objective. An AA is never completely free of obstacles. but it provides for relatively free movament. Obstacles generally parallel the direction of movement.

The analyst selects alternative AAs. If they partially overlap, the analyst should not be concerned. The most direct route to the objective normally is a viable option.

LINE OF SIGHT ANALYSIS

In terrain and weather analysis, the terrain team determines LOS for weapons, communications, TA, intelligence collection, and R&S systems. Direct fire weapon systems like the antitank guided missile (ATGM), the self-propel led antiaircraft gun, and the tank need good FofF to successfully engage the enemy forces at maximum range. FM radio communications, forward observers, TA and surveillance radar systems, and SIGINT need optical or electronic LOS to the target. Terrain and weather factor overlays assist in analyzing LOS limitations. LOS analysis helps determine where ground forces can best shoot and communicate and the most likely low altitude air approaches into the AO. In LOS analysis, the analyst considers the following factors:

- Terrain elevation.

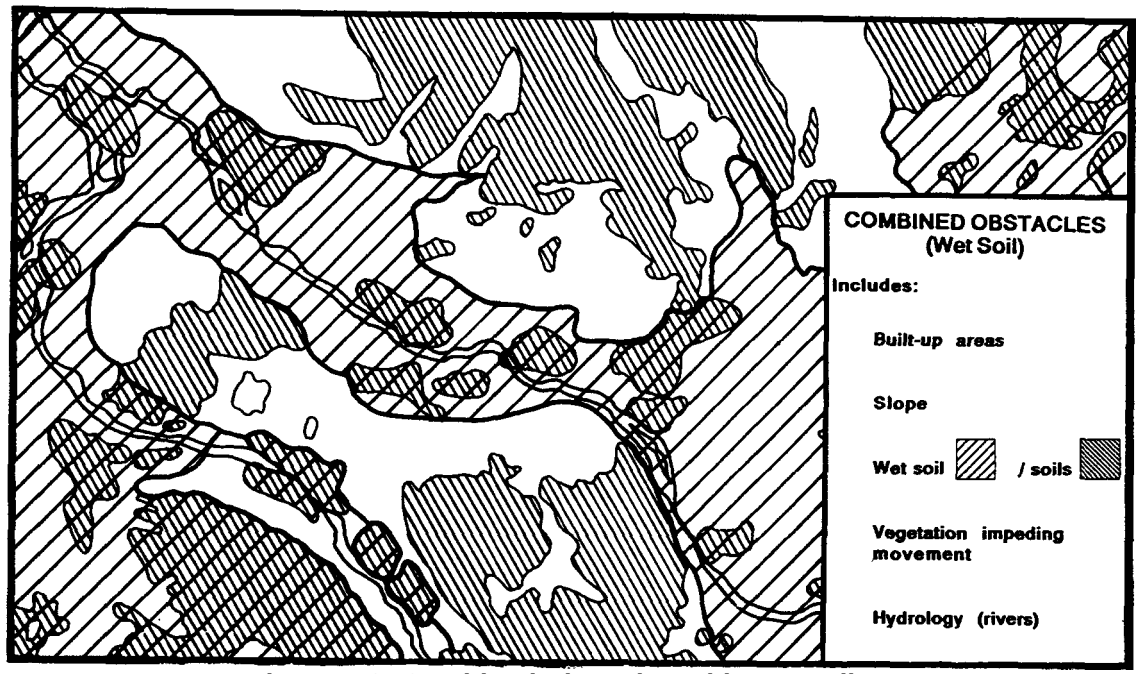

Figure 4-8. Combined obstacles with wet soil.

IF YOU ARE AT	AVENUES OF APPROACH	MOBILITY CORRIDORS
DIVISION	RECEIVE ARMY AA FROM PARENT CORPS DEVELOP DIV AA FOR SUBORDINATE BDE	RECEIVE REGT MC FROM PARENT CORPS DEVELOP BN MC FOR SUBORDINATE BDE
BRIGADE	RECEIVE DIV AA FROM PARENT DIV DEVELOP REGT AA FOR SUBORDINATE BNS	RECEIVE BN MC FROM DIV DEVELOP CO MC FOR SUBORDINATE BN
BATTALION	RECEIVE REGT AA FROM PARENT BDE	RECEIVE CO MC FROM BDE DEVELOP PLT MC

Figure 4-9. Avenues of approach and mobility corridors matrix.

- Tree and vegetation height above elevation.
- Height of built-up areas.
- Density of ground vegetation at full growth.
- Terrain factors, such as defiles, which are not apparent because of contour spacing.

- Effects of weather, such as fog or precipitation that obscure observation.

The effects of seasonal changes on LOS should be readily apparent. Winter vegetation compared to summer full growth alters LOS significantly. The limitations of the standard military map is overcome through imagery analysis (1A) and ground reconnaissance. Imagery analysts and terrain specialists are trained in LOS analysis.

Direct fire weapons systems require horizontal or ground LOS. As a rule, 4,000 meters (m) is considered the maximum range for unaided direct fire weapons. Horizontal LOS overlays also depict friendly LOS.

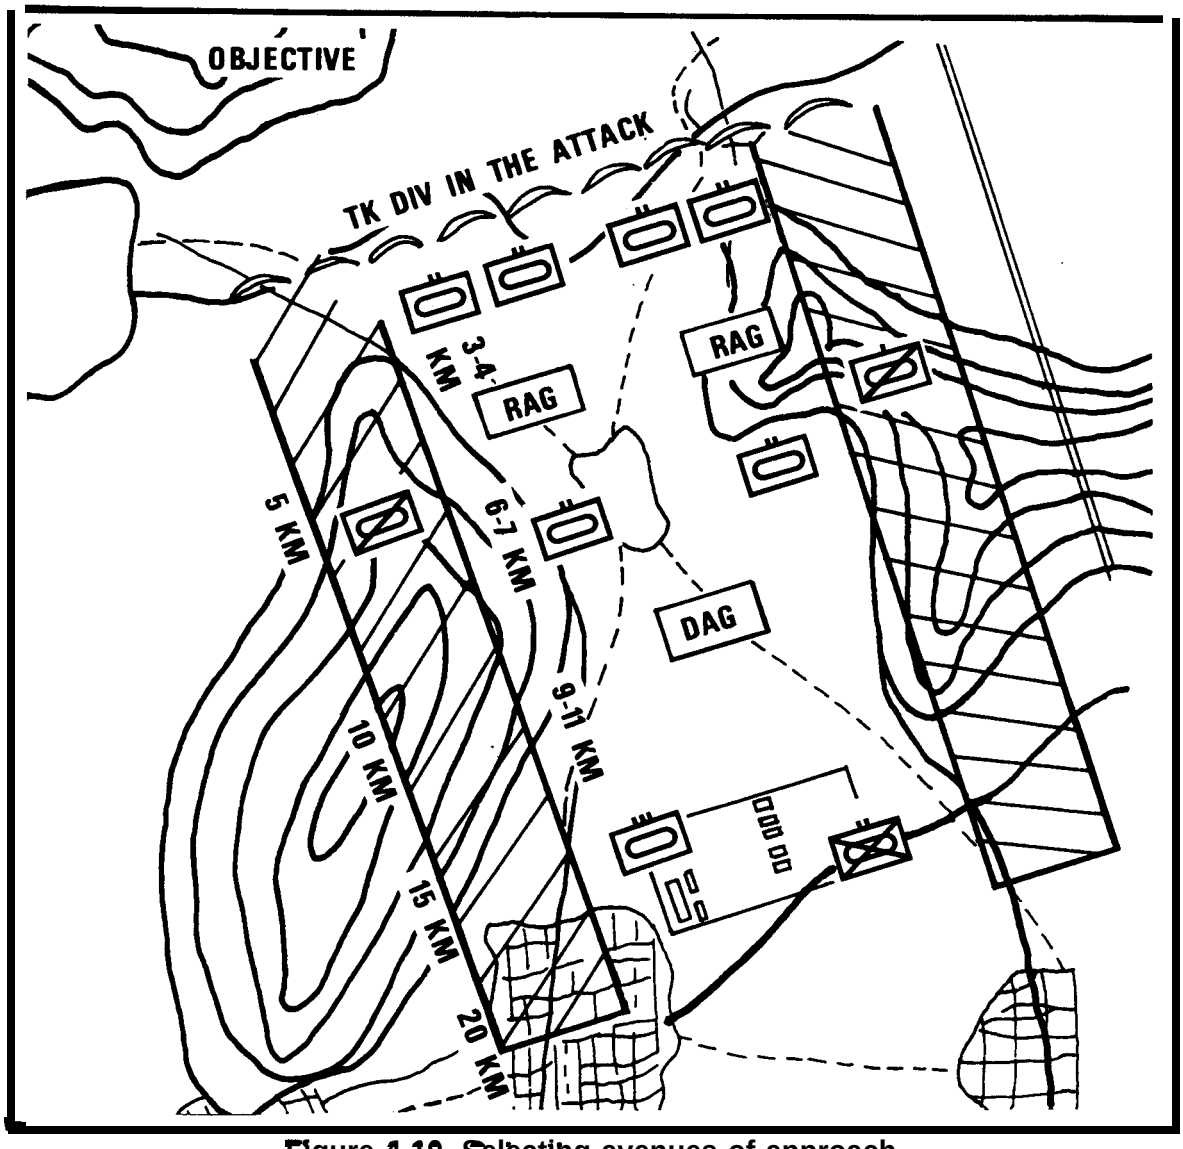

Figure 4-10. Selecting avenues of approach.

Figure 4-11 is a horizontal LOS overlay depicting FofF. Areas of maximum LOS are color-coded to aid analysis. Other range parameters are colored for easy identification. Heavily forested areas would not necessarily obscure LOS. Depending on the density of vegetation, LOS might penetrate 100 m or might penetrate 100 m or more of the forest. The height of ground vegetation and the seasonal density (taller than 1 m) might degrade LOS. This illustrates why an analyst must know the terrain of each battlefield system that is being analyzed.

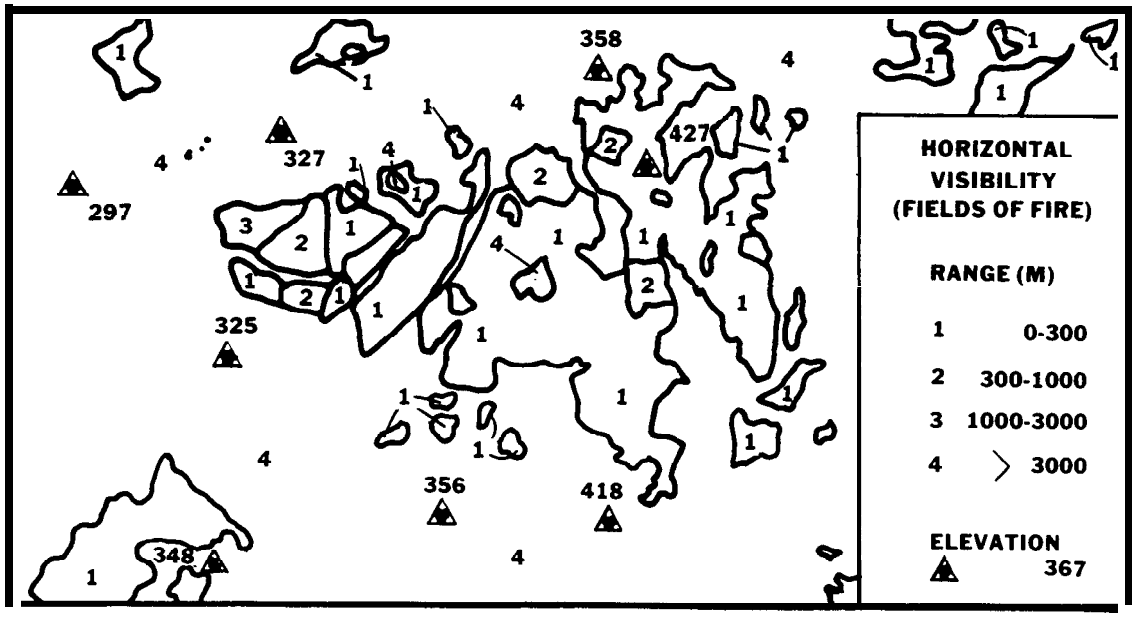

Figure 4-11. Horizontal visibility (fields of fire).

While ground-based systems need horizontal LOS, airborne systems use oblique or vertical LOS. An attack helicopter armed with machine guns and rockets rel ies on LOS from the aircraft to the target. Standoff weapon systems that pop up from behind masking terrain require accurate LOS and positioning data. Airborne R&S systems, such as the side-looking airborne radar (SLAR), have similar needs for LOS data. Analysis of vertical and oblique LOS from an enemy AD and target perspective helps identify the best air avenues of approach (AAAs) into enemy airspace.

Determining how terrain and weather conditions along each AA affects radio and other means of field communications is probably the area least considered by most analysts because of their general lack of knowledge of communications systems. The corps or division signal officer assists in determining the advantages and limitations of each AA to enemy communications systems. The SIGINT analyst also assists in this effort.

Most AAs do not offer unlimited options for the employment of communications and noncommunications systems. The intelligence analyst prepares a communication-noncommunication overlay of potential sites for

each MC. Having done this, the analyst compares each and makes some initial determinations as to which is most favorable. LOS information also is essential to electronic deception since this operation requires knowledge of where friendly signatures are observed. Figure 4-12 shows terrain masking and horizontal LOS.

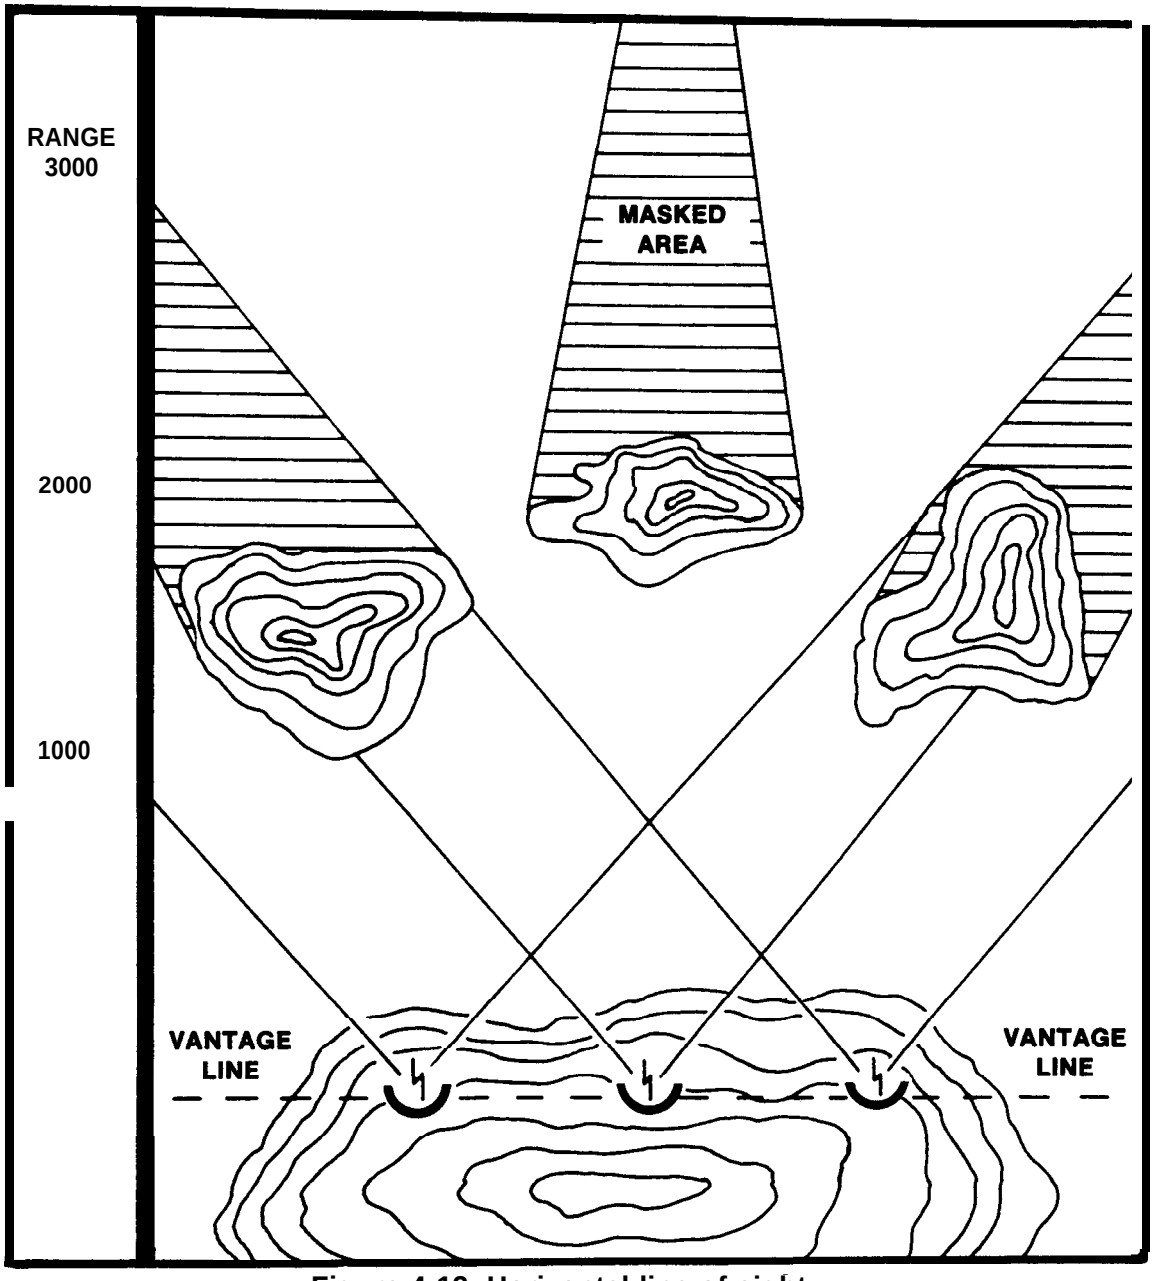

Figure 4-12. Horizontal line of sight.

AVENUES OF APPROACH ANALYSIS

In AA analysis, the intelligence analyst selects the AAs and AAAs that best support the capabilities to move, shoot, and communicate. The analyst considers each avenue in relation to each friendly or enemy capability, and then lists and compares the advantages and disadvantages of each. This is not merely a matter of counting advantages and disadvantages, but requires detai lad analysis and sound judgment.

This analysis is not to determine which AAs the enemy selects, but rather to determine which best supports the capability to move, shoot, and communicate. Figure 4-13 shows how an analyst depicts AAs on an overlay.

Once the most viable AAs are selected, the analyst prepares an overlay depicting each AA and MC. MCS are subsets of AAs and both are shown together. When weather is a consideration, the analyst prepares an overlay for each season.

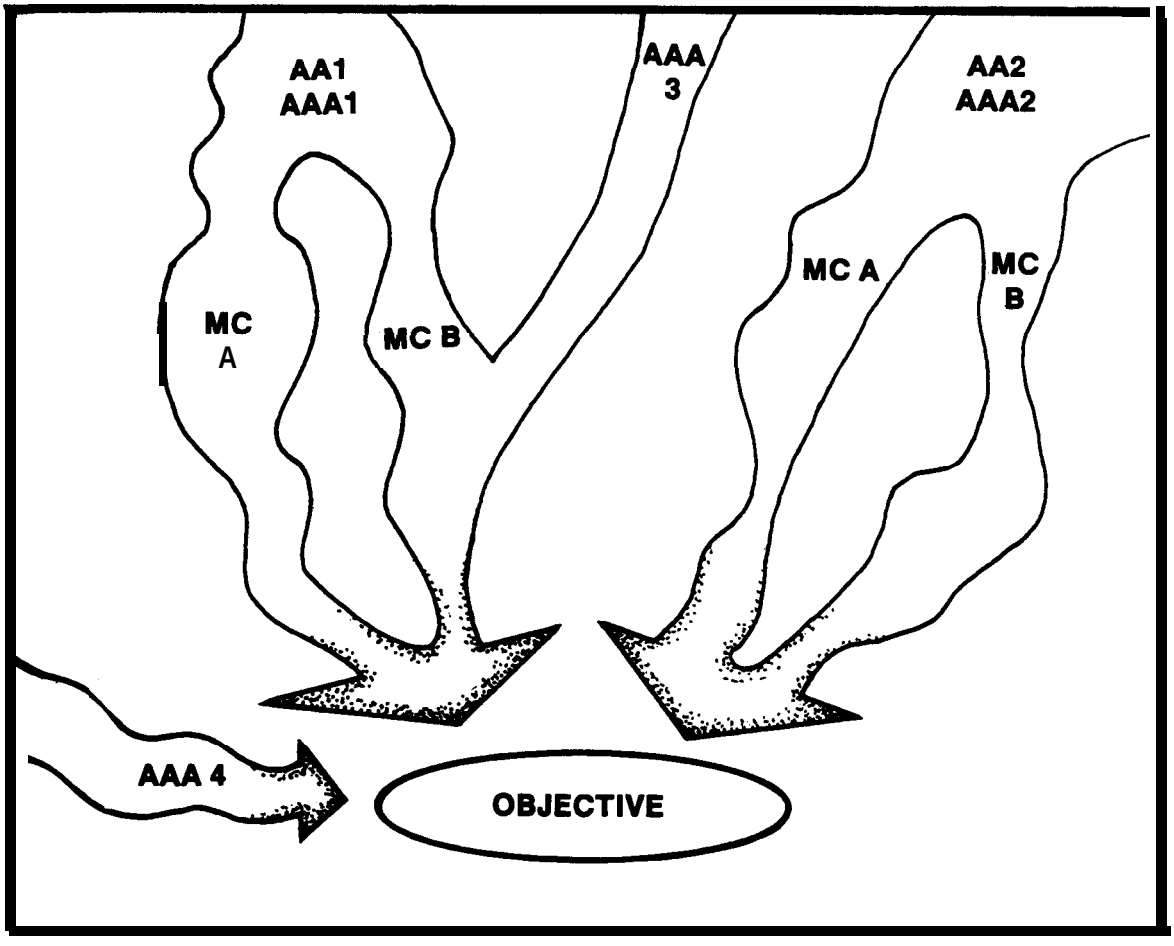

Figure 4-13. Avenues of approach.

APPLICATION OF WEATHER FACTORS OVERLAYS TO ANALYSIS

Similar to terrain analysis, the G2 or S2 produces graphic weather overlays to help facilitate analysis of weather effects on friendly and enemy battlefield operations.

The analyst prioritizes which military effects of weather generally have the greatest impact on the unit and threat force. Time does not allow the analyst to cover all aspects nor to depend solely on the weather teams. Prioritizing becomes critical when operating at battalion or brigade level because there is little time available.

The analyst focuses on each weather factor, examining its effects separately for both friendly and enemy forces. Using weather factor analysis, the analyst identifies specific vulnerabilities and significant benefits which contribute to the command's successful accomplishment of the mission.

The analyst should not generalize weather effects. The analyst should seek details which are useful. The best way to be successful at this is to track weather effects on unit operations during training exercises, catalog these for future reference, and discuss with subordinate commanders what critical weather effects are needed to operate successfully. By doing this, the weather analysis supports operations and the analyst maximizes what little time exists for other IPB requirements.

WEATHER ANALYSIS

Analyzing the climate and weather in the AO helps to determine their effects on friendly and enemy operations. Terrain and weather analysis are inseparable, because the tactical environment requires that climate. weather, and terrain information be considered concurrently. The products of weather analysis are applied in terrain and threat integration.

Weather has a significant impact on both friendly and enemy operations. The weather is analyzed in detail to determine how it affects both friendly and enemy capabilities to move, shoot, and commnunicate. A detailed discussion of weather analysis is found in Chapter 4, FM 34-130.

Weather factor overlays are integrated with the terrain overlays to predict the battlefield araas where friendly and enemy forces can maneuver.

The weather team analyzes climatic data to determine the characteristics of weather in the AO. The terrain team analyzes the effect of weather on tactical operations and, together, the teams integrate weather data and overlays with the terrain analysis and overlays.

The weather analysis team prepares a matrix to define the required analysis and specific weather requirements and determine which overlays are required to support the operation. The matrix isolates militarily significant weather factors and provides the capability to correlate

weather effects with specific combat operations. Examples of weather subfactor overlays produced by the weather analysis team include fog, cloud coverage (summer or winter), rain and snow, and weather effects on slopes. The overlays, along with the combined obstacle overlay, identify where forces maneuver on the battlefield.

At brigade and battalion level the S2 requests those IPB products which address weather effects for their AO from higher headquarters.

Commanders and staffs must understand and consider weather factors in tactical planning. They must recognize the tactical significance of weather effects and the risks or opportunities they present. While considering the effect of weather on all aspects of a mission, the S2 concentrates on weather impact on mobility and LOS. The effects of weather are integrated with the enemy and terrain through IPB; this integration is described in FM 34-81 and FM 34-130. A detailed description of weather effects is in the Weather Effects and Information Handbook (Draft) July 88, USAICS.

Low visibility is beneficial to offensive and retrograde operations and detrimental to defensive operations. In the offense, it conceals the concentration and maneuver of friendly forces, enhancing the possibility of achieving surprise. Low visibility hinders the defense because cohesion and control are difficult to achieve, R&S are impeded, and TA is less accurate. These disadvantages are offset partially by extensive use of illuminants, radar, sound detection, and IR devices. In some instances, using smoke and obscurant aerosols locally reduces visibility. When examining effects of visibility keep in mind friendly and enemy capabilities.

In all operations, restricted visibility prevents or limits the use of aerial systems. The analyst must explain how visibility affects aerial systems.

Wind speed and direction, both on the surface and aloft, usually favor the upwind force. Wind favors the use of either NBC or conventional weapons by the upwind force. Wind of sufficient speed reduces the combat effectiveness of the downwind force by blowing dust, smoke, sand, rain, or snow on personnel and equipment. The upwind force has better visibility and advances easier and faster. Strong winds limit airborne and aviation operations.

Strong surface winds and gusts cause injury to personnel (especially paratroopers in their descent), damage to materiel and structures, false radar returns, and restrictions on visibility by blowing sand, dust, and other materials. Generally, winds above 20 knots create such effects. Smoke operations generally are ineffective at wind speeds greater than 7 knots, As the surface wind increases at low temperatures, either naturally or enhanced by vehicle movement, windchill becomes a critical consideration. The windchill factor adversely affects improperly clothed personnel and impedes activity in unsheltered areas. Wind speed also affects the distance that sound travels. Winds are beneficial because

they improve trafficability by helping dry the soil. A windchill index is available in FM 34-81.

The primary significance of precipitation is its effect on the state of the ground, visibility, personnel effectiveness, and the functioning of some equipment. Ground status affects trafficability; heavy rain makes some unsurfaced roads and off-road areas impassible. Heavy rains make all roads in low-lying areas impassible. Both rain and snow drastically reduce personnel effectiveness by limiting visibility (causing discomfort, increasing fatigue, and creating other physical and psychological problems) and the persistence of chemical weapons thus creating NBC hot spots . Precipitation also adversely degrades the quality of some supplies in storage. Snow accumulation of one inch degrades trafficability and reduces the effectiveness of mines. Generally, more than one inch (2.54 centimeters (cm)) per hour or 2 inches (5.08 cm) in 12 hours of precipitation is considered critical for tactical operations. Snow fall exceeding 2 inches (5.08 cm) in 12 hours, 6 inches (about 15 cm) accumulated on the ground, or drifts of about 2 feet (.6 m) also have a significant effect on operations requiring mobility.

The type and amount of CC, as well as the height of cloud bases and tops, influence both friendly and enemy aviation operations. Extensive CC reduces the effectiveness of air support. This effect becomes more pronounced as CC increases, as cloud bases lower, and as conditions that are frequently associated with clouds, such as icing, turbulence, and poor visibility aloft increase. In relatively unstable air, clouds are associated with strong vertical currents, turbulence, and restricted visibility aloft. Generally, close air support (CAS) and aerial resupply operations require a ceiling of 1,000 feet (305 m) or more.

Clouds affect ground operations by limiting illumination and visibility, They also determine the types, intensities, and amounts of precipitation. Clouds, since they trap incoming heat from the sun and rising heat from the earth, tend to make temperatures near the earth more homogeneous. Temperature and humidity both affect air density. Air density decreases as the temperature or humidity increases; thus, efficiency of aircraft propulsion reduces in areas of high temperature or high humidity. Although temperature and humidity may not directly affect a particular tactical operation, extremes reduce personnel and equipment capabilities, and may necessitate a reduction of aircraft payloads.

Tactics that are effective in one climatic zone may be ineffective if used in another. The high temperatures and humidity found in the tropics are conducive to the growth of dense fol iage, which drastically affects operations. In arctic climates, cold weather periods--

- Create an almost constant need for heated shelters.
- Cause difficulty in constructing fortifications.
- Increase the dependence on logistic support.
- Necessitate special clothing, equipment, and combat skills.

A combination of temperature and wind speed produces a windchill factor . A windchill factor of -26°F (-32°C) is considered the critical value for personnel and equipment operating in cold weather, The opposite extreme, 120°F (49°C), is considered the critical value for personnel and equipment operating in hot weather, Similar restrictions occur in the desert where temperature difference of over 50°F (lO°C) occur between night and day in shelters without air conditioning or heaters.

At division and corps, updating the weather data base is continuous, particularly during periods of increased tension or combat. During these periods, the intelligence analyst compares current and forecasted weather with historic patterns to determine deviations. Updates are forwarded to subordinate commands.

The analyst uses the weather data base as the foundation for analyzing the effects of weather on combat operations. This analysis begins with an evaluation of the mission, threat, Al, and friendly capabilities. While the analyst considers the effects of the weather on personnel and equipment, the primary concern is with their impact on mobility and LOS.

WEATHER FACTOR ANALYSIS MATRIX DEVELOPMENT

The weather factor analysis matrix (see Chapter 4, FM 34-130) assists the analyst in organizing the analysis task, defining Specific weather requirements, and determining what weather factor overlays are required to support mission planning. The matrix isolates those weather factors that are militarily significant and correlates their effects with specific combat operations and supporting functions.

THREAT EVALUATION

During the threat evaluation phase, the intelligence analyst examines enemy forces utilizing the nine OB factors.

The objective for the intelligence analyst during this phase is to determine enemy capabilties, vulnerabilities, and strengths. Also the analyst determines how the enemy would operate doctrinally If not restricted by terrain and weather. The G2 or S2 analyzes the enemy based on known information maintained in the enemy OB file. Information gaps identified are translated into RIIs and sent up the intelligence chain to be answered. Maintaining a detailed enemy OB file is a continuous process. The S2 section maintains one for each of the unit's contingency and normal operating areas. The intelligence analyst uses the enemy OB together with current information and the mission to develop an HVT list.

The S2 and staff develop an HVT list by imagining how the enemy would fight, relative to the friendly force mission. The S2's or analyst's goal is to identify enemy assets an enemy commander would consider valuable or critical for the accomplishment of the mission. In thinking through the enemy plan an analyst considers how the friendly element's mission and intent affects the enemy mission.

For example, if an analyst is thinking through an enemy attack and knows that the friendly force is in prepared positions with extensive obstacles and barriers throughout the perimeter, it is a logical assumption that the enemy commander will want substantial engineer support to breach friendly obstacles. The enemy commander may not be aware of the obstacles, yet engineer assets in fact are critical to the enemy battle plan. Enemy engineer units therefore become HVTS. The G2 or S2 provides this and other HVTS in the form of a HVT list to the G3 or S3 and the FSE so target priorities are established and planned for.

By analyzing probable enemy actions, the analyst enhances the probability of mission success by determining HVTS which can become enemy vulnerabilities if acted on by the G3 or S3 and the FSE.

The analyst develops doctrinal templates during the threat evaluation phase. Before creating doctrinal templates, the analyst determines which enemy echelon is the focal point for analysis. US commanders are interested in enemy echelons one level above their own because that is the enemy echelon that directs a battle against them. Enemy maneuver elements are templated for units two echelons below that of the US commander, because those are the ground force units in direct contact with the unit.

Knowledge of enemy doctrine provides a starting point for doctrinal templates. For example, doctrinal templates may be required to reflect the sequential order of an enemy unit in the attack from its assembly area to the ultimate objective. The sequence may be as follows:

- Tactical march formations.
- River crossing (hasty, deliberate) .
- Breakthrough.
- Envelopment.
- Exploitation.
- Pursuit.

One method of determining which operations and units should be templated is to develop a matrix. The matrix shows which types of operations and units that are expected to be encountered and provides a clear record of what has been determined. Figure 4-14 showa an operations or unit matrix,

It is also important to prepare doctrinal templates of battlefield functional systems. The functional system templates generally expand information that is reflected in the primary doctrinal templates. For example, a template depicting an enemy division in a river crossing is expanded by a subset depicting the deployment of engineer bridging and pontoon equipment.

Again, not every possible enemy action and subset is templated.

Types of Operations / Types of Units	Movement to Contact	Meeting Engagement	River Crossing	Attack Against a Defending Enemy	Pursuit
Motorized Rifle Division	X	X	X	X	X
Motorized Rifle Regiment	X	X	X	X	
Motorized Rifle Battalion		X	X		X
Independent Tank Battalion			X	X	X
Tank Division	X	X	X	X	X
Tank Regiment	X	X	X	X	X
Tank Battalion		X	X		

Figure 4-14. Operations or unit matrix.

A matrix is an easy way to lay out the information to be analyzed and recorded, Using a matrix, the analyst looks for those battlefield functional systems in certain types of operations that tell the most about how the enemy operates in relation to the mission. Figure 4-15 shows the types of operations on a battlefield functional systems matrix.

THREAT INTEGRATION

The objective of threat integration is to integrate enemy doctrine with the terrain and weather analysis done in previous IPB phases. This further reduces uncertainty as to how the enemy fights. Members of the staff analyze potential courses of action during this phase to advise the commander of the best course of action to accomplish the mission.

To assist the staff, the G2 or S2 produces situation, event, and decision support templates. FM 34-130 provides a detailed description on how to prepare these templates. This chapter discusses how the analyst should apply these templates in order to support the staff planning process.

SITUATION TEMPLATE

The situation template depicts how the enemy adjusts doctrine to terrain and weather effects throughout the battlefield. Knowledge of enemy doctrine is critical to developing and using situation templates for analysis.

Types of Operations / Types of Battlefield systems	Tactical March Formations	Meeting Engagement	River Crossing	Attack Against a Defending Enemy	Pursuit
Tactical Rockets and Artillery	X	X	X	X	X
AD	X	X	X	X	X
Communications	X	X	X	X	
REC		X	X	X	X
Missiles				X	X
Reconnaissance	X		X		X
Rear Services			X	X	X
C^3 of MRD	X	X	X	X	X
C^2 of MRR	X	X	X	X	X
Engineers	X		X	X	X

Figure 4-15. Battlefield functional systems matrix.

During this phase the analyst takes doctrinal templates and visualizes where the enemy force will place assets on a particular point on the ground. By doing this, MCS within each AA become apparent.

As enemy forces move along AAs and MCs, they do so sequentially. The analyst follows the enemy by sequentially and situationally templating their movement.

Because of time constraints, apply situation templating initially to critical areas on the battlefield. These are based on the friendly force mission and what the commander feels are critical battlefield points and areas. By applying situation templates the analyst usually depicts expected enemy movements along an AA for the commander and staff. This contributes to the planning process by allowing the commander to get a "visual feel" for the enemy's plan.

PRIORITY INTELLIGENCE REQUIREMENTS

PIRs are the expression of the commander's information needs. When recommending PIRs, the intelligence analyst keeps in mind the commander's intent. The analyst limits the PIR to a few questions. These PIRs must seek answers to questions critical to the successful accomplishment of the unit's mission.

While PIRs are general in nature, they must be specific enough to identify the critical information required. For example if the brigade is preparing defensive positions in anticipation of an attack, then a PIR could be: When will the enemy attack? A more specific PIR would be: When will the enemy attack and where is the main effort? This PIR, if answered, helps the commander prepare a more effective defense particularly if time is short. Knowing where the main effort is helps the commander prioritize defensive preparations.

EVENT TEMPLATE

Situation templating is the basis for event templating. Event templating is the identification and analysis of significant battlefield events which provide indicators of an enemy course of action. It is a projection of what most likely will occur if the enemy adopts a particular course of action. By knowing what the enemy can do and comparing it with what the enemy is doing, it is possible to predict what the enemy will do next. Because there are normally several courses of action which lead to the enemy's objective, each must be identified. Event templates are then developed for each course of action. This is because the enemy course of action which the analyst identifies as the most probable may not be selected for reasons of deception or other factors known only to the enemy. The analyst must be able to shift attention quickly between courses of action during the battle.

The event template is a critical analytical tool for determining the enemy's posture and movement. Knowledge of when and where enemy activity is likely to occur on the battlefield provides indicators of enemy intentions. Indicators may be negative (that is, things that do not happen may be just as critical as what does happen). The projection of battlefield events occurs through situation development during the prehostility or predeployment phase of the IPB process and is verified or refuted during combat operations.

While visualizing the enemy force moving along an AA or MC, critical areas become apparent. These areas are significant because they are where significant events and activities should occur. If the analyst's hypothesis is correct, it is within these areas that targete appear. The intelligence analyst designates these areas as named areas of interest (NAIs) .

An NAI is a point or area, often along an identified MC, where enemy activity (or inactivity) confirms or denies a particular enemy course of action. NAIs also fall outside of a MC. For example, there may be activity on key terrain, such as high ground, in support of movement on an adjacent MC.

The event template and its NAIs are the basis for intelligence collection, R&S, and analysis because they--

- Focus attention on areas where the enemy force must appear if it uses a particular MC.

- Frame militarily significant events by time and location within an NAI.

- Compare events in one NAI with events occurring in the NAI of other MCs to determine enemy intentions.

It is important to develop event templates as quickly as possible. Refine them further as time permits. Early preparation permits quick development of an R&S plan. R&S assets are focused on NAIs to obtain the greatest payoff in relation to limited assets. The primary goal of an analysis is to apply the event template to the collection of information which supports the mission planning effort.

EVENT ANALYSIS MATRIX

The event analysis matrix (EAM) supports the event template. It correlates the expected events and activities within each NAI and adds the dimension of time. Through analysis of enemy doctrinal movement rates and the effects of the terrain and weather on their mobility, estimate the time required for the enemy to move between NAIs.

The analyst prepares an EAM for the primary AA and each MC within it. Figure 4-16 shows a sample EAM. Due to time limitations and staff size, most EAMs are prepared at division level or higher.

Before combat, the EAM and event template illustrate possible enemy courses of action as a basis for comparing friendly courses of action. During combat operations, they focus on enemy probable courses of action.

Event templating enables the G2 to develop precise collection requirements, maximizing the effectiveness of limited resources over extended areas against a vast array of enemy targets. It assists the intelligence analyst in determining where to look, when to look, and what to look for. Situation and event templates enable the collection manager to establish collection priorities based on those courses of action the enemy is most likely to adopt. Framing movers and emitters, the primary indicators of events and activities, in time and location, allows the collection manager to determine the optimum mix of collection sensors.

Event templating also serves the G3 by telling--

- Where and when to shoot, jam, and maneuver.

- What to shoot, jam, and maneuver against.

Event templating is the vital link between the success of the commander's tactical concept and intelligence requirements and the collection, planning, and execution needed to fulfill those requirements.

DECISION SUPPORT TEMPLATE

The DST is a logical extension of event templating; it relates events of the event template to the commander's decision raquirements. The DST

is not the sole responsibility of the G2 or S2. Production of the DST and synchronization matrix is a shared responsibility, involving the entire staff or their representatives. The G2 or S2 provides information about the enemy. The G3 or S3 guides the effort and ensures that it supports the commander's intent.

A properly prepared DST portrays the enemy's most likely course of action and possible target areas of interest (TAIs) along with time phase lines (TPLs). It also depicts decision points (DPs) which relate to the use of fire, maneuver, and CSS.

Target Areas of Interest

Areas along each AA and MC where the comnander influences the enemy through fire and maneuver are TAIs. The TAIs are normally areas which were earl ier identified as NAI. They are areas where we delay, disrupt, destroy, or manipulate the enemy force. They are also areas suitable for attacking HVTS.

A TAI is an engagement area or point, usually a long an MC, where the interdiction of enemy forces by maneuver, fires, or jamming deprives or reduces a particular enemy capability. It also may cause enemy forces to abandon or require the use of unusual support to continue operations. In the latter option, TAIs are terrain-dependent to inhibit or deny movement.

Sample TAIs include--

- Key bridges.
- Road junctions.
- Choke points.
- DZS and LZS.
- Known fording sites.

The TAIs are significant because they constitute a basis for allocation of attack resources. The identification of TAIs is a joint effort of the intelligence, operations, and FSE staffs. The intelligence staff evaluates enemy forces and the effect of interdiction on their capabilities. The operations staff and FSE consider the availability of interdiction resources, the effects of interdiction on the accomplishment of friendly missions, and priorities for the use of available resources.

Part of determining TAIs involves target value analysis (TVA). TVA is a joint activity of intelligence, operations, and FSE personnel. Through analysis of enemy doctrine, TVA names and provides the basis for locating enemy elements which are key to the enemy's success. These enemy elements are known HVTS.

A second category of targets is the HPT. Destruction of an HPT is advantageous to friendly operations. The commander designates the HPTs. For example, suppose the enemy must cross a wide, deep river in a friendly sector as part of a probable attack. Enemy engineer assets are very important to the enemy commander's success. The engineer units and equipment are HVTs because without them the river crossing is impossible. The friendly commander, briefed on this HVT, designates the enemy engineer assets as HPTs because their destruction is of great value to the friendly defense plan. This particular HPT is prioritized among other HPTs for location by intelligence personnel and subsequent attack by lethal and nonlethal means.

An analyst must have an in-depth knowledge of enemy doctrine to determine potential HVTS, CPS, missile units, and logistics points on situation and event templates. This knowledge helps in cueing collection assets to possible HVT locations designated as TAI for the DST.

Decision Points

Following the selection of TAI, the analyst identifies DPs. The availability and capability of friendly fire and maneuver systems largely influence the location of DPs; therefore, their selection is primarily a G3 or S3 function. However, this task requires the efforts of both the G3 or S3, the G2 or S2, and their respective staffs.

DPs identify those battlefield events which may require tactical decisions and the no-later-than time when these decisions are made for the commander to retain available options. Decisions are made early enough to ensure implementation in time to achieve the desired effects; however, they cannot be made until there are indications that particular battlefield events will occur and their locations determined with a high degree of confidence.

DPs associate projected enemy locations with specific points on the battlefield. Comparing times required to implement decisions, enemy movement rates, and distances determine DPs. For example, if it requires two hours to implement a decision, it must be made while the enemy is at least two hours from the TAI where the event will occur. These decisions include more than fire and maneuver; they also include decisions such as donning mission oriented protective posture (MOPP) gear, and employing smoke. Enemy doctrinal movement rates that the analyst develops are adjusted to compensate for the effects of the terrain, weather, and friendly action on mobility. They provide the basis for computation.

The DST depicts the TAI and DPs. Figure 4-17 shows a sample offensive DST with synchronization matrix.

Decision Support Matrix

A decision support matrix supplements the DST. This matrix relates each DP to the event or associated TAI or NAI requiring a friendly reaction. Decisions are made by the time enemy forces pass DPs or a set of options which were available are negated. Other information from the IPB data base, like enemy composition and probable deployment, supports the DST.

Intelligence provides a basis for tactical planning and execution. Detailed planning is accomplished during the static period, as an 8- to 10-day battlefield scenario does not allow time for detailed planning. Event and decision support templates are the results of detailed intelligence planning that is accomplished during static conditions. They are the basis for all tactical planning. These templates are the filters through which all information and intelligence are directed to the commander. They are relevant to the commander's needs, as expressed in PIR and IR, because they are keyed to important battlefield events and

time and space factors known to be of interest to the commander. The DST is the vital link between the conmmander's intelligence needs and the resultant actions the commander and staff require.

The commander is vitally concerned with wresting the initiative from the enemy commander; that is, forcing the enemy commander to choose a less desirable course of action through design rather than chance. The DST frames the commander's opportunities and options and ensures timely and accurate decisions. This provides the means to influence enemy actions rather than just react to them.

INTELLIGENCE PREPARATION OF THE BATTLEFIELD DURING PEACETIME

This chapter has emphasized the vital role that IPB plays in preparing for the next battle. During peacetime, IPB builds an extensive data base for each potential area in which a unit is required to operate. It analyzes this intelligence data base in detail to determine the impact of the enemy, weather, and terrain on operations and presents this information graphically. IPB is initiated any time the commander faces a new enemy or receives a new mission. It is a continuous process which supports planning and execution for all operations.

CHAPTER 5

ANALYSIS IN DEPTH

Analysts do not find intelligence. Analysts develop intelligence through evaluating, assessing, integrating, and interpreting information. This intelligence focuses on the commander's needs. It must support the commander's decision to concentrate or disperse forces on the battlefield. It must provide information to assist the commander in targeting and defeating the enemy. This chapter addresses some of the techniques and tools which the intelligence analyst uses to manage intelligence production.

Analysts face daily problems. These challenges vary from the simple, such as finding information, to the complex, such as predicting specific enemy courses of action. The analyst makes decisions regarding what, how, and when the commander can use information to support the battle. This information often means the difference between winning and losing on the battlefield, so it is vital that analysis be both accurate and timely. This information and analysis influences decision making. Although the analyst does not make decisions for the commander, the commander cannot make qual ity decisions without' the information that analysts provide.

MEETING USER REQUIREMENTS

The ultimate user of intelligence is the commander. The analyst produces intelligence that the user specifically needs. Through stated PIRs and IRs, the commander drives intelligence production and focuses efforts. The commander's IRs often pertain to varied areas on the battlefield. For example, intelligence required to support the rear battle is different from that required for the deep battle. Different staff sections require different information, yet all of this supports the commander's needs on the battlefield.

It follows then, that to satisfy user requirements, the analyst must understand what those needs are. Figure 5-1 lists some of the factors which an analyst should consider in developing an intelligence product. If the analyst and the user do not look at information or problems from the same perspective, the intelligence will not support requirements.

As a simple example, suppose the user asks for a list of locations where a river may be bridged. The analyst considers the enemy's tanks, which weigh about 40 tons, and provides such a list. If the user plans to cross these bridges with American tanks, which weigh about 60 tons, the list of locations is useless. Clearly, the analyst has failed to understand the user's needs.

In the tactical environment, the analyst and the user see the mission as fighting the same enemy in a specific geographic area. From the knowledge each has about the tactical situation, both develop conceptual mode ls, The analyst and the user create some type of theoretical

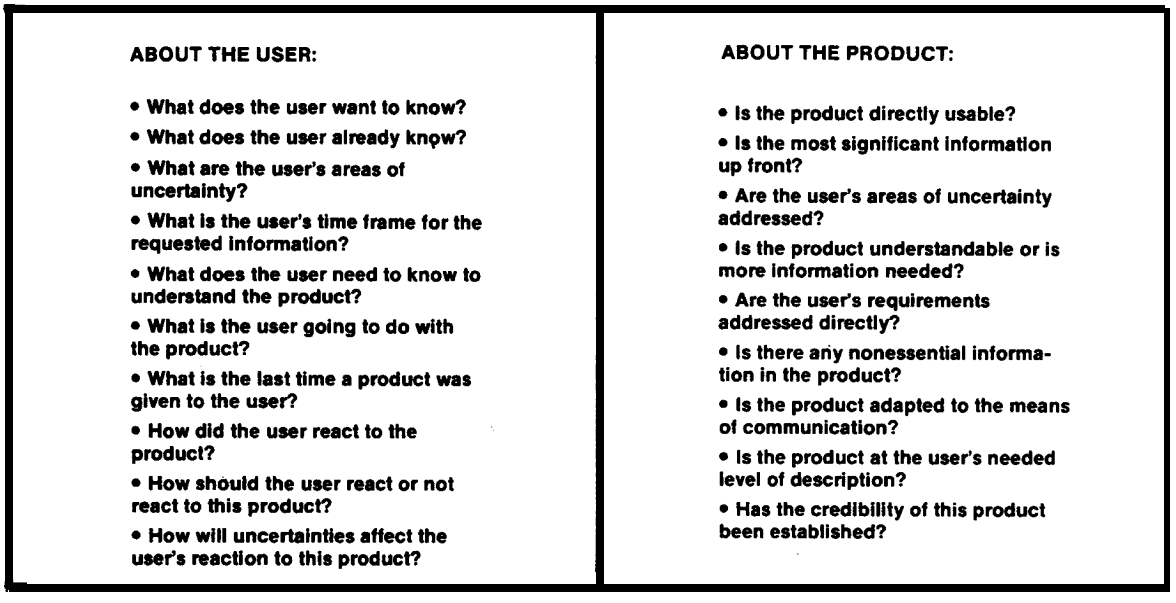

Figure 5-1. Developing an intelligence product.

representation of the tactical situation. These conceptual mode Is have common factors wh ich both anal yst and user share. These common factors are termed "a shared conceptual model ."

Without a shared conceptual model, the user and analyst cannot communicate. Effective communication allows the analyst to understand the user's requirements and to tailor the product to them.

Communication allows analysts to interpret what the user wants and fill in any missing intelligence pieces. This is easily done through feedback.

Feedback greatly improves the quality of any intelligence product. If user and analyst communicate during the development of a product, the shared conceptual model is refined. This allows the analyst to orient on those areas important to the user and to eliminate nonessentials. Refinement of the "model'" sensitizes the analyst to areas of uncertainty and the criticality of time in a given situation. The analyst, in turn, al lows the user to understand the risk inherent in any estimate and the basis for assumptions made.

Face-to-face communication is the best form of feedback. It is also the best way to develop a shared conceptual model. Ambiguous words or ideas can be instantly clarified, pictures or sketches can be drawn, and maps consulted, When face-to-face communication is not possible, the analyst speaks with staff officers or other representatives of the user. If a standard of performance has been established or is described in SOP, the analyst uses this as a measure of current efforts.

DETERMINING THE RISK FACTOR

Uncertainty is what the job of intelligence is all about. To succeed, the analyst handles uncertainty from a number of sources. While objective ground truth is found in the laboratory, it is not part of analysis of the battlefield. The analyst frequently deals with ambiguous or even misleading information.

The analyst's greatest concern is uncertainty, the commander's is risk. Good analysts translate uncertainty into risk. Figure 5-2 shows a graph of risk functions to consider. Risk increases as enemy lethality moves from low to high. When a range of uncertainty is added to the estimate of lethality, the potential danger becomes even greater. The degree of risk a commander will accept governs the amount of uncertainty the analyst reports.

For example, under a very high level of uncertainty, the commander faces between one and three enemy tank divisions. The analyst admits the level of uncertainty involved, while collecting and processing information to reduce the uncertainty. The level of uncertainty that the analyst

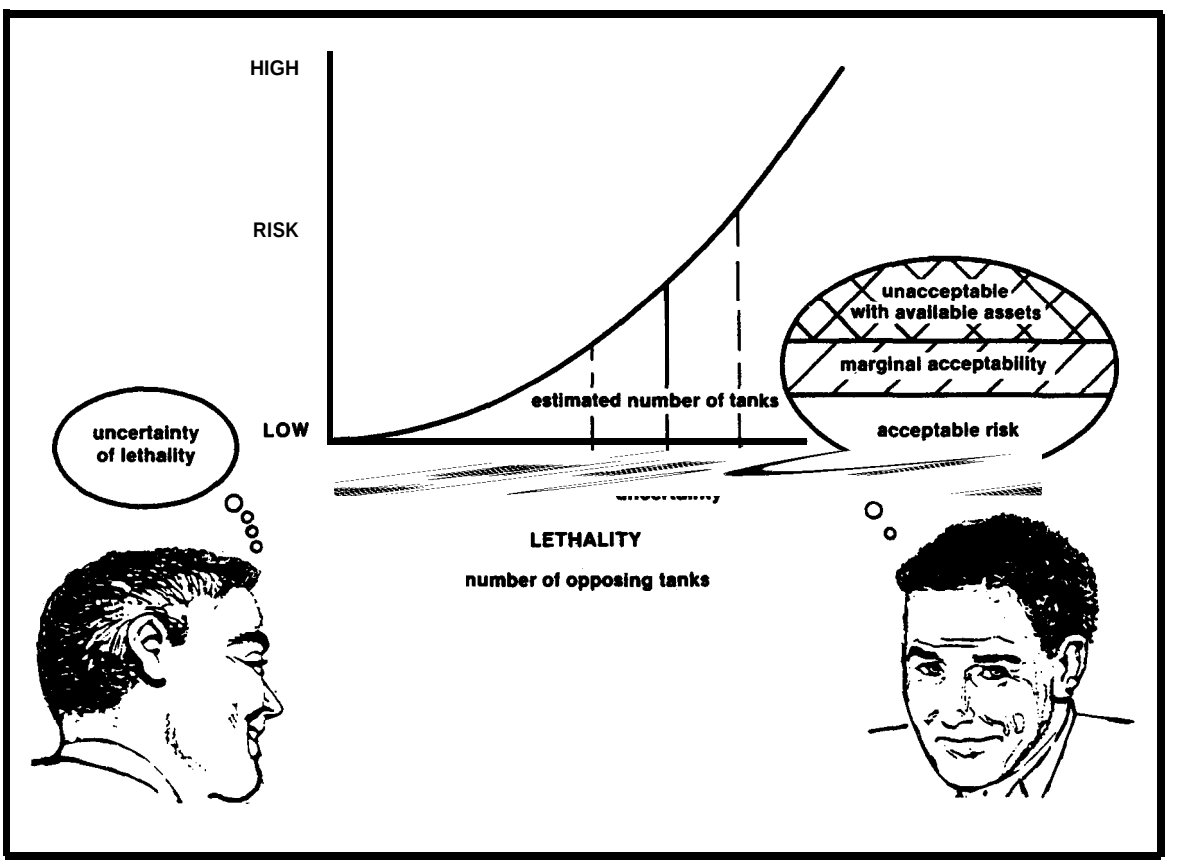

Figure 5-2. Translating uncertainty to risk.

accepts is driven by the degree of risk the commander accepts. The commander is unable to properly plan for battle knowing only that friendly forces face "between one and three enemy tank divisions". The same commander is not concerned about facing 10 or 12 enemy tank battal ions; the commander employs the same plan regardless, in facing 10, 11, or 12 battalions. The analyst does not waste time reducing the level of uncertainty beyond reporting "1O to 12 tank battalions" because the commander is satisfied with the given degree of risk.

Risk is a voluntary exposure to danger, however unavoidable it might be under the circumstances. In combat, there is always risk in not preparing response to a potential enemy action whether or not that action has a high possibility of execution. Risk increases in response to potential danger and decreases when the enemy threat credibility goes down.

Risk increases when--

- Enemy force lethality increases.
- Warning time decreases. (Crises occur when warning time is less than the required preparation time; the worst-case situation is when there is total surprise and no warning.)
- The number of enemy options increases. (If the enemy's plans are ambiguous, then friendly forces might not plan effective responses to all of the enemy opt ions.)
- The number of friendly options decreases. (If fewer options are available for countering the threat, there is a greater chance that the available options will not work.)
- The enemy's knowledge of the battlefield environment, including friendly forces increases.

Risk decreases when--

- The enemy force lethal ity decreases.
- There is greater warning time.
- The enemy has fewer options.
- The number of friendly force options increases.
- The friendly force knowledge of the battlefield environment, including enemy forces, increases. Knowing how the environment affects combat operations allows the commander to exclude unworkable courses of action and to gain maximum effectiveness from others.

The analyst's uncertainty plays a key role in the evaluation of the enemy and the amount of risk accepted. Uncertainty may arise for many

reasons. First, there is uncertainty about the enemy's intent: "What is the enemy's real objective? What are the various means of achieving this objective?"' Second, there is uncertainty in evaluating the capabilities of the enemy force to achieve these objectives. Third, there is uncertainty in other factors (lethal ity, warning time, enemy and friendly options, and environmental conditions). Fourth, there is uncertainty that the method of response will produce the desired outcome.

THE THREAT MODEL

The threat model is a portrayal of the enemy. It allows the analyst to piece together information, identify information gaps, speculate and predict, and do problem solving. Most importantly, the threat model allows some of the risk in a given situation to be quantified. There will always be inaccuracy in a model, and so there will always be uncertainty. Still, based on the model, an analyst can look for changes in a real-world situation to identify patterns, trends, and activity levels. Creating such a model requires a knowledge of--

- Physical objects such as weapons, vehicles, and radar.
- Organizational structures of enemy and friendly forces.
- Battlefield environment, including terrain, hydrology, and weather.

Once developed the model is refined and maintained, or it will lose its validity.

Threat models incorporate white elements (battlefield geography and environment conditions), red elements (the enemy force (or threat), and blue elements (the friendly force). The three elements of white, red, and blue form an organizational structure from which the analyst can mentally picture the battlefield. Figure 5-3 illustrates elements of the threat model.

Thinking white is understanding the elements of the environment as they affect the battle. In threat modeling, development of the white framework comes first. It is the white framework that anchors the threat model to the real world. The white framework is made up of space and time.

Developing the geographic framework of the battlefield is as simple as plotting the battlefield on a map. The dimensions of the battlefield encompass the unit's AO and AI.

The map is a model of the real world. The topographic map contains a wealth of information about the battlefield environment, including descriptions of terrain, roads, and population centers. The highly detailed military map contributes more information to the threat model.

Time in the threat model is a sequence of time-period snapshots (or windows) within which events occur. The analyst compresses threat model

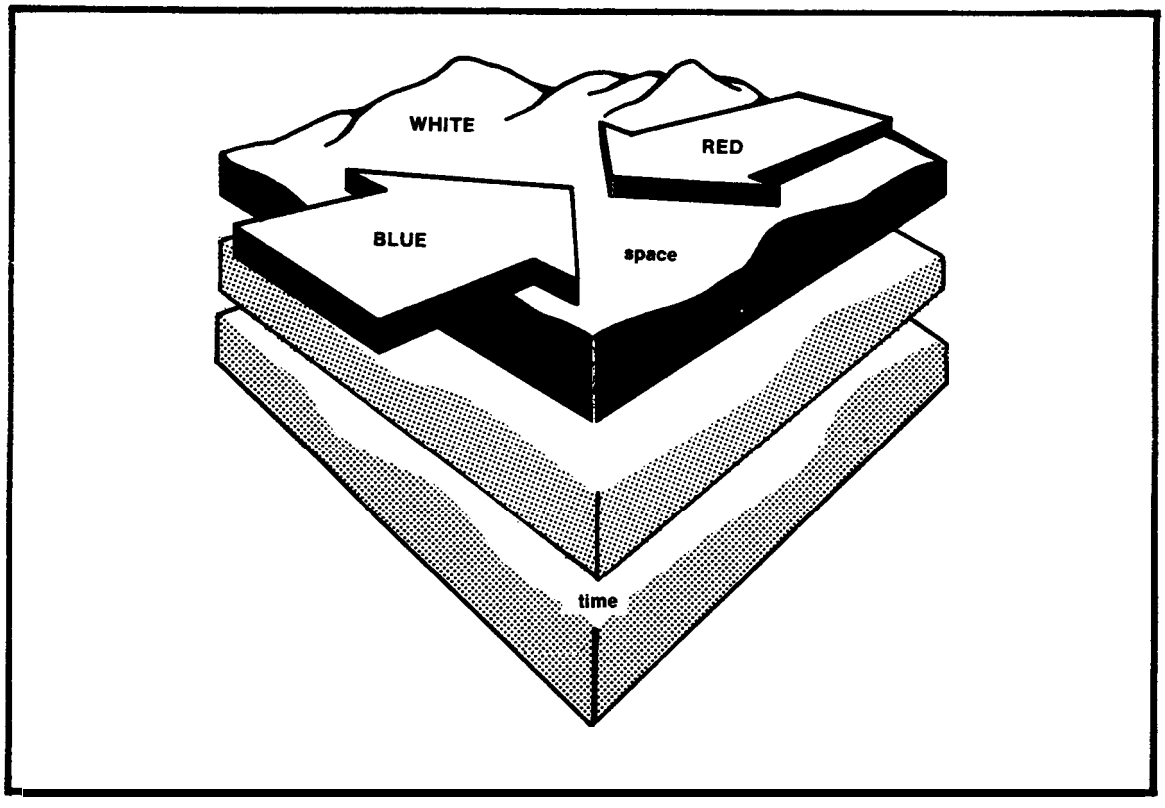

Figure 5-3. Elements of the threat model.

time to bring events closer together or expand it to make individual events more distinguishable. Overlaying time windows helps in seeing patterns of events or distinguishing changes. In the threat model snapshot sequence, one of the snapshots represents the current time frame. A sequence of snapshots al lows the analyst to fol low courses of action from the current time frame to the eventual outcome of the battle. Each snapshot represents an overlay of information on the battlefield geography. Figure 5-4 shows this.

Thinking red is seeing the battle from the enemy's viewpoint. The red element of the threat model is anchored in the real world. Enemy forces use the political and military policies of the foreign nations involved. The enemy combat force is an extension of political policies that are the source of the conflict that creates the battlefield situation.

Next, in threat model ing, plot the red element, including locations and likages of the political, military, and combat organizations on the battlefield. The highest echelon of enemy organization plotted depends on the echelon of interest to the friendly force commander. For example, the strategic-level threat model has all aspects of the civil ian and mil itary

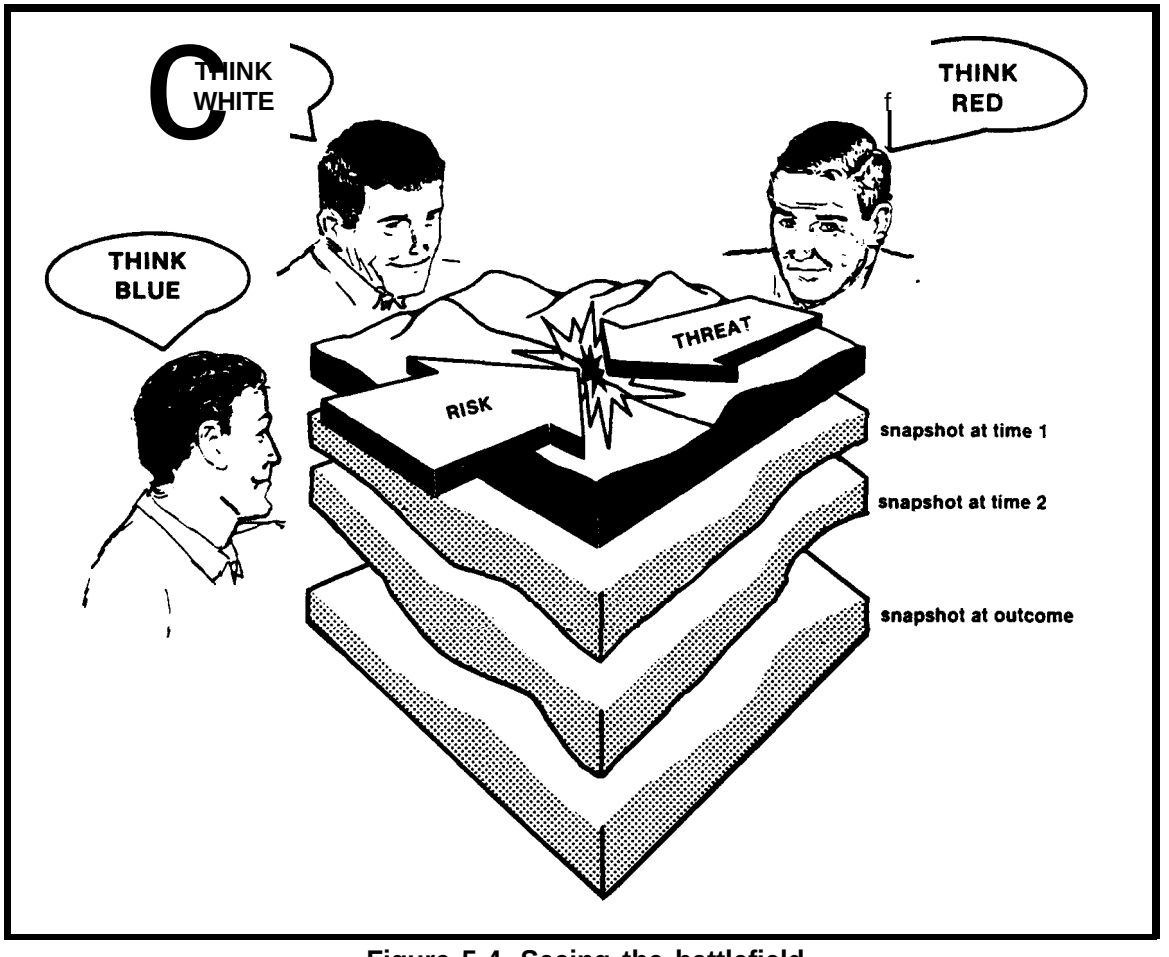

Figure 5-4. Seeing the battlefield.

force structure, whereas a division-level threat model shows only the locations of the red forces up to army level.

The organization of red elements follows some form of hierarchical structure, connected by lines of communication (LOC). The LOC shows the relationships between units for command, control, and coordination. The LOC is overlaid on the geographic structure and relates to physical communication paths like roads, transmission lines, or electromagnetic transmission paths. Figure 5-5 shows the three techniques.

Thinking blue refers to seeing the battle from the friendly commander's point of view. The threat model takes on its full meaning when the blue element is introduced along with white and red. The targets of red threat are blue elements; the components of the friendly force are blue elements.

Fill out the RED War Plan with three techniques:

1. **Start with enemy doctrine to structure the war plan.**
2. **Exploit intelligence sources to fill in details.**
3. **Use analogies to fill in missing information.**

Figure 5-5. Red elements three techniques.

The most common failing of analysts is their inability to "think blue". Analysts become extremely knowledgeable about the enemy, knowing nearly exact numbers of equipment, biographies of commanders, and unit histories, but they cannot see how friendly forces operate. It does little good to understand enemy aviation without understanding some of the characteristics of friendly air defense. While there are staff officers who are experts in friendly systems and tactics, the analyst must still have a familiarity with blue doctrine and tactics. This returns to the need for a shared conceptual model.

In plotting the location of units in the white framework, the analyst is concerned with the location of those combat units that information from the threat model supports. Figure 5-6 lists some information sources for developing the blue element of the threat model.

- **Operations plan for the friendly force.**
- **Friendly force doctrine.**
- **Mission plans.**
- **RED view of friendly forces.**
- **Situation reports from operational elements.**
- **Mirror imaging.**

Figure 5-5. Information sources for developing the blue element.

Figures 5-7, 5-8, and 5-9 show checkl ists of white, red, and blue questions that are asked when creating the threat model.

What is the geography of the battlefield?

What is the culture of the country area?

What is the history of conflicts in this region?

What is the attitude of the local population toward the enemy force? toward the friendly force?

What is the academic, economic, and technological level of the local population?

How is the local population armed?

How is the population distributed in the region?

What local cultural features (airfields, railways) can be exploited for military purposes?

How predictable is the weather in the area?

How does the weather affect operations, personnel, trafficability, equipment, and communications?

During what time frame will hostilities occur?

How much time is available for preparation?

Figure 5-7. Checklist of white questions.

What is the enemy's doctrfne?

What are the enemy's tactics?

How does the enemy prepare war plans?

How does the enemy train?

What are the enemy's objectives?

How is the enemy equipped?

What is the enemy's strategy?

How is the enemy force sustained?

What are the enemy's operational plans?

How is the enemy force structured?

What are the enemy's courses of actions?

Figure 5-8. Checklist of red questions.

What are the BLUE principles of war?	What resources does the have at his disposal?
What are the friendly objectives?	What are the priority information needs of the commander?
What are the friendly force resources?	What are the information needs to execute the mission?
What is the commander's mission?	

Figure 5-9. Checklist of blue questions.

Given a model of how the battlefield should appear in a certain situation, the analyst develops and tests hypotheses of how the enemy may act. An hypothesis is an explanation that accounts for a set of facts and that can be tested by further investigation. It is a set of logically related propositions and an outcome. An hypothesis can be proven false based on evidence, but it can never be proven correct in advance. The best that the analyst can do is rank order several hypotheses or assign rough probabilities to them, Whan seeking evidence to support or reject a hypothesis there are several considerations for the analyst:

- The enemy can be engaged in deception. The course of action selected by the enemy does not have to be the best, but only adequate. Deception efforts then can be mounted which support the most obvious course of action.
- Sensors can collect only in the areas where they look. If targeted at one specific area, they may not collect information in another. This information not collected may have confirmed or denied a particular course of action.
- Indicators may be redundant to several hypotheses,
- Several sensors may collect the same piece of information. This can give undue weight to a hypothesis.
- Some small indicator may be vital to a certain course of action. Large scale river crossings, for example, require engineer support. If that support is conclusively absent, a river crossing cannot occur, no matter what else supports that hypothesis.
- The evidence gathered in one area may not be representative of the whole battlefield. For example, the enemy has 15 battalions of artillery available. Sensors report 4 battalions in the north and 2 in the south. This does not conclusively indicate a total of 10 battalions in the north and 5 in the south. The true disposition may be 4 in the north and 11 well camouflaged battalions in the south .

When selecting an hypothesis as "most likely" or rejecting it out of hand, all of the above issues come into play. These errors in thinking may lead to false alarms or rejecting perfectly good ideas. Other errors also exist which affect analysis. They are called biases.

BIASES

If a single term best describes the factors that interfere with successful analytic thinking, it is bias. A bias is a subjective viewpoint. It indicates a preconceived notion about something or someone. Analysts must recognize biases and be aware of the potential influence they can have on judgment.

Biases can have a positive influence on analysis. With a iack of information, a preconceived notion gives a starting point for thinking about a situation. However, biases are generally bad because they obscure the true nature of the information. The analyst must recognize several categories of biases so as not to be misled or drawn into the wrong conclusions during the analysis process. Biases are cultural, organizational , personal, and cognitive (perception).

CULTURAL BIASES

Cultural biases begin forming at an early age and continue throughout a lifetime. They interfere with the ability to think in the same manner as the enemy (think red). Analysts need considerable background information on culture and social mores to perceive a situation In the same way the enemy perceives it. If analysts do not have this experience or information and decide to depend upon their own values when looking at a situation, the analysis is likely to be wrong. The reason for this is that different cultures tend to view similar situations differently.

ORGANIZATIONAL BIASES

Most organizations have specific policy goals. Any analysis done within these organizations may not be as objective as the same type of analysis done outside the organization. Some of the problems that occur from a subjective internal analysis range from an unconscious altering of judgment because of exposure to selective information and common viewpoints held among individuals, to deliberately altering a judgment to provide what the commander wants to hear. "Best case" analysis is a good example.

"Best case'" is where an analyst preeents the situation in the most optimistic light so as not to anger the commander. This frequently underestimates the enemy's capability while overestimating friendly capability.

PERSONAL BIASES

Personal biases come from past experiences. If a thought pattern previously led to success, analysts may continue to follow this pattern.

Even if the situations have nothing in common, the tendency to follow the methods that were successful in the past is very strong.

COGNITIVE BIASES

The all-source analyst evaluates information from a variety of sources (including HUMINT, SIGINT, IMINT, and open sources). Each source has strengths and weaknesses. The degree of reliability, completeness, and consistency varies from source-to-source and even from message-to-message. This variance often creates doubt about the reliability of some sources.

The cognitive biases that cause analysts the most problems are vividness, absence of evidence, oversensitivity to consistency, persistence of impressions based on discredited evidence, and availability.

Vividness

Clear and concise information has a greater impact on thinking than abstract and vague information. Even if the vague piece of information has more value as evidence, the tendency is to disregard faster than you would eliminate a clear piece of information.

Absence of Evidence

Lack of information is by far the most common problem, especially in a tactical environment. This does not mean that analysts should be content with the information on hand; they always want more. Analysts shouldn't hold back information because it is not conclusive. It rarely is. Instead the analyst should--

- Realize that information sometimes is missing.
- Identify areas where information is lacking and consider alternative hypotheses.
- Adapt and adjust judgments as more information comes in.
- Consider whether a lack of information is normal in those areas or whether the absence of information is itself an indicator.

Oversensitivity to Consistency

Consistent evidence is a major factor for confidence in the analyst's judgment. On the one hand, consistent information is appropriate. On the other hand, information may be consistent because it's redundant, or it may come from a small or biased sample. The analyst considers if the evidence is representative of the total potentially available information. If it is not, or if it is not known, then the confidence level is low, regardless of the consistency. The analyst must be receptive to information that comes in from other sources regardless of whether it supports the hypothesis or not.

Persistence of Impressions Based on Discredited Evidence

Whenever the analyst receives evidence, there is a tendency to think of things that explain the evidence. These connections create impressions. Although the analyst discredits the evidence, the connection remains, and so do the impressions. An example is a clandestine source under hostile control. If the source has a record of passing accurate information, the analyst tends to judge all information that is passed according to previous accuracy. The analyst may doubt the validity of the report claiming that the source is under hostile control or may rationalize the inaccuracy in some other way. Either way, the evidence is based on previous information and not on current indicators. This is one way an enemy could launch a deception operation. This is important. An analyst who "reasons away" information contrary to pet hypotheses does the commander a disservice. Analysts must be professional and capable of saying, "I was wrong," before the situation is lost.

Availability

The ability to recall past events influences judgment concerning future events. Since memory is more readily available, and is more acceptable, it is easy to rely upon memory instead of seeking a proper sample to predict events.

Overcoming bias is a vital step to proper analysis. Any of the above biasas reduces the quality of analysis performed.

CHAPTER 6

SITUATION DEVELOPMENT

Situation development enables commanders to see and understand the battlefield in sufficient time and detail to make sound tactical decisions. It helps locate and identify enemy forces; determine their strength, capabilities, and significant activities; and predict their probable courses of action. Situation development helps the commander to effectively employ available combat resources where and when the decisive battles will be fought. Also, it helps prevent the commander from being surprised.

This chapter describes the analysis phase of situation development. It also describes how information is converted to intelligence to satisfy the commander's PIR. Analysis in support of situation development continues the IPB process and portrays significant aspects of the enemy, weather, and terrain in support of the decision-making process. This portrayal is baeed on the analysis of information from all sources that previously has been recorded, cataloged, and evaluated in a manner to facilitate effective analysis. This intelligence data base is continuously updated to ensure the information in it is current and accurate.

Automation increases the capability to manipulate large volumes of information from many sources and assist in the analysis process. However, analysis continues to be a human function. Information is interpreted by an analyst who adds the element of judgment, which is essential "to effective intelligence analysis.

History provides many examples of intelligence failures that are directly attributable to faulty analysis by people. In some cases, the indicators were present, but were either not recognized or were misinterpreted due to the analyst's preconceptions of the situation. In others, the analysis was correct, but was not presented in such a way that decision makers would accept it.

The primary product of intelligence analysis is the intelligence estimate. The estimate provides the best possible answer to the commander's PIR that is available at the time. The estimate is dynamic, constantly changing with the situation. Thus, analysis is conducted continuously with the information available. The available information almost always is incomplete. The analyst uses what is known about the enemy, weather, and terrain from the IPB to estimate what is not known. In addition, the analyst determines the enemy's capabilities, which are the basis for predicting probable courses of action.

ENEMY CAPABILITIES

Enemy capabilities are courses of action which the enemy can take to influence the accomplishment of the friendly mission. They indicate--

- What the enemy can do.

- When the enemy can do it.
- Where the enemy can do it.
- In what strength the enemy can do it.

The PIR normally are about enemy capabilities. Estimates of enemy capabilities and their probability of adoption impact significantly on the friendly commander's scheme of fire and maneuver for accomplishing the mission. By integrating the enemy's tactical doctrine, characteristics of the AO, and time and space factors as developed through IPB, the analyst estimates enemy capabilities with a reasonable degree of confidence. Enemy actions that would have little effect on friendly operations, would not benefit the enemy, or are not tactically feasible are not considered enemy capabilities. For example, an enemy force normally disengages its troops in an adjacent area to free these for commitment within our sector or zone. However, in some circumstances, this is not a viable enemy option. Therefore, in those circumstances this capability normally is not considered as an option.

Generally, there are four tactical courses of action open to the enemy in conventional operations: attack, defend, reinforce, or conduct a retrograde movement. These are divided into a variety of more specific courses of action. For example, an attack may be a penetration, an envelopment, or other variations of an attack. A retrograde movement may be a delaying action, a withdrawal, or a retirement.

Some enemy capabilities refer specifically to the support of combat forces rather than the capabilities of the combat forces themselves. Support capabilities include--

- Use of NBC weapons.
- EW.

Support capabilities always are considered, especially when enemy implementation of them will significantly affect the accomplishment of the friendly mission.

The analyst considers when the enemy can implement a capability. Time is a critical factor in the Air Land Battle; the friendly commander relies on time to defeat enemy first-echelon forces before follow-on echelon forces are committed to the battle. The friendly commander needs an accurate estimate of when enemy forces are employed to decide how to fight the battle. The analyst considers the following factors in estimating when an enemy force will be employed:

- Mobility capabilities.
- Disposition.
- Doctrinal rates of movement.

- Characteristics of the terrain, LOC, trafficability, and obstacles.

- Time required for displacement, assembly, emplacement, and closing on the battle area.

Integrating information on the enemy and the battlefield environment determines where the enemy implements a capability. The enemy composition, disposition, and weapons and equipment dictate how well the enemy moves, shoots, and communicates--the activities vital to most enemy courses of action. Analysis of existing and forecasted weather conditions and military aspects of the terrain reveals how they affect enemy capabilities in various parts of the AO. AAs and MCS determine where the enemy moves on the ground. LZS and DZS determine where the enemy employs airmobile, air assault, or airborne forces. Suitable beaches determine where the enemy launches an amphibious assault. The location of suitable assembly areas, firing positions, and targets determines where the enemy launches NBC weapons. Also, the location of suitable defensive positions determines where the enemy defends. Terrain factor overlays, which are developed during IPB, identify specified aspects of the terrain. They help the analyst determine where the enemy implements various capabilities.

The strength in which an enemy implements a capability depends primarily on the composition, disposition, and strength of available forces. Chapter 3 describes the 06 files which provide the necessary data for computation. Appendix D describes how to compute enemy strength.

The IPB data base is the key in determining enemy capabilities. Doctrinal and situation templates assist the analyst in estimating enemy capabilities. The avent template and EAM help the analyst determine when and where the enemy can implement a capability. Using the working SITMAP, the analyst continuously monitors the enemy situation. The analyst compares the working SITMAP with IPB templates and adjusts the capabilities accordingly. The analyst also follows the friendly operation to determine which enemy capabilities have the greatest effect on the friendly operation.

ENEMY COURSES OF ACTION

The ultimate objective of intelligence analysis is to answer the PIR with an acceptable degree of confidence. This normally involves a determination of the enemy's most likely courses of action and the probability the enemy adopts those courses of action. Like capabilities, the analyst determines the enemy's probable courses of action in terms of what, when, where, and in what strength. The probable courses of action provide the basis for predicting enemy intentions. By accurately estimating the enemy's intentions, the analyst provides the answers to critical uncertainties which impact on the commander's tactical decisions.

indicators are the basis for situation development. The analyst integrates information from all sources to confirm indicators of enemy

activities. As indicators are detected and confirmed, PIRs are answered. Appendix C lists common indicators.

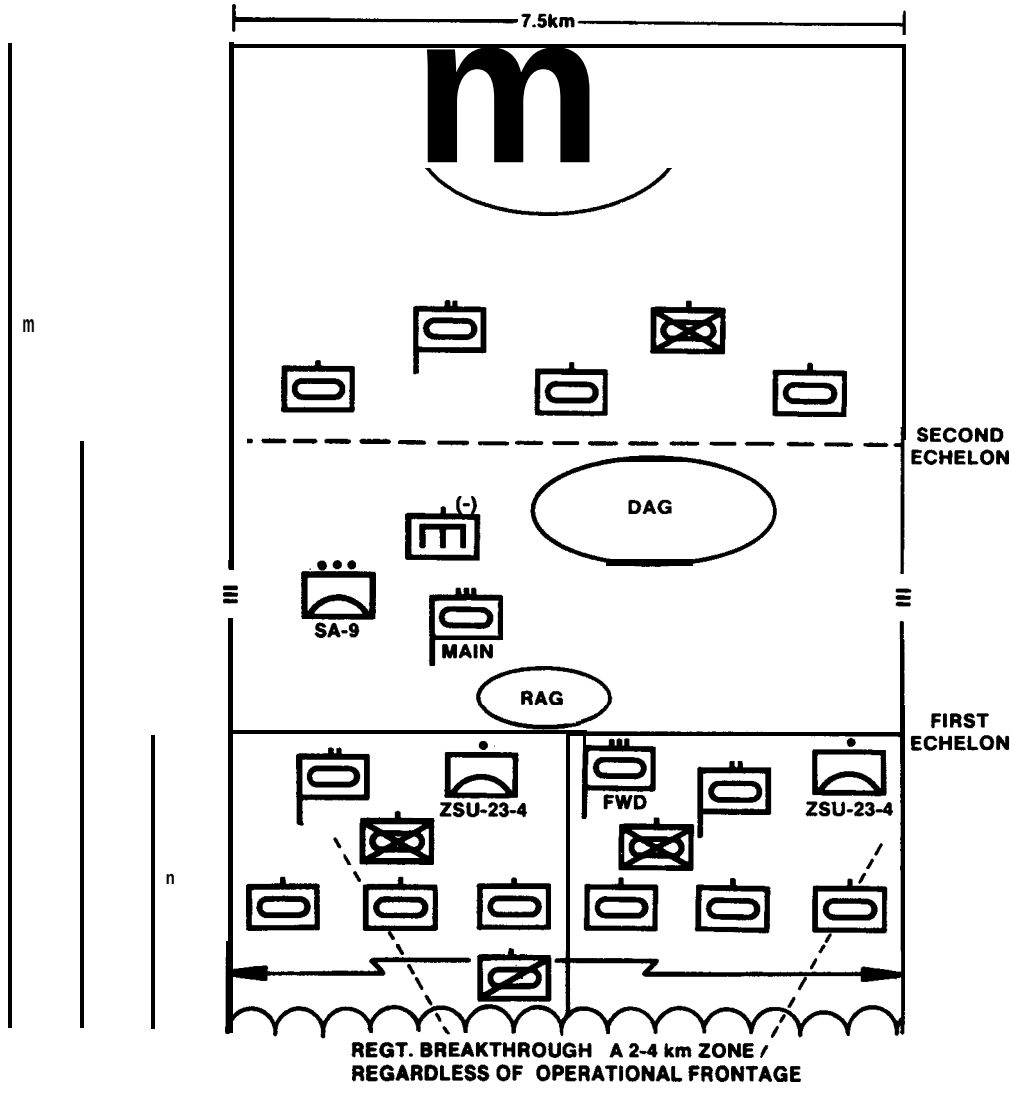
WORKING SITUATION MAP

The working SITMAP is the basic analytical tool at all levels. It provides a graphic presentation of the battlefield for the analyst, commander, and staff. The working SITMAP integrates significant information from all sources in a graphic representation that is easy to comprehend. All intelligence records are used with the working SITMAP to develop the enemy situation and intelligence estimate. The analyst posts all practical information to the working SITMAP. Such information may include strength, activity, or last known location. An "as of" time must always accompany map information. This allows outdated intelligence to be removed and assists in monitoring enemy progress. The analyst maintains separate records of information that cannot be posted and uses them to back up and expand the information on the working SITMAP. Other records normally are more permanent than the working SITMAP. The significant information about the enemy and the terrain becomes apparent when posted. The analyst uses the working SITMAP to--

- Identify critical relationships.
- Evaluate, compare, and integrate information and intelligence from all sources.
- Track enemy forces.
- Identify indicators.
- Wargame opposing courses of action.
- Identify uncertainties.

Critical relationships help to determine the composition of enemy units, assess their capabilities and probable courses of action, and identify exploitable weaknesses. The analyst identifies critical relationships by comparing separate items of information on the working SITMAP and by comparing the working SITMAP with other intelligence records.

By comparing known information about an enemy unit (posted on the working SITMAP) with the appropriate doctrinal template and the OB book, the analyst identifies unknown elements of an enemy unit. For example, if two motorized rifle battal ions (MRBs) of an MRR have been identified, located, and posted on the working SITMAP, the third MRB is most likely deployed nearby. The doctrinal template helps the analyst determine the most likely location of the third MRB. This comparison also helps the analyst identify and locate enemy HVTS I ike CPS and AD weapon sites. Figure 6-1 shows an example of a doctrinal template. Critical relationships become more apparent when the doctrinal templates are compared with known unit locations plotted on the working SITMAP. Further doctrinal templates of Soviet-style forces are available in GTA 30-1-24.



NOTE: For clarity, support units and observation posts are not depicted.

Figure 6-1. Doctrinal template tank regiment main attack (div slice).

The working SITMAP makes it easier to evaluate and compare information from different sources. The analyst compares incoming information with the information previously posted to the working SITMAP for compatibility with existing data. This comparison also helps to integrate new information with existing information and to determine its significance.

The working SITMAP provides a record of the latest location of enemy forces. As new information on enemy locations is received, the analyst compares it with information on the old location. This indicates the direction and rate of enemy movement. It also helps determine the accuracy of reports. For example, if the time a unit is observed in a new location (compared with the location and time the unit was last observed) indicates unusually rapid movement that significantly exceeds the doctrinal rates, the analyst is alerted to a problem. Either the old or the new report is inaccurate, or the two reports may not concern the same unit. It might alert the analyst to the possibility of an enemy deception operation. The analyst uses the IPB event template and EAM to project enemy movement. By comparing these with actual enemy movement as indicated on the working SITMAP, the analyst predicts the enemy's probable course of action and predicts when and where the enemy implements it.

The working SITMAP is vital in recognizing and evaluating indicators. Most indicators are associated with patterns of enemy activity, which become apparent on the working SITMAP. For example, an indicator of attack is the massing of artillery well forward. The working SITMAP reveals the location, density, and movement of enemy artillery. A careful analysis of the working SITMAP helps the analyst identify artillery groups, their composition, disposition, and location in relation to the FLOT. By comparing the working SITMAP with doctrinal and situation templates, the analyst better identifies significant patterns of enemy activity and associates them with specific indicators.

The working SITMAP is well-suited for wargaming opposing courses of action. Wargaming integrates friendly and enemy capabilities and possible courses of action with the weather and terrain. It helps both the operations and the intelligence staffs to analyze opposing courses of action. This is vital to preparing the estimate of the situation and the intelligence estimate. It also helps the analyst predict the enemy reaction to friendly courses of action.

The analyst uses the working SITMAP to clarify uncertainties. For example, if the analyst identifies two MRBs that are subordinate to a particular MRR, further knowledge of the enemy's organization tells the analyst that there is a third MRB that has not been located.

The IPB templates are important analytical tools when used with the working SITMAP. Comparison of templates and the working SITMAP systematizes analysis and increases the accuracy of the estimate. Situation and event templates depict projected enemy activities while the working SITMAP depicts the actual observed enemy activities. By comparing and integrating the two, the analyst predicts future enemy activities with greater accuracy.

FACTORS OF ANALYSIS

The analyst must understand the dynamics of the AirLand Battle to accurately analyze the forces that occupy it and the impact of the environment on those forces.

The analyst understands the enemy's tactical doctrine and the other forces that impact on the execution of that doctrine. The following suggestions are some techniques for developing enemy capabilities and the relative probability of their adoption. These techniques help the analyst use available information effectively to find the right answers to critical uncertainties.

The analyst considers the enemy's use of mass and economy of force. The enemy commander, like the friendly commander, has limited combat resources. The enemy commander uses mass and economy of force at the optimum times and places to accomplish the mission. Rather than dissipate the forces across the entire battlefield, the enemy commander weights the main effort to ensure combat superiority at the decisive time and place. Once the analyst determines how the enemy commander uses mass and economy of force on the battlefield, the enemy's most probable course of action becomes more apparent. The enemy uses follow-on echelons to mass combat power at decisive times and places on the battlefield. In the AirLand Battle, the analyst locates and tracks these enemy follow-on echelons and predicts where and when they will be committed. Situation and event templates used with the working SITMAP help the analyst predict where the enemy will mass.

On a nuclear battlefield, massing presents new opportunities and dangers. Nuclear weapons are substituted for massing of other forms of combat power, yet some concentration of enemy forces is required to successfully exploit strikes.

Analysts identify the composition of enemy force at least one echelon above their own. The mass and economy of force problem is resolved at each enemy echelon. The higher echelon commander's decision on a maneuver scheme and the allocation of combat power and support impacts directly on enemy capabilities within the analyst's unit's zone or sector.

Identifying the enemy composition facilitates construction of a composite picture of the total enemy force structure, including information on identified and unidentified units, located and unlocated units, total reinforcements, types and amounts of CS or CSS, and the availability of special capabilities (river crossing, EW, intelligence collection). In addition, detailed analysis of enemy composition assists in quantifying the degree of uncertainty that still exists. This judgment affects the degree of confidence an analyst has in estimating. Most intelligence judgments are inductive generalizations based on fragmentary evidence. By comparing available information with the composition and organization of the enemy force, the analyst determines what percentage of the total picture of the enemy force is known, and what percentage remains uncertain. For example, agencies report that four enemy artillery batteries have displaced forward. The analyst generalizes that enemy

artillery is displacing forward, an indicator of attack. However, if the composition of the enemy force indicates a total of 40 available batteries, the analyst must recognize that the judgment is based on only 10 percent of the picture. Ninety percent is still uncertain. It is vital that analysts be conscious of the degree of uncertainty remaining in the situation.

Analyze the significance of enemy activity outside your zone or sector . Consider the big picture when assessing the meaning and significance of enemy activity in your AO. Enemy boundaries are not identical to friendly boundaries. Events outside your boundaries may be part of the enemy commander's scheme of maneuver. Analysis of events outside a unit's AO provides indicators or helps focus the collection and analysis efforts within that unit's AO. Events that occur within a friendly unit's AO require correlation with events outside the AO if they are to be correctly interpreted. This is related to and facilitated by the determined composition of the opposing enemy force.

Review enemy tactical doctrine. Enemy commanders are trained to follow their own tactical doctrine. Though some enemy commanders are more or less innovative, most consciously or unconsciously apply doctrine when confronted with a specific mission, threat, and AO.

Enemy tactical doctrine presents many of the indicators of enemy capabilities and probable courses of action. It relates directly to how the enemy uses mass and economy of force in operations.

The enemy's tactical doctrine is depicted on doctrinal templates when possible. Doctrinal templates depict unit formations; frontages and depths for attack, defense, and other operations; characteristic dispositions associated with particular courses of action; allocations of CS and CSS; and information on specialized military operations like river crossings and air assault operations. Event templates depict the doctrinal sequence in which the enemy conducts operations. The IPB templates and the working SITMAP are the basis for comparing the enemy's tactical doctrine with actual events.

Consider how the weather and terrain affect enemy capabilities and the enemy commander's choice of a course of action. Weather and terrain are physical constraints which facilitate or alleviate the adoption of specific courses of action. These constraints have a major impact on how the enemy commander allocates resources. Weather and terrain force enemy commanders to apply special methods of operations. They may require changes in weapons and equipment or in the way they are used. The weather and terrain may give rise to new force structures and organizations.

Paragraph two of the intelligence estimate addresses the effects of the weather and terrain on friendly and enemy operations (see Appendix A). Through continuous IPB and analysis, the analyst relates the enemy force structure and tactical doctrine to the constraints imposed by the weather and terrain, particularly on the AAs.

To relate enemy dispositions and physical constraints of the weather and terrain, there are four specific techniques used to determine how the enemy appl ies mass and economy of force.

The first technique is to determine the enemy unit boundaries and relate them to AAs. Boundaries frequently are identified through the location of enemy reconnaissance and cavalry units (which often have distinctive, easily identified equipment), terrain and doctrinal analysis of enemy prisoner of war (EPW) capture locations, and other techniques. This technique helps determine mass and economy of force and the enemy commander's perceptions of AAs.

The second technique is to compute enemy strength in terms of committed forces, reinforcements, and supporting weapons for the entire AO, then recompute for each AA. Determine whether enemy combat power and support are distributed evenly or whether one option is weighted. Appendix D describes how to compute enemy strength.

The third technique is to analyze enemy allocations of available LOC. Military forces usually allocate roads to tactical units for logistical support and tactical movement. If this allocation is determined through analysis of enemy boundaries and traffic patterns, it indicates the enemy's probable course of action and assists in identifying enemy support priorities.

The final technique is to identify potential enemy objectives and relate them to enemy dispositions and AAs. Determine which avenue is weighted by locating unit boundaries, computing unit strength, identifying allocation of LOC, and identifying the distribution of combat power.

TECHNIQUES OF ANALYSIS

The following techn iques of analysis helps the anal yst identify the presence of indicators.

PATTERN ANALYSIS

Pattern analysis helps the analyst identify indicators of enemy activity. Pattern analysis is based on the premise that the enemy's course of action results in certain characteristic patterns that are identified and correctly interpreted. Ideally, paragraph 3d of the intelligence estimate (Appendix A) should identify the presence of these indicators. The analyst is faced with the problem of organizing and recording incoming information and adding it to existing information so that meaningful relationships are clarified. The working SITMAP and IPB templates are the primary tools used to organize information. Indicators can be ambiguous and incomplete. The analyst identifies the patterns of activity or tip-offs which characterize the operations of specific enemy units.

WEIGHTING INDICATORS

Weighting indicators helps resolve ambiguity. In combat, intelligence analysts usually are confronted with conflicting indicators. Enemy forces may portray patterns associated with attack, defense, and delay simultaneously. Conflicting indicators result from--

- Deliberate deception.
- Bad execution.
- Temporary indecision.
- Transition between missions.
- Random activity.
- Incomplete or inaccurate information.
- Ambiguity of the indicator itself.

When confronted with ambiguous or conflicting indicators, analysts weigh some indicators more heavily than others to determine the enemy's actual intent. This is not a problem of simple mathematics. The enemy's actual course of action may not have the most indicators. Analysts develop a methodology for identifying those indicators which are most highly characteristic of a course of action. There are several techniques which, individually or in combination, assist in this process.

Origin of the Indicator

One technique of determining the enemy's intent is to consider the origin of the indicator; that is, the reason why the enemy force presents a particular pattern or tip-off. In brief, all indicators stem from either military logic, doctrinal training, organizational constraints, bureaucratic constraints, or the personality of the enemy commander.

Military Logic. Military logic implies, and military experts agree, that solutions to many military problems are obvious. For example, all modern armies employ artillery forward for attack and echeloned in-depth for defense. Violation of military logic usually implies the loss of combat power or support at some critical point during an operation.

Doctrinal Training. A nation's tactical doctrine includes military logic and much more. Most doctrine begins where military logic ends. Military experts sometimes disagree on the ideal solution to a specific military problem. For example, US and Soviet doctrine agree on deploying artillery forward in the attack, while they disagree on using artillery in a direct fire role. Just as terrain and weather are physical constraints on the enemy's adoption of a course of action, enemy doctrine and training are mental constraints. Soviet emphasis on detailed, repetitive training is designed to inbreed a sort of reflex action which enhances the value of doctrinal indicators. Though individual commanders display more or less

imagination and creativity in its application, indicators based on doctrine and training are generally reliable.

Organizational Constraints. Organizational structure represents a special case of doctrine. The ideal composition of a division (size, organization, weapons, and organic support) is debatable. The military experts have resolved this issue in radically different ways. Organization influences include a nation's strategic commitments, economic resources, geography, threat perceptions, historical experience, alliances, personnel and equipment resources, and a myriad of other factors. The tactical organization resulting from these factors causes identifiable patterns to develop when employed. A US division generally has three subordinate maneuver headquarters contrasted with four in a Soviet division, and differences in the composition and structure of the division base imposes distinct patterns concerning US and Soviet operations.

Bureaucratic Constraints. Identifying bureaucratic constraints as a source of indicators shows that military units are large organizations and must establish routines and SOPS to function efficiently. This imposes patterns in planning, execution, logistics support, and other activities, though there are general similarities in routines and procedures of comparable units, there are likely to be significant variations which can be identified and exploited locally.

Personality of the Commander. The enemy commander is the final source of indicators. Each commander has a unique history of personal training, experience, success, failure, and idiosyncrasies. Many are creatures of habit, prone to repeat what has worked in the past; others are creative and innovative. All are captives of their experience to some degree. It is the commander who must apply. and mix military logic, doctrine, and organization to accomplish the mission. The commander's personality is one major source of deviation from established doctrinal norms, The importance of personality is recognized in that biographic intelligence is a major component of strategic intelligence. US tactical OB doctrine classifies personality as a subcategory under miscellaneous factors.

In general, indicators are weighed, with the role of the commander being considered a variable. In the case of a strong, innovative, or eccentric commander (Patton or Rommel), personality is more important than doctrine or training; while the personality of a methodical, traditional commander ranks last.

Principle of Mass Indicators

Another technique is to weigh the indicators which reflect or are based on the principle of mass. Military units normally conduct deception operations with the same force constraints in which they accomplish their actual mission. The enemy commander often conducts deception with the least outlay of scarce resources. Indicators based on a major confirmed commitment of combat resources are more likely to reflect the true situation. In a nuclear environment, massing is not required to achieve a favorable combat power ratio; thus, mass is not a reliable indicator.

Analysts identify the enemy's capability to concentrate fires of potential nuclear del ivery systems.

Other Indicators

The last technique is to weight those indicators which are most difficult to fake.

Quantify Probable Relationship. Quantify the probable relationship between the presence of specific indicators and the enemy's adoption of a particular course of action. If the enemy commander intends to adopt a particular course of action, what is the probability that a specific indicator is present? The answer is subjective, but it is based on the analyst's knowledge of and experience with the enemy, the analyst's professional judgment, and to some degree, the mathematical probability of specific indicators associated with enemy courses of action.

Analyze the Time Sequence of Events. It takes time for an enemy force to prepare, move, and execute an operation. Time, mass, and space relationships are a major tool in exposing deception. Since deception is often conducted with the least outlay of combat resources, close analysis of information from different sources which report on the same location, at the same time, or concerning the same enemy unit may reveal significant discrepancies.

Assess the Enemy's Combat Effectiveness. Such assessments are based on an analysis of both tangible and intangible factors. Tangible factors include personnel and equipment strength. Intangible factors include morale, training, political reliability, and other factors. While combat effectiveness bears directly on a unit's capabilities and probable courses of action, there is no scientific method of determining it. It requires the analyst's subjective judgment of the impact of both the tangible and intangible factors.

WARGAMING FRIENDLY AND ENEMY CAPABILITIES

Consider the enemy G2's perception of the friendly force. Though enemy capabilities exist independently of their assessment of friendly forces, the enemy's choice of alternative courses of action does not. Determine the enemy's perception of friendly capabilities through analysis of the collection capabilities, known collection activities, and inadvertent disclosures by friendly forces which might have been monitored by enemy intelligence. Detailed analysis of potential disclosure enables the analyst to partially reconstruct the enemy G2's working SITMAP.

Mentally wargame advantages and disadvantages of identified enemy capabilities from the enemy commander's point of view. This is a valuable analytical technique, but potentially dangerous if it becomes mirror-imaging.

Avoid preconcert ions. The analyst must remember that the objective is not to prove a prior judgment. Experience suggests that preconceptions are the analyst's pr incipal nemesis. Even if the techniques recontnended

above are creatively employed, there is a danger that the analyst who has reached and expressed a preliminary judgment unconsciously begins to seek and weigh evidence which confirms the initial estimate and dismisses or passes over inconsistent or conflicting information. The analyst should not be concerned about the answer, as long as it is the right answer. The analyst reserves judgment, maintains objectivity, remains aware of uncertainties, tolerates dissent, and constantly tests working theory against available evidence. Where practical, the analyst considers establishing a "devil's advocate" system to test, challenge, and think the unthinkable.

CHAPTER 7

TARGET DEVELOPMENT

Targeting is the process of selecting targets and matching the appropriate response to them taking into account operational requirements and capabilities. An efficient, organized targeting effort is critical to the success of AirLand Battle operations. A target is a geographical area, complex, or installation planned for capture or destruction by military forces. Attacking HPTs that are least affordable to lose, strips the enemy of the initiative and forces the enemy to conform to friendly battle plans.

Targeting has always been a complex effort. Large numbars of sensors under the control of different agencies are closely coordinated to be efficient and must rapidly report fleeting or dangerous targets. The wide variety of attack means and munitions are compared to the particular vulnerabilities of many different types of targets. Targeting is a multidisciplined effort, requiring interaction between FS, intelligence, EW, operations, and plans cells.

The object of targeting is to disrupt, delay, or limit those enemy capabilities which could interfere with the achievement of friendly objectives. Do not confuse disrupt, delay, and limit with suppress, neutralize, and destroy. The latter relate to the amount of damage inflicted upon a target. Disrupt, delay, and limit apply to the effect that the damage has upon the target as it pursues a course of action. A further clarification of disrupt, delay, and limit is available in Annex A to FM 6-20-10. The staff recommends how a target is engaged.

Targeting is based on the friendly scheme of maneuver and tactical plans. It includes an assessment of the weather, terrain, and enemy to identify those enemy formations, equipment, facilities, and terrain which are attacked or controlled to ensure success. Targeting is an integral part of the planning process which begins with the receipt of a mission and continues through the development of the approved plan. The targeting process includes the development of a prioritized list specifying what targets are to be attacked, and what is required to defeat the target. Figure 7-1 shows the staff functions during the targeting process.

This process supports the commander's decision on which broad attack option to use to engage the targets: maneuver, EW, FS, or a combination thereof; and the determination of the echelons that engage the target. An assessment of the attack is then conducted to determine the effectiveness of the targeting process. Although the targeting process is more cornnonly associated with high and medium intensity conflicts, it also applies to LIC. While spread sheets and target sheets currently do not exist for LIC, the concept of key personnel meeting together to determine the most important targets to strike in support of the friendly maneuver commander HVTS and to detect and attack those targets still applies. The targeting methodology is characterized by three functions: decide, detect, and deliver. These three functions are inherently intertwined. Figure 7-2 shows the three functions of the targeting process.

Receive guidance on:

Commander's intent.
HPT.
Attack criteria.
Lead time between decision points and TAIs.

Develop:

Future MCOO.
Situation and event templates.

Explain enemy courses of action as part of wargaming. Based on friendly courses of action, refine event template. Assist in development of HPT matrix and target selection standards.

Based on commander's approval or changes of CoA, HPT, attack guidance:

Publish collection plans and SORs.
Brief ASPS, CM&D, TCAE, as appropriate on CoA, HPT, TSS, attack guidance.
Ensure all analysts and collectors understand commander's intent.

Collect information.
Pass HPT related information and intelligence immediately to FS.
Pass other intelligence and target damage assessments per SOP.
Ensure information collection and intelligence production supports any FRAGOs.

Figure 7-1. The targeting process checklist.

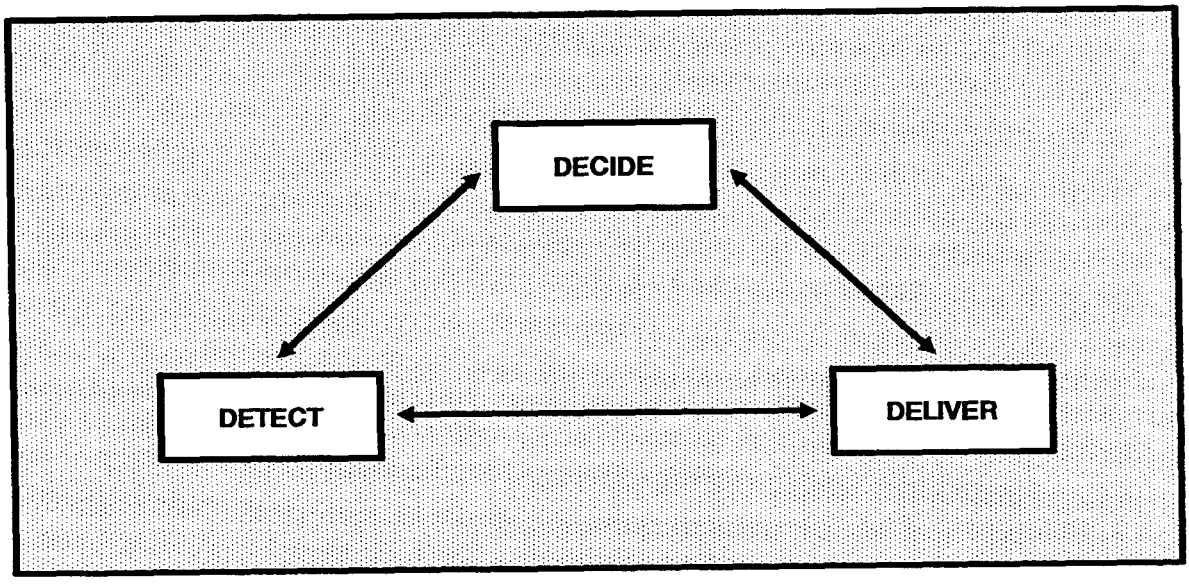


Figure 7-2. Targeting process.

The DECIDE function is the planning associated with a successful targeting effort. It requires close interaction between the commander, intelligence and operating staffs, FS personnel, and various other CS agencies. The staffs must have a clear understanding of the unit's mission, the commander's concept of the operation and intent, and the commander's initial planning guidance with respect to target priorities. With this information, the staff officers prepare their respective estimates. From the standpoint of targeting, the FS, intelligence, and maneuver estimates are interrelated and require close coordination between the respective elements. The DECIDE function provides a clear picture of the targeting priorities applicable to the tasking of TA assets, information processing, the selection of an attack means, and the requirement for post attack assessment. Specifically, the DECIDE function is designed to answer the questions:

- What is it we need to look for?
- Where and when can it be found?
- Who can locate and identify it?
- Which attack option should be used?
- Will target damage assessment (TDA) be required or possible?

In the DETECT function, the priorities developed in the DECIDE function are translated into the TA taskings found in the subordinate unit's portion of the OPORD and in intelligence and FS annexes. All TA assets available to the commander are fully utilized. As the TA assets gather information, they report their findings back to their controlling headquarters which in turn pass pertinent information to the tasking

agency. The information gathered is processed to produce valid targets. Not all the information reported benefits the targeting effort, but it may be valuable to the development of the overall situation. The target priorities developed in the DECIDE function help to expedite the processing of targets. As these targets are developed, appropriate attack systems are tasked in accordance with the commander's guidance and requirements of the attack system managers.

The DELIVER function is the execution portion of the targeting process. It consists of the selection of the appropriate attack means for a given target, the tasking of that attack system, and the execution of the attack by the specified means. If TDA reveals that the commander's guidance has not been met, then the entire targeting process continues focusing on this target.

The targeting effort is continuous. The intelligence, operations, and FS officers comprise the core of the effort at all echelons. Other staff officers that are involved with planning and controlling of firepower and TA also participate. The other staff officers that assist in the process include representatives of the Air Force (AF), the staff weather officer (SWO), the aviation officer, the chemical officer, the Army airspace control officer, the EW staff officers, and the engineer.

The rest of this chapter describes, in detail, the functions required to plan and engage targets successfully using the DECIDE-DETECT-DELIVER methodology.

DECIDE

Decisions are critical to the targeting process. They create the guidelines for the acquisition and engagement of targets. Establishing these guidelines at the beginning of the DECIDE function allows for a unity of effort and efficiency that would otherwise not be achieved.

The decisions that are made are reflected in visual products. The decisions made are what targets should be acquired and attacked, where and when will the targets likely be found and who can locate them, how the targets should be attacked, and is TDA required. The products are the HPT matrix (what targets should be acquired and attacked), target selection standards (TSS) (what assets can produce targets), the collection plan (where and when should targets be found and who can find them), and the attack guidance matrix (how targets should be attacked). The collection plan is a G2 or S2 product that is important to the targeting process but is not discussed in detail in this chapter. See FM 34-2 for discussion of collection plans.

The commander and staff plan for future operations by projecting one or more alternative courses of action based upon a mission analysis, the current and projected battle situation, and anticipated opportunities. IPB is an important process that assists the commander and staff in developing courses of action.

The process begins with the receipt of a mission, which higher headquarters assigns or the commander deduces. The mission statement directs the focus toward a course of action, in a particular area, against a specific enemy. The commander then, either with or without input from the staff, performs mission analysis. This analysis considers tasks that are performed, the purpose behind the tasks, and the constraints on the unit, resulting in a restated mission.

The restated mission provides the basis from which to start the staff estimate process. The intelligence estimate provides key support to target development. Target development is one of the four IEW tasks: situation development, target development, EW, and CI.

IPB AND TARGET DEVELOPMENT

IPB provides most of the information for the intelligence estimate which impacts on the target development process. IPB is a continuous, systematic approach to analyzing the enemy, weather, and terrain in a specific geographical area. This approach evaluates enemy capabilities and predicts enemy courses of action with respect to specific battlefield conditions.

It is important for the analyst to understand the effects of battlefield conditions, especially obscurants, on targeting. Such conditions drive the need for remote sensors and redundant systems to ensure proper coverage. The analyst must "see" the battlefield as it is, and not just as it appears on a map.

The initial IPB effort produces doctrinal templates which convert enemy OB into graphics and aids in the initial identification of potential HVTS. HVTS are those assets that the enemy commander feels are critical to the successful accomplishment of the mission.

Situation templates assist the refinement of HVTS for specific battlefield and courses of action. Concurrent with situation template development is an examination of enemy decision and logic trees associated with each potential course of action. This identifies likely "fail paths" that provide indications of what might happen if the enemy commander's plan fails and what actions comprise the enemy commander's failure options. The "fail path" evaluation leads to an identification of critical enemy functions associated with each enamy course of action and general HVTS associated with each function. Through BAE, terrain evaluation, and weather analysis, the enemy course of action is associated with a specific battlefield. Situation, event, and decision support templates are developed to identify critical enemy activities and any NAIs where specific enemy activities or events or lack therefore wil 1 help to confirm or deny the enemy's adoption of a particular course of action. Additionally, DPs or decision phase lines, TAIs, and HPTs are identified. HPTs are those HVTS that are acquired and successfully attacked to ensure the success of the friendly commander's mission.

TARGET VALUE ANALYSIS

IPB analysis considers terrain, weather, enemy doctrine, and current enemy actions to arrive at conclusions of what the enemy will do; the courses of action. Target value analysis (TVA) is a methodology which identifies potential HVT sets within a given tactical situation. If successfully countered, they provide a tactical opportunity. This methodology provides a relative ranking of worth of target sets. TVA begins when the analyst adopts the place of the enemy commander. The analyst, in coordination with the G3 or S3, FSO, and other staff members, wargames the operation. The purpose of wargaming is to finalize individual staff estimates and to develop a friendly and enemy DST. A by-product of this is the determination of the enemy assets that are critical to the success of the enemy mission--HVTS. Target spread sheets and target sheets are tools used in identifying HVTS. The information found on these documents is produced during the IPB and wargaming process. More information on the development and use of these targeting tools is available in Annex A of FM 6-20-10.

HVTS and HPTs

An HVT is a target whose loss to the enemy can be expected to contribute to substantial degradation of an important battlefield function. HPTs are HVTs which, if successfully attacked, contribute substantially to the success of friendly plans. The G2 or S2 section, together with the FSO and other staff, nominate HVTS to be HPTs. The key to HPTs is that they are based on the friendly concept of the operation and support the friendly force commander's scheme of maneuver. The development of HPTs from HVTS is done during the wargaming process. As the different options are fought by the staff, the G2 or S2 identifies specific HVTS. The staff discusses or wargames different courses of action to develop the HPTs. The HPTs for a specific phase of a battle are recorded on the DST as are the means decided on to deliver the attack. HVTS include enemy C^2 points, air defense artillery (ADA) assets, and engineering equipment. If friendly forces were planning an air attack the enemy C^2 and ADA might be HPTs, while engineers probably would not. Discussion on templating and IPB is available in Chapter 4 and FM 34-130.

The process of designating an HVT as an HPT requires careful staff coordination. The G2 and collection manager evaluate HVTs at different points in the battle to determine if collection assets are capable of detecting them and providing the necessary target resolution, for example, time, location, and so forth, to permit effective action (DELIVER). HPTs, because of their importance, receive priority in the allocation of detection systems. This priority is weighed against the same systems for situation development.

The FSO uses target sheets and the knowledge of friendly weapons systems to determine if there exists a capability to attack the HVT with lethal assets. The EW officer and others assist the FSO with regard to non-lethal systems. Availability of a weapon system should not affect the attack since HPTs have precedence over other targets. Using the capabilities of the systems to attack the targets, the G2 or S2 analyzes

and predicts the enemy's response to each. This analysis determines if the attack of the HVT is necessary to ensure the success of friendly operations. The commander uses it in developing attack guidance. The HVTs that meet the criteria of being acquirable, attachable, and capable of ensuring friendly success are designated HPTs. In most instances, the analyst chooses to target enemy elements that have been designated "critical nodes."' A critical node is an element, position, or corrrnunications entity whose disruption or destruction immediately degrades the ability of a force to command, control, or effectively conduct combat operations. HPTs are formatted for easy reference in an HPT matrix. The G3 or FSO prepares this matrix and gives it to the commander for approval . The selection of HPTs, which also are critical nodes, are facilitated by a number of already existing enemy studies. Selection of these critical nodes, coupled with other TVA efforts, al lows friendly forces to best determine those enemy elements which are HVTS or HPTs.

TARGET SELECTION STANDARDS

TSS are criteria by which personnel determine which systems produce valid targets, and which require some form of confirmation before their targets are considered for attack. The development of TSS is a joint function of the G2 and G3 sections and requires that the capabilities and limitations of collection assets be known. The CM section of the G2 provides the majority of these capabilities and limitations.

TSS do not determine that the information that the sensor receives is, in fact, a target. The analyst determines that. TSS reflect the system's capabilities to produce targets. TSS are dynamic. The effects of weather and terrain on both the Collection assets and enemy equipment are taken into account. TSS are keyed to the tactical situation. Great care is taken to deal with potential enemy deception, and to ensure the reliability of the source or agency that is reporting. TSS are designed to allow targeting personnel in the TOC to readily distinguish between targets and suspect reports. TSS are developed for all TA systems available.

Target location errors (TLEs) are the accuracies to which the assets can locate various targets. The source's TLE and the timeliness of information are considered. It is an inherent responsibility for the FSE to decide which systems have acceptable TLEs for targeting purposes in a specific tactical situation.

ATTACK OPTIONS

Knowing target vulnerabil ities and the effect an attack on them has on an enemy operation al lows a staff to propose the most efficient available attack option. A primary decision here is whether to disrupt, delay, or limit the enemy.

The opportunity to disrupt, delay, or limit is annotated next to the target sets on the target spread sheet. It is emphasized that these are guidelines and each target is attacked based on its own merits.

Once the staff decides whether a target is best disrupted, delayed, or limited, they select attack options. Utilizing the situation template and MCOO, the risk to an asset versus its effectiveness is assessed. The decision on what attack option to use is made at the same time as the decision when to acquire and attack the target. Coordination is required when an attack with two different means, for example, EW and CAS, is decided upon. These decisions are recorded on the DST and are made during the wargaming process. This requires that the proper coordination be performed in a timely manner.

ATTACK GUIDANCE

The commander approves the attack guidance, as recommended by the staff. This guidance details the specific HPTs to attack, when and how they should be attacked, and any attack restrictions, The staff developed and defined all this information during wargaming. Figure 7-3, the attack guidance matrix, shows a format that this information is put in. The matrix consists of a column for target categories, specific HPTs, how targets should be attacked, when they should be attacked, any restrictions. For a detailed explanation on using the attack guidance matrix, refer to FM 6-20-10.

DETECT

DETECT is the next critical function in the targeting process. This function is perhaps the most important area for future planning. The G2 or S2 is the principal figure in directing the CM effort to detect the targets identified in the DECIDE phase. The G2 or S2 works closely with the FAIOs and FSOS to determine requirements for accuracy, identification, and timeliness for collection systems. The intelligence section is responsible for ensuring that the collection system asset managers understand these requirements.

TARGET DETECTION MEANS

The detection of targets is accomplished using all available assets. Key to the detect function is a focus on the HPTs designated during the DECIDE phase of the targeting process. This is accomplished by the CM section of the G2. Every targeting asset is aware of what the commander designates as HPTs.

Field Artillery Target Acquisition Means

Several detection assets are presently organic to the FA at both corps and division.

Field Artillery Battalions. FA battalions in DS of maneuver brigades provide each maneuver battalion headquarters with a FSE to help plan, direct, and coordinate FS operations. The FSE provides fire support teams (FIST) to each of the maneuver battalion companies. Forward observers (FOs) from each FIST are deployed at both company and platoon levels and may accompany reconnaissance patrols or help to man observation posts

CAT		HPT	WHEN	HOW	RESTRICTIONS
(C3)	1	46, 48	I	N EW	COORD ATK WITH EW
(FS)	2	1, 2, 7	A	N	DNE MRL OLDER THAN 10 MIN.
(ADA)	3	58	P	SIG 2	SEAD PROGRAM 120800A
(ENGR)	4		P	N	COUNTERMOBILITY PROGRAM %
(RSTA)	5	85	P	EW	
(REC)	6	103, 105	P	N	
(POL)	7		A	D	ACCY 0-200 M PER TDA REQ
(AMMO)	8		A	D	
(MAINT)	9		P	25%	NOT HIGH VALUE OR PAYOFF
(LIFT)	10		P	N	NOT HIGH VALUE OR PAYOFF
(LOC)	11		P	N G3	NOT HIGH VALUE OR PAYOFF

CAT	=	Target Category (from TVA)
HPT	=	Designated high payoff target; these targets have priority for engagement. Target numbers from TVA target sheets
How	=	How target is attacked
	—S:	Suppress
	—N:	Neutralize
	—D:	Destroy
	—EW:	Jamming or other offensive EW means
	—X%:	Specified percentage of casualties or damage
	—G2:	Coordinate attack with G2 (any other person or element could be indicated)
When	=	When the target should be attacked
	—I:	Immediately. Interrupt other nonimmediate attacks if necessary
	—A:	As acquired. Attack as assets are available
	—P:	Plan. Include target in a program of fires or file for later attack when the situation changes
Restrictions	=	Any constraint on the attack of targets. Such constraints could be accuracy, time since acquisition, required coordination, or munition restrictions by amount or type. Other notes such as "TDA requires" or "Missile target only" could be included.
	DNE:	Do not engage
	—	Other abbreviations could be used as required by unit mission or SOP.

Figure 7-3. Sample attack guidance matrix.

(OPs). They are the grass roots of the FA's TA effort. They observe the battlefield to detect, identify, locate, and laser designate targets for suppression, neutralization, or destruction. They report both target ing data and combat in formation to the maneuver battalion FSO and S2 using either organic or supporting communications means. The capability of the F1ST to provide real time combat information cannot be emphasized enough. The battalion FSO receives in formation from and passes information to the FIST. The FSO continually exchanges targeting data and combat information with the brigade FSO and elements from the DS FA battalion. The FSO coordinates with the battalion S2 and S3 to identify and verify targeting data and combat information derived from the overall collection effort. The FSO is both a producer and a consumer of combat information.

Radar Assets. FA TA assets are the principle means for locating active indirect fire weapons.

Moving target-locating radar (MTLR) detects, locates, and identifies wheeled vehicles (light or heavy), tracked vehicles, and dismounted personnel . MTLR is used for surveillance of critical areas such as AAs. Mortar locating radar detects and locates enemy mortars and artillery quickly and accurately enough for immediate engagement.

The DS FA battalion S2 has staff supervision responsibility for the radar. This officer coordinates with the division artillery (DIVARTY) targeting officer, the DS FA battalion S3, and the FSO at the maneuver brigade to ensure that both FS and maneuver coverage requirements are met. Cueing instructions are required. MI sources provide specific guidance to orient radar assets before the enemy fires.

Combat Observation Laser Teams (COLTS). COLTS organic to each heavy and light division provide a TA capability previously not available on the battlefield. They are equipped to direct the engagement of targets.

Aerial Fire Support Officers. Aerial FSOS and TA aircraft are organic to the division and the corps. These assets are highly mobile and cover a much larger area than ground observers. As such, they are particularly good target detection assets. Targeting data and combat information are reported to the FSO at the maneuver brigade or battalion, the DIVARTY TOC, or the fire direction center of the DS artillery battalion.

Air Defense Artillery TA Assets

The forward area alerting radar (FAAR) of the AD units provides a deep look capability that can detect the location and movement of enemy air assets. The integration of corps and theater AD efforts enable friendly forces to obtain an air picture that can potentially cover the entire area of interest for the echelon in question. Future concepts allow input directly from theater AD assets into division air situation updates. Collation of this AD information with other combat information enables us to locate major enemy air assets, airfields, and refuel ing and rearming points. Many of these become HPTs in support of the friendly scheme of maneuver.

DETECTION PROCEDURES

The collection of combat information is integral to the entire DETECT process. It is essential that all TA assets be used in the most effective and efficient manner possible. Avoid duplication of effort among the various assets unless such duplication is desired to confirm the location or nature of a target. At corps and division, the CM&D section develops and actively manages the collection plan to avoid such duplication. At the same time, the CM&D section ensures that no gaps in planning collection exist. This allows timely combat information to be collected to answer the commander's intelligence and TA requirements. This combat information enables analysts to develop the enemy situation as well as conduct target development.

To detect the desired HPTs in a timely, accurate manner, clear and concise taskings are given to those TA systems capable of detecting a given target. The FS personnel provide the G2 or S2 with the degree of accuracy that the targets must be located with to be eligible for attack. The G2 or S2 matches accuracy requirements to the TLEs of the collection systems. This matching allows the G2 or S2 to develop a more detailed set of TSS based not only on the acquisition system but also upon the HPTs' acceptable TLEs that the G2 or S2 gives. These acceptable TLEs cannot be placed in an SOP as they depend on the situation. Collection efforts focus on those NAI and TAI that the IPB process identifies during the DECIDE phase. Knowledge of the target type and its associated signatures (electronic, visual, thermal) enable friendly forces to direct the most capable collection asset to be tasked for collection against a given target. The asset is positioned in the most advantageous location based on friendly estimates of when and where the enemy target is located.

The decision to limit, disrupt, or delay a given HPT results in a requirement to detect that target. Information needs, to support the detection of the target, are expressed as PIR and IR. Their relative priority is dependent on the importance of the target to the friendly scheme of maneuver coupled with the commander's intent. The PIR and IR that support detection of a target are incorporated into the unit's overall collection plan. The collection manager translates the PIR and IR into SIRS. The collection manager considers the availability and capabilities of all collection assets within their echelon as well as those assets available to subordinate, higher, and adjacent units (to include joint or combined force assets).

As various assets collect the combat information to support target development, this information is forwarded through the IEW system to the intelligence analyst at the G2 or S2 staff. The analyst uses this combat information to perform both situation and target development. When the analyst detects a target, the target is passed immediately to the FS element to determine if the target is an HPT, its priority, and if it meets the TSS. Close coordination among the intelligence staff and the FSCOORD is essential to ensure that these targets are passed to an attack system which engages the target. To ensure that this occurs in a timely manner the FAIO must have access to the ASPS. One technique is for the FAIO to be physically located in the ASPS or CM&D. Procedures are estabI ished for cueing the FAIO as the predesignated HPTs are identified. ASPS personnel are aware of HPT. When an HPT is discovered it is passed without delay to FSE personnel . Usually, a member of the ASPS hand-carries the intelligence. This allows for consultation at a map and for intelligence to be placed into context with the overall situation. The FAIOs coordinate with their respective G2s and FSES to paes the targets directly to the fire control element at the DIVARTY TOC or, if the commander approves, directly to a firing unit. This results in the most efficient and timely engagement of those targets which the FS has designated in advance for engagement.

The passing of targets and suspect targets to the staff is accomplished by a number of means. It is important that essential. Information that is passed for proper analysis and attack takes place. As a minimum, the target report includes:

- Date-time group (DTG) of acquisition by the sensor.
- Description of the target.
- Size of the target.
- Target location.
- TLE.

The specific forms and formats for passing target information are specified in the unit SOP.

The DTG is important as the target's perishability or vulnerability window is analyzed. This impacts on the urgency of the attack or the denial of attack based upon the likelihood of the target having moved.

The target description and target size are required to determine attack means, intensity of attack, number of assets to be corrrnitted, plus other technical considerations. They are used to compare with the attack guidance matrix. The target's location is given as accurately as possible within the confines of timeliness.

DELIVER

The DELIVER portion of the targeting process executes the target attack guidance and supports the commander's battle plan once the HPTs have been located and identified. This portion of the process has two key elements--the attack of targets and the TDA of those targets.

ATTACK OF THE TARGETS

The attack of the targets satisfies the attack guidance that was developed in the DECIDE portion of the targeting process. The attack of targets requires a number of decisions and actions. The decisions are described as a set of tactical and technical decisions. Determining the time for the attack, the attack system, and the required effects on the target are the tactical decisions to make. Based upon these tactical decisions, the technical decisions describe the precise attack means, the unit to conduct the attack, the time of the attack, and in the case of FS assets, the number and type of munition. The actions in the attack of the targets are the actual physical attack of the targets by lethal or non-lethal means. The time of attack of the target is planned or by opportunity.

Planned Targets

Planned targets are evaluated initially to determine if the DF has been reached or a trigger event has occurred. If either of these has

occurred and the resources that were identified to be used against the target are available, the target is attacked. If the decision is to attack now, a check is made to determine if the attack system, that we earlier allocated for the attack of that target, is available. If so, the attack is conducted with that system. If the allocated attack system is not available, a decision is made on which other attack asset to use. If the decision is made to defer the attack, the staff identifies the new DP to the intelligence or acquisition system.

Targets of Opportunity

Targets of opportunity are evaluated initially as to when they should be attacked. This decision is based on a number of factors such as the activity of the target, how long the target can be expected to stay in its current location (target perishability) and the target's payoff, relative to the payoff of the other targets currently being processed for engagement. If the decision is made to attack now, the target is processed further. If required, additional information is requested from the intelligence or acquisition systems. If the decision is made to defer the attack, then a DP is determined and described to intelligence or acquisitions systems. Additionally, an assessment of the availability and capabilities of attack systems to engage the target is made. If the target exceeds either availability or capability of the unit's attack systems, then the target should be nominated to a higher headquarters for attack.

DESIRED EFFECTS

The desired effects on the target are determined. As mentioned earlier, we either delay, disrupt, or limit the target, based either on time or terrain, This determination was made earlier in the case of planned targets. For targets of opportunity, the staff makes the determination. This decision is made based on the payoff of the target and the constraints on availability of attack systems and munitions. The determination of the desired effects is required before selecting an attack system.

TARGET DAMAGE ASSESSMENT

Assessment of the effects of an attack always is desirable and is required for certain important targets. The same assets that acquire targets often provide data on the effectiveness of the attack. The decision on which targets require assessment is made in the DECIDE function of the targeting process. Assessment may take many forms besides the determination of the number of casualties or equipment destroyed. Other information of use includes whether the targets are moving or hardening in response to the attack, changes in deception efforts and techniques, increased communications efforts as the result of jamming, and whether the damage achieved is having the expected effect on the enemy's combat effectiveness.

Assessments also are made passively through the compilation of information regarding a particular target or area. An example is the

cessation of fires from an area. If an assessment is to be made of an attack, the key personnel ensure that the intelligence or acquisition systems must receive adequate warning so the necessary sensors are directed at the target at the appropriate time. The assessment results cause battle plans and earl ier decisions to be changed. If necessary, the decisions made during the DECIDE portion of the process are reexamined. IPB products, the HPT matrix, the TSS, the attack guidance matrix, and the entire battle plan are updated. Assessment allows friendly forces to tune our efforts to achieve the greatest result with the least amount of expenditure or risk.

CHAPTER 8

INTELLIGENCE SUPPORT OF ELECTRONIC WARFARE OPERATIONS

EW is an IEW function that plays a critical role in the AirLand Battle. Intelligence support is essential to maximize the effectiveness of EW operations. This chapter describes how intelligence supports EW operations.

There is a special relationship between EW operations and intel l igence. EW, situation development, target development, and Cl are the four major tasks of the IEW mission. ESM, one of the three EW functions, supports both situation and target development. EW operations are not unique, however, because they require intelligence to be successful and also result in the acquisition of additional intelligence. Both maneuver and FS operations share this characteristic. EW is most effective when integrated and employed with FS and maneuver. Planning this integrated employment requires information that permits a comparison of the courses of action open to the commander. Sources of intelligence that provide support to EW operations and describe the intelligence used for specific EW functions are outlined below.

EW requires careful staff coordination to be effective. This includes coordination within the staff as well as coordination with the Ml unit executing the plan. The interactions involved are very similar to those seen in target development. The G3, in coordination with the G2 and the Ml unit, is responsible for the integration of ECM into the fire and maneuver scheme. The synchronized use of ECM and lethal attack requires the electronic warfare section of the G3 to coordinate closely and constantly with the FSE. To do this, the EWS and the FSO will often be collocated. ESM are also carefully coordinated between the G2 and the Ml battalion. The G2 ensures the ESM efforts are matched to the commander's PIR and targeting requirements. As these requirements change, the G2 coordinates with the Ml unit to update collection efforts.

INTELLIGENCE COLLECTION TO SUPPORT ELECTRONIC WARFARE

The collection of intelligence to support EW is a multidiscipline effort. HUMINT, IMINT, and SIGINT all contribute to the support of EW operations. HUMINT provides invaluable information, such as captured enemy communications-electron ics (C-E) operation instructions or an agent's photograph of an enemy code book contents.

IMINT provides location information important to jamming or intercept attempts and accurate data on the probable frequency ranges of enemy emitters. The size and shape of emitter antennas obtained from imagery provide indications concerning frequency data and other technical characteristics. A picture of an enemy CP or operational weapons site provides information about which types of emitter signals, both communications and noncommunications emissions, are associated with each other and with specific enemy deployments or weapon systems employment.

This information permits complex node analysis and parametric analysis of intercepted signals. This type analysis contributes to SIGINT support of EW.

Since SIGINT deals directly with information obtained from intercepted enemy signals, it provides the greatest volume of intelligence support to EW operations. SIGINT include the same functions as ESM. The primary difference between ESM and SIGINT is how the information is used. Generally, ESM produces combat information that can be used for target development (jamming and FS), maneuver, or threat avoidance with little systematic analysis or processing. SIGINT requires more extensive processing to produce intelligence. ESM and SIGINT are mutually supporting. Information collected through ESM is processed to produce SIGINT, which is essential to support EW. See FM 34-40, Electronic Warfare Operations, for a complete discussion on conducting EW operations.

THE EFFECTS OF TERRAIN AND WEATHER ON ELECTRONIC WARFARE

Signal propagation is affected significantly by terrain and atmospheric conditions. An analysis of these effects is included in any successful EW planning. The IPB techniques described in Chapter 4 of this manual and further discussed in FM 34-130, Annex F, provide a useful tool for evaluating and graphically displaying the effects of the terrain on EW operations. The analyst creates templates to depict possible enemy deployment of electronic systems for C^3, reconnaissance, TA, and REC. The analyst then compares the effects of the terrain on the employment of these assets based on a knowledge of signal propagation principles. Templates depicting locations of friendly ECM and ESM assets and knowledge of their capabilities also are used to help select friendly EW assets for employment against specific targets and indicate potential future deployment sites.

INTELLIGENCE REQUIRED FOR ELECTRONIC WARFARE SUPPORT MEASURES

The requirement to intercept, identify, and locate the sources of Threat electromagnetic emissions demands an extensive Threat electronic OB data base. Intercept operations require detailed intelligence on enemy frequency allocation and signal operating procedures. Identification is assisted by a knowledge of operating procedures; language recognition, to include specialized jargon, dialects, and code words; technical parameters of signals associated with specific functions or echelons; and the collocation of several types of emitters in a recognizable pattern which can be associated with a type of function or deployment. DF provides location data for ESM. As information is collected through ESM and used to support ECM, it also is compared with and integrated into data base information to be used for future ESM collection.

INTELLIGENCE REQUIRED FOR ELECTRONIC COUNTERMEASURES

Jamrning and electronic deception operations depend on current ESM data and all the intelligence required for successful ESM operations. Target receivers are jammed if LOS considerations permit it and the known frequency on which it is operating is capable of being jammed by friendly

ECM assets. However, indiscriminate jamming of target receivers is not the most efficient use of ECM assets. The most effective jamming requires information on the enemy's C^3 system so that the effects of disrupting a particular communications link is anticipated. This expected effect then is integrated into the commander's scheme of fire and maneuver.

Electronic deception operations depend heavily on intelligence. Both manipulative and simulative electronic deception require intelligence on the Threat SIGINT and ESM capabilities and a knowledge of friendly emission patterns and profiles. It would serve no purpose to simulate a friendly C^2 net or radar surveillance system if the opposing force cannot intercept or recognize these transmissions. Even the most simple imitative communications deception attempt, one designed to fool the operator of a clear voice net for only a few minutes, requires some knowledge of the target station's identity and the purpose of the net. A more sophisticated effort, one designed to confuse an enemy decision maker, requires not only detai led knowledge of the enemy communications system but also intelligence concerning the enemy decision-making process. If the deception effort involves intrusion into or imitation of an encrypted signal, the intelligence support may require an extensive multidiscipline effort. See FM 90-2A (C), Electronic Deception, for detailed discussion on electronic deception operations.

INTELLIGENCE REQUIRED ELECTRONIC COUNTER-COUNTERMEASURES

ECCM is divided into those measures designed to counter both ESM and ECM. The anti-ESM effort requires much of the same intelligence support required by manipulative and simulative electronic deception. The primary intelligence required concerns the enemy SIGINT and ESM capability evaluated in terms of the assessed vulnerabilities of friendly systems to such efforts. The counter-SIGINT effort requires technical information on the capabilities of enemy jammers and any intelligence on the capability of opposing forces to accomplish electronic deception. FM 34-60 provides detailed doctrine on counter-SIGINT operations. Threat doctrine on deception and information on the availability of the equipment necessary for Threat forces to implement deception activities is important. Multidiscipline intelligence efforts to obtain information on enemy ECM equipment before it is deployed is necessary if effective counter-countermeasures are to be established.

CHAPTER !3

COUNTERINTELLIGENCE ANALYSIS

Because the hostile intelligence collection threat arraved against US Forces and agencies is multidiscipline, Countering tnat threat aiso must be multidiscipline. Such an approach recognizes the need for a single program which counters all Foreign Intelligence Services collection as well as an analysis capability to bring it all together. The multidiscipline counter intelligence (MDCI) analytical effort is dependent upon information provided by the all-source intelligence system. It is found at various echelons of command. Specifically--

- The CI analysis section (CIAS) at division and corps,
- The CI analysts within EACIC at theater Armv commands.
- The intelligence and threat analysis center (ITAC) at DA.

MDCI analysis is by no means exclusive to Army agencies, but is a crucial activity of DOD. MDCI analysis operates through the DIA, and other federal agencies such as the CIA and the FBI. Highly trained, experienced, and skilled specialists perform MDCI analysis using the latest technology and modern methods of directing, processing, and disseminating.

The CI analyst uses the tools and skills identified in this chapter and Chapter 4, and as described in detail in FM 34-60. The intelligence analyst focuses on "how we see the enemy"; the CI analyst focuses on this and "how the enemy sees us." The CI analyst must also focus on how to counter the enemy's collection efforts. Where the intelligence analyst is a subject matter expert on the enemy, the CI analyst, in addition to having an in-depth understanding and expertise on foreign intelligence collection capabilities, must have a good working knowledge of the friendly force.

The CIAS must be collocated to integrate information fully with the ASPS. It must have access to all-source data that can be screened for CI use.

The CIAS is under the staff supervision of the Assistant Chief of Staff G2 and is found in the table of organization and equipment (TOE) of the EACIC at theater level; the corps tactical operations center support element (CTOCSE) at corps level; and the division tactical operations center support element (DTOCSE) at division level . An all-source mix of special ists is assigned to the CIAS to integrate their various skills and produce the MDCI analytical products required by the commander at each echelon. CIAS products are critical to the function of the G3 OPSEC and deception cells,

The CIAS mission is a diverse and all-encompassing MDCI analytical effort. The CIAS:

- Analyzes the multidiscipline intelligence collection threat targeted against friendly forces.

- Assesses enemy intelligence collection threat vulnerabilities and susceptibility to friendly deception efforts.

- Supports friendly vulnerability assessment.

- Along with the G3 OPSEC staff element, develops, evaluates, and recommends countermeasures to the commander. These countermeasures reduce. eliminate, or take advantage of friendly force vulnerabilties.

- Supports rear operations by identifying collection threats to rear area units and installations, to include low level agents responsible for sabotage and subversion.

- Nominates targets for exploitation, neutralization, or destruction.

- Develops and maintains a comprehensive and current MDCI data base.

- Tasks friendly intelligence collection resources through the CM&D section.

The CIAS focuses on hostile HUMINT, SIGINT, and IMINT collection.

COUNTER HUMAN INTELLIGENCE COLLECTION

Working in a concerted MDCI environment, counter human intelligence (C-HUMINT) analysts incorporate their efforts into the overall CIAS MDCI analysis product. C-HUMINT analysis includes:

- Analyzing and assessing the espionage, terrorism, subversion, treason, sedition, and sabotage threat.

- Analyzing enemy HUMINT collection capabilities and activities, and further analyzing how those collection capabilities can affect the friendly command.

- Analyzing level I (enemy controlled agents or partisan collection) and level II (diversionary and sabotage operations conducted by unconventional forces) threats.

- Recommending countermeasures and deception.

- Nominating targets for exploitation, neutralization, or elimination.

COUNTER SIGNALS INTELLIGENCE COLLECTION

Working in a concerted MDCI environment, counter signals intelligence (C-SIGINT) analysts incorporate their efforts into the overall CIAS MDCI analysis product. C-SIGINT analysis includes:

- Analyzing and assessing enemy SIGINT collection capabilities and activities.
- Comparing enemy collection systems capabilities against friendly targets.
- Identifying, analyzing, and assessing friendly electronic patterns and signatures.
- Analyzing friendly vulnerabilities against enemy SIGINT collection efforts.
- Subsequently recommending countermeasures and deception.
- Nominating enemy SIGINT targets for exploitation, neutralization, or destruction.

COUNTER IMAGERY INTELLIGENCE COLLECTION

Working in a concerted MDCI environment, counter imagery intelligence (C-IMINT) analysts incorporate their efforts into the overall CIAS MDCI product. C-IMINT analysis includes:

- Analyzing and assessing enemy imagery collection capabilities and activities, to include ground, air, and space threat systems. Threat systems include anything from hand-held cameras, to satellite platforms or fixed- or rotary-wing aircraft and unmanned aerial vehicles (UAV).
- Measuring enemy collection systems against friendly targets.
- Identifying, analyzing, and assessing friendly patterns, signatures, and vulnerabilities for subsequent development and recommendation of countermeasures and deception.
- Nominating enemy IMINT systems for exploitation, neutralization, or destruction.

OTHER INTELLIGENCE SUPPORT TO CI ANALYSIS.

MDCI cannot be conducted without the support of all three intelligence disciplines--SIGINT, HUMINT, and IMINT. These disciplines are used to collect critical information on enemy collection, analysis, and dissemination systems. Analysts extract the information from the all-source data base within the CIAS to determine enemy collection capabilities and operations. These systems, coincidentally, collect a great deal of intelligence on friendly forces. This intelligence is vital

in evaluating friendly profiles and thereby determining their vulnerabilities. If the situation warrants, CI analysts can task friendly collection systems to specifically collect intelligence on friendly forces for the CIAS through the CM section.

The CI mission mandates a wide range of functions and tasks that are accomplished in peace and at all intensities of conflict. CI operational activities perform such functions as investigations, operations, and collection. Their products are of great value to the MDCI analyst. To get the CI operational reports, the CIAS closely interfaces with the CM&D section to identify those items of CI interest coming into the CM&D from operational CI personnel. The CIAS must task and receive answers to those taskings through the CM&D section.

ANALYTICAL PRODUCTS

Each of the specialties assigned to the CIAS has individual responsibilities and skills which enable the production of single-discipline analysis products. When these products are combined into a comprehensive product, an MDCI product emerges. The CIAS then uses the MDCI product to nominate targets for exploitation, neutralization, destruction, or elimination. The MDCI products also provide OPSEC or deception planners with critical information required for their operations. Various specialists within the CIAS create the products discussed in the following paragraphs.

Counter Human Intelligence Products

C-HUMINT analysts maintain the C-HUMINT data base. Using this data base, they produce:

- Association matrixes.
- Activities matrixes.
- Time event charting.
- HUMINT communication diagrams.
- Link diagrams.
- HUMINT situation overlays.
- HUMINT-related portions of the threat assessment.
- Black, gray, and white lists.

The analytical techniques used in HUMINT analysis enable the analyst to visualize large amounts of data in graphic form. These analytical techniques, however, are only tools used to arrive at a logical and correct solution to a complex problem; the techniques themselves are not the solution.

There are three basic techniques (tools.) used as aids in analyzing HUMINT-related problems. They are time event charting, matrix manipulation, and link diagraming. Used together, these techniques are critical to the process of transforming diverse and incomplete bits of seemingly unrelated data into an understandable overview of an exceedingly complex situation. See FM 34-60 for detailed discussion on these techniques.

Counter Signals Intelligence Products

C-SIGINT analysts maintain the C-SIGINT data base. Using this data base, they produce:

- Threat fixed-base SIGINT matrixes. These are developed from the enemy collector characteristics data base and the threat fixed station data record.

- Mobile SIGINT matrixes. These are developed from enemy collector characteristics data base and threat OB and location data records.

- A system quick-reference matrix, providing a quick-reference of capabilities and limitations of those SIGINT systems which will most likely threaten that portion of the friendly command for which the analyst is responsible. This matrix is developed through manipulation of the data base to gain quick access to information concerning those systems which are the most likely threats to the corrrnand.

- SIGINT direction charts, portraying areas or targets of threat SIGINT concentrations. This is accomplished through integrating the EEOB overlay with the friendly electromagnetic overlay to determine areas susceptible to collection.

- SIGINT situation overlays. These are a continuous graphic update of the EEOB which depicts known or suspected threat SIGINT or REC positions. These overlays are continuously compared with the friendly electromagnetic overlay to identify susceptibility to collection.

- SIGINT-related portions of the threat assessment.

Counter Imagery Intelligence Products

C-IMINT analysts maintain the C-IMINT data base. Using this data base they produce:

- Threat SATRAN matrixes. (The definition for SATRAN is classified. See FM 34-60A for explanation.) These are designed to identify when and where a system is active and also show the collection characteristics of the system.

- Threat intelligence collection flight matrixes. These are similar to the SATRAN matrix, but are concerned "with other platforms used by the threat. Tracking these collection systems continuously allows the analyst to analyze threat IMINT collection patterns.

- System component quick-reference matrixes, including threat system's capabilities and processing times. This file is a part of the data base which equates to an OB file on threat IMINT systems.

- IMINT situation overlays. These overlays are the paths from the SATRAN and threat intelligence collection flight matrixes depicted on the friendly operations graphics. This identifies areas susceptible to collection.

- IMINT-related portions of the threat assessment.

COLLECTIVE CIAS PRODUCTS

The CIAS collectively prepares MDCI analytical products, ¡nc¡ud¡ng:

- Rear operations IPB (ROIPB) products.

- MDCI graphic summaries (MDCISUM).

- MDCI threat assessments.

- MDCI situation overlays.

- MDCI estimate.

Chapter 3 of FM 34-60 includes a detailed description on how a CIAS functions and details how to prepare single discipline and MDCI products.

The individual products of C-HUMINT, C-SIGINT, and C-IMINT analysts become the analytical tools used to produce the MDCI collective products. A brief description of each collective product follows.

Rear Operations Intelligence Preparation of the Battlefield

IPB is an analytical tool used throughout the MI community. When a greater need for intelligence support to rear operations surfaced, the IPB process evolved into a new dimension and ROIPB surfaced. However, ROIPB is not confined to the geographical boundaries of the rear area alone. In addition to analyzing information of the enemy collection threat located above and beyond the FLOT, it looks at the total friendly AO from the FLOT back. It does not dupl icate the IPB efforts of the ASPS, but rather complements their efforts. To avoid duplication, the CIAS must closely interface with the ASPS.

Like IPB, ROIPB is key in preparing for the next battle. Dur ing peacetime, RO¦PB builds an extensive data base for each potential area in which threat ¡ntelligence collectors or battalion size or smaller units might operate. It analyzes this intelligence base in detail to determine

the impact of enemy, weather, and terrain on operations and presents it in graphic form. It has the added ingredient of assisting in the assessment of friendly courses of action from the enemy's perspective.

Like IPB, ROIPB graphics can assist the commander in identifying targets as they enter the battle area. ROIPB and IPB threat evaluation and integration use the same analytical technique: templating. ROIPB templates are similar to IPB templates in the MBA. ROIPB templates provide a comparative intelligence data base that enables the CI analyst to graphically portray enemy intelligence collection and small unit capabilities; depict probable courses of action before and during the battle; and confirm or refute predictions. Like IPB templates, ROIPB templates are dynamic and require continual review. For additional details concerning RIOPB see FMs 34-130 and 34-60.

Multidiscipline Counterintelligence Summary

The MDCISUM is a graphic portrayal of the current enemy situation from a CI point of view. It graphically displays known enemy collection units, as well as level I and II threats within the friendly area. The MDCISUM ordinarily covers events within a 12-hour period. It portrays friendly targets which have been identified as potential enemy objective during the specified time frame. A clear and concise legend appears on each MDCISUM which contains: time period covered by the MDCISUM, map reference information, and symbols clearly identifying friendly and enemy information. Figure 9-1 shows a sample MDCISUM.

The use of-colors enhances an MDCISUM: but once reproduced, the disseminated product is black and white. Therefore, use dots, dashes, and slashes to ensure consumer understanding; explain these symbols in the legend. Subsequent MDCISUMs will not repeat information contained on previous MDCISUMs unless that information is critical to the current MDCISUM.

Multidiscipline Counterintelligence Threat Assessment

The MDCI threat assessment is a four-paragraph statement which is publ ished as often as necessary and when significantly changed, depending on the situation and the needs of the commander. As a general rule, the MDCI threat assessment is disseminated through CM&D with every third or fourth MDCISUM. The MDCI threat assessment provides justification for MDCI target nominations, a primary goal of MDCI analysis. Figure 9-2 shows an example of the format and substance of an MDCI threat assessment.

Multidiscipline Counterintelligence Situation Overlay

The MDCI situation overlay is a composite of the functional area overlays prepared by the subject matter experts assigned to the CIAS. The MDCI situation overlay incorporates the most important information from each of the other overlays. The functional area overlays serve as "<working" overlays, while the MDCI overlay is the master overlay and serves as the briefing overlay. It should be ready for briefings at all

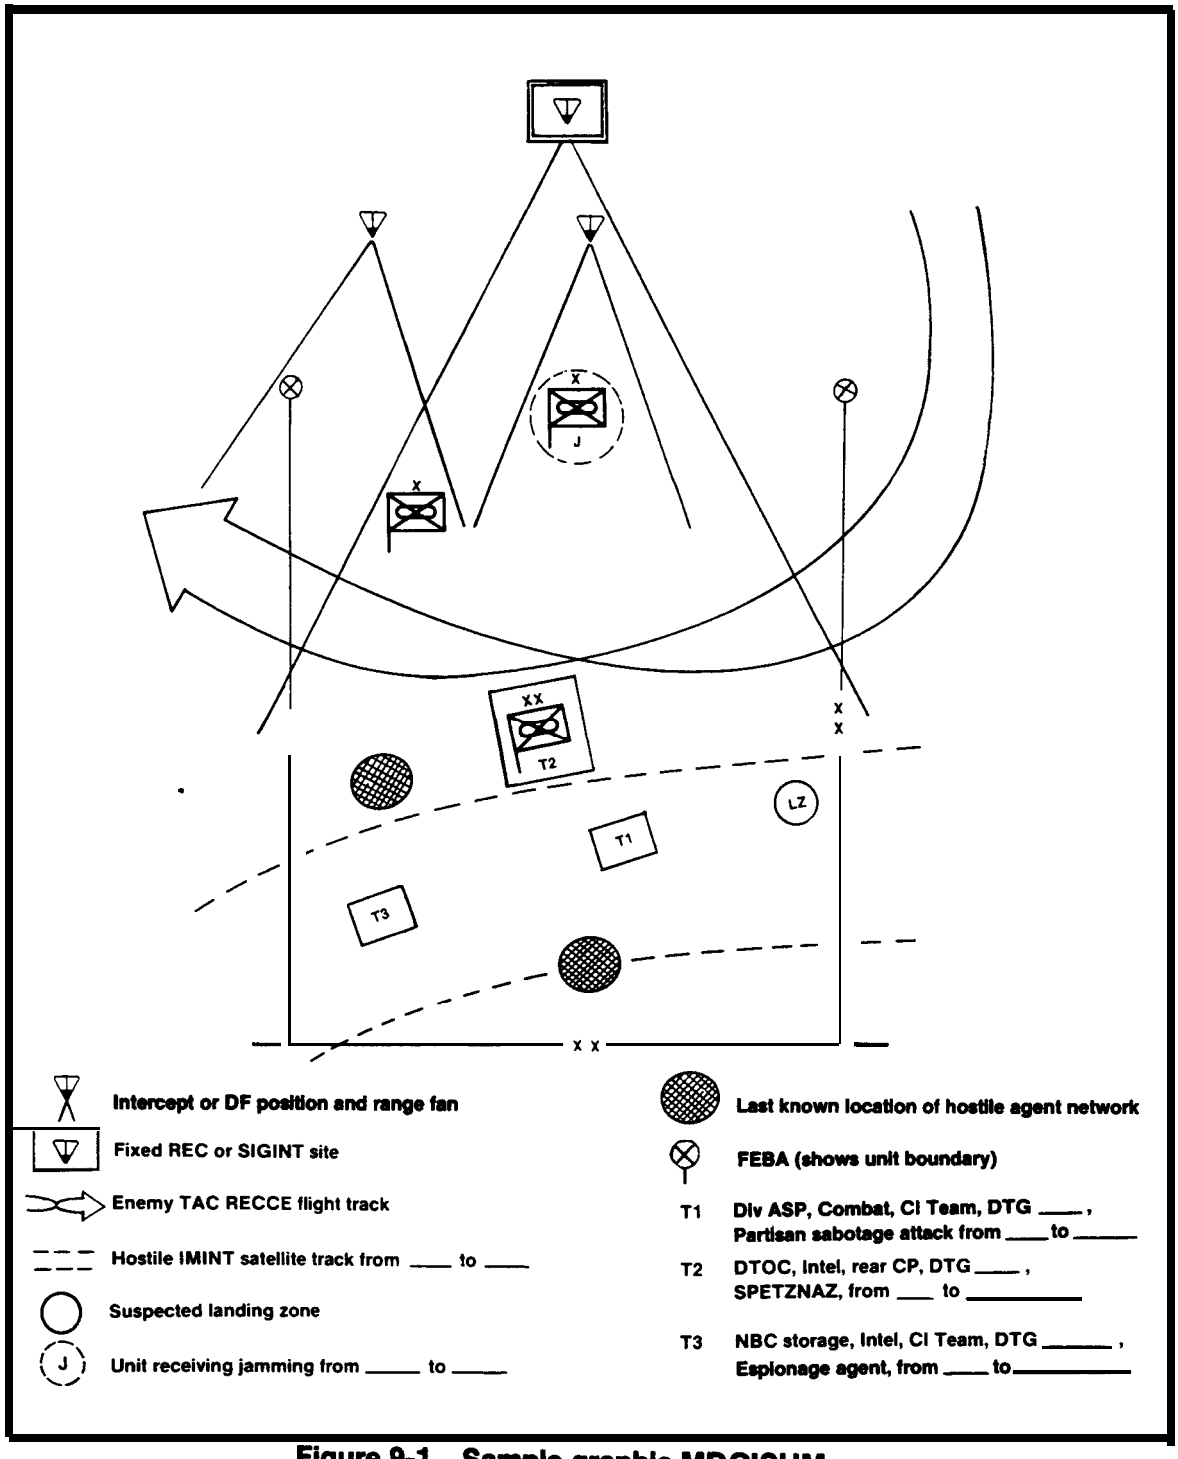

Figure 9-1. Sample graphic MDCISUM.

1. ENEMY ACTIVITY DURING PERIOD _____ TO _____ (LIST DTGs)

A. HUMINT: Summarize all known HUMINT activity during reporting period in one paragraph. Compile data from HUMINT situation overlay, matrixes, link diagrams, and MDCISUMs.

B. IMINT: Summarize all known IMINT activity during the reporting period in one paragraph. Compile data from IMINT situation overlay, matrixes, pattern and analysis charts, and MDCISUMs.

C. SIGINT: Summarize all known SIGINT activity during the reporting period in one paragraph. Compile data from SIGINT situation overlay, matrixes, direction charts, and MDCISUMs.

D. OTHER: Summarize all other enemy activity that is not already addressed using the same analytical tools.

2. INTELLIGENCE DAMAGE ASSESSMENT FOR THE PERIOD _____ TO _____ (LIST DTGs)

Briefly assess the intelligence damage to the friendly units for which the assessment is being prepared. Assessment is based on enemy collection activities that were traced, analyzed, and reported in MDCISUMs and were measured against the friendly force operations profile and countermeasures implemented by the friendly force. Coordination with G3 OPSEC staff element is essential in preparing this paragraph.

3. PROJECTED ENEMY ACTIVITY ASSESSMENT FOR THE PERIOD _____ TO _____ (LIST DTGs)

A. HUMINT: Using the same analytical tools identified in paragraph 1A, above, plus IPB, project or assess enemy HUMINT activity for the next reporting period.

B. IMINT: Using the same analytical tools identified in paragraph 1B, above, plus IPB, project or assess enemy IMINT activity for the next reporting period.

C. SIGINT: Using the same analytical tools identified in paragraph 1C, above, plus IPB, project or assess enemy SIGINT activity for the next reporting period.

D. OTHER: Using the same analytical tools identified in paragraph 1C, above, plus IPB, project or assess all other enemy activity for the next reporting period that is not otherwise addressed in the HUMINT, IMINT, or SIGINT assessments.

4. TARGET NOMINATIONS:

A. EXPLOITATION: Using aforementioned information and all other MDCI analytical tools, identify any targets worthy of exploitation. Provide

Figure 9-2. MDCI threat assessment.

recommended time frames, locations, methods of exploitation, justification, and any other pertinent data.

B. NEUTRALIZATION: Using aforementioned information and all other MDCI analytical tools, identify any targets worthy of neutralization. Provide recommended time frames, methods of neutralization, locations, justification, and any other pertinent data.

C. DESTRUCTION OR EXPLOITATION: Using aforementioned information and all other MDCI analytical tools, identify any targets worthy of destruction or elimination. Provide recommended methods for engagement. time frames, locations, justification, and any other pertinent data.

NOTE: All target nominations must have G2 or G3 approval before dissemination or presentation to the commander or designated representative for decision. Coordination with appropriate elements, consistent with type nomination, is essential.

Figure 9-2. MDCI threat assessment (continued).

CLASSIFICATION

Headquarters
Place
Date, Time, and Zone

MDCI Estimate Number _____.

References: Maps, charts, or other documents.

1. Mission: The restated mission determined by the commander.

2. The Area of operations: Summarizes the analysis of the AO.

a. Weather:

(1) Factors. Include light data and either a weather forecast or climatic information, as appropriate. Use appendixes for graphic representation or weather factors and other detailed information.

(2) Effect on enemy courses of action. Discuss the effects of weather on possible enemy courses of action (for example, sabotage, subversion, raids, air operations) in terms of mobility, concealment, and logistic sustainability. Discuss in terms of level I or II threat, and enemy all-source intelligence collection operations.

b. Terrain:

(1) Existing situation. Use graphic representatives where possible especially in regard to cover, concealment, and logistic

Figure 9-3. MDCI estimate.

sustainability. Use annexes for detailed information. Information covering observation, fields of fire, obstacles, key terrain, and approaches to the probable target aid in determining insurgent terrain. Also, consider graphics for critical facilities and buildings.

(2) Effect on enemy courses of action. Discuss in the same manner as for effects of weather in a(2) above. Discuss in detail those areas favorable and unfavorable to the levels of threat I or II enemy all-source intelligence collection opportunities.

(3) Effect on own courses of action. Discuss in the same manner as for effects of weather in a(2) above. Note the positive or detrimental effects on response forces and defensive measures.

c. Other characteristics. Include in subparagraphs any of the following factors or characteristics which are pertinent to friendly area activity (emphasis on rear area): population, ethnicity, religious makeup, literacy rate, medical considerations, economic stability, transportation, mass media, public services, and current political situation.

3. Enemy situation. Information on the enemy which will permit later development of enemy capabilities and vulnerabilities and refinement of these capabilities into specific course of action and their adoption.

a. Disposition. Reference may be made to overlays, enemy situation maps, or previously published documents. Location of potential threat forces may be difficult to pinpoint, but the greater the detail, the more thorough the analysis. Separate by level and type of threat (that is, combat (level I and II threats) or intelligence).

b. Composition. Summary of the OB of conventional level I and II threats, intelligence collection units and elements, and the structure or organization of paramilitary and/or terrorist groups. Separate by level and type of threat.

c. Strength. The purpose of this listing is to assist in developing enemy capabilities and vulnerabilities. Conventional and intelligence threats are discussed as in a regular intelligence estimate. Terrorist, paramilitary and other threats need to be assessed based on support from populace, monetary base, supplies, armament, personnel, and any other pertinent considerations. Subparagraphs should be used to address the different threats. Separate by level and type of threat.

d. Recent and present significant activities. Items of information are listed to provide bases for analysis to determine relative probability of adoption of specific courses of action and enemy vulnerabilities. Enemy failures to take expected actions are listed as well as positive information. Such a discussion should include recent all-source collection activities, terrorist actions, and other indications.

e. Peculiarities and weaknesses. For conventional and intelligence collection threats, discuss as in an intelligence estimate. For

Figure 9-3. MDCI estimate (continued).

terrorist, paramilitary, or other unconventional threats, discuss such pertinent information as leadership (key personalities), equipment, finances, and relations with the local populace.

4. Enemy capabilities. Based on all the previous information and analysis, develop and list enemy capabilities to conduct operations against the friendly area, with emphasis on the rear area. The listing provides a basis for analyzing the available information to arrive at those capabilities that the enemy can adopt as specific courses of action and their relative probability of adoption. Items should be separated by levels and type of threat.

a. Enumeration. State what, when, where, in what strength, and by what method for each enumerated threat.

b. Analysis and discussion. Each enumerated threat is discussed in terms of indicators of adoption or rejection. The intent is to assess the likelihood of a given threat taking a given action. This paragraph must consider all information previously recorded in the estimate. Some threats may not have any indicators of rejection listed due to insufficient data.

5. Potential enemy targets. Based on all previous information and analysis, develop, to the extent possible, a listing of potential enemy targets. Identify, at a minimum: target identity, capability, location or projected location, and projected intentions. Ascertain if targets can be exploited, neutralized, destroyed, or eliminated. Use subparagraphs and/or annexes as needed.

6. Conclusions.

a. Effects of AO on own courses of action. Indicate weaknesses in ability of response forces to react and in defensive measures.

b. HVT analysis based on the CARVE format (criticality, accessibility, recuperability, vulnerability, and effect). Such targets range from bridges to friendly units, public services, and key facilities. Complete for both friendly and enemy targets.

c. Probable enemy courses of action. Courses of action are listed in order of relative probability of action. However, insufficient data may only permit the probable level of threat for a given target.

d. Enemy vulnerabilities. List the effects of peculiarities and weaknesses that result in vulnerabilities that are exploitable.

Annexes (as required): Annexes may include graphic analysis products which support the estimate such as link diagrams, association matrixes, ROIPB products, or black, white, and gray lists distributed to units requiring them.

CLASSIFICATION

Figure 9-3. MDCI estimate (continued).

times. Ordinarily, the CIAS operations NCO is responsible for maintaining the overlay; however, its preparation is a collective effort of all members of the CIAS.

MULTIDISCIPLINE COUNTERINTELLIGENCE

The CIAS identifies the multitude of intelligence collection capabilities of adversaries on the battlefield. it then narrows the capabilities as accurately as possible to the actual collectors within an area, their targets, and the collectors technical characteristics. The CIAS also provides information to the battlefield deception (BAT-D) staff on the characteristics of friendly equipment so that an "as close as possible"' replication of a friendly force is displayed to enemy collectors. This is done during the development of the deception story in the planning process.

On today's technical battlefield, the friendly force assumes that hostile collectors are analyzing friendly patterns of C^3 to find HVTS. In friendly communications, mostly secure, the enemy must locate the communications externals that identify specific units or nodes. In electronic deception, these communications externals are replicated down to and including specific anomalies in friendly transmissions. Currently, analysis of such signals parameters is extremely difficult. C-SIGINT analysts research technical bulletins, coordinate with C-E staff members and maintenance personnel to collect this information as accurately as possible for the deception staff. As friendly deception equipment evolves into the future and becomes more sophisticated, friendly capability to provide the needed detail of support also must expand.

BAT-D elements become one of the main consumers of the integrated MDCI products. They use the MDCI estimate and graphic summary to determine where best to execute deception based on the collection effort.

Specific needs and requirements for BAT-D are passed through G3 channels to the CM&D at each echelon. The CIAS researches its data base to satisfy these needs with existing intelligence information. If the CIAS cannot satisfy the requirement immediately, it is validated and returned to the CM&D for appropriate tasking and requirements management. When the information is finally collected, it is passed through the CM&D to the CIAS for analysis and product development. It is then passed to deception planners so they can develop deception plans or execute the deception mission.

Since adversaries change the focus of intelligence collection as often as necessary, the CIAS analyzes its efforts continuously and passes the changes to the deception cell rapidly. This enables deception personnel to change focus and evaluate their effectiveness.

INTELLIGENCE SUPPORT TO COMBATTING TERRORISM

Terrorist activities are an ever-increasing threat to Army units. personnel, equipment, and operations, in peacetime and during conflict. CI personnel play a major role in supporting the force protection mission

through investigation, operation, and intelligence collection directed at terrorist groups and activities. The CIAS has an additional analytical role, using C-HUMINT techniques in this manual and fully explained in FM 34-60.

The MDCI threat assessment is an effective product for providing information to support the command force protection mission. The process includes educating the force on the threat, evaluating past activities of terrorists, maintaining a current data base, using pattern analysis, and predicting future activities and incidents. The CIAS also recommends offensive and defensive measures that may be effective in combatting terrorism.

Combatting terrorism is a shared mission among all members of the Army. The relationships between the operations staff, intelligence staff, and military police must be "locked in" completely to be effective. There are many other players who provide information to the process and to the intelligence analysis mission. Using the techniques of C-HUMINT analysis, the friendly goal is to track activities and associations, to predict the next terrorism act, to determine who is performing the act, when and where, and to get the information to decision makers who can do something about it.

CHAPTER 10

INTELLIGENCE SUPPORT TO COUNTERINSURGENCY

Recent history is characterized by the occurrence of numerous insurgences in developing nations. The US government has taken the responsibility to assist, upon request, selected emerging nations in developing political stability, economic strength, and social progress. Thus, the US may become involved in a LIC, either in an advisory and assistance capacity or as a combatant. The analyst plays an important role in all LIC operations including foreign internal defense and peace keeping. The focus in operations such as these is different than in counterinsurgency. Here the analyst is concerned with political questions such as, "How can the people be made to support tha government?" and 'Who is the enemy?"'

This chapter describes how information from all sources is analyzed to produce intelligence to support counterinsurgency. LIC includes counterinsurgency, but also foreign internal defense, peacetime contingence ies, and terrorism counteraction. These last three areas are beyond the scope of this FM.

When the level of US participation with a host nation is sufficient to be considered a combined activity, a combined intelligence operation is carried out. Combined intelligence operations facilitate more effective collection and production capabilities. The host country provides detailed knowledge and access to the populace, while the US Army provides technical expertise, management, and advice. There are often varying degrees of US and host nation cooperation.

The primary responsibility of intelligence personnel engaged in LIC is to produce intelligence to support the prevention or defeat of an insurgency. To defeat an insurgency, information is collected and intelligence produced on virtually all aspects of the internal defense environment. When insurgents are known to be receiving aid from an external power, it is necessary to obtain information on the role of the external power in the insurgency.

The target of the intelligence collection cycle (described in Chapters 1 and 2) for LIC differs from mid- to high-intensity conflicts only in its application to the production of specific intelligence required for counterinsurgency operations. In planning, for example, information is not only needed on the armed insurgents but also on their underground organization and their relations with the populace as well. In collecting information, the local population represents one of the most lucrative sources of information. In processing information into intelligence, sociological, economical, and political requirements have equal or even higher priority than conventional military needs. In addition to military users, US, host nation, and allied governmental, law enforcement, and intelligence agencies are valid users of intelligence products.

SUPPORT OF COUNTERINSURGENCY OPERATIONS

A sound collection program and proper use of the various collection agencies and information sources result in a very heavy volume of information which flows into the intelligence production element. The insurgent environment and its base area system and political and military tactics dictate that intelligence requirements can only be met by reporting minute detai Is on a great variety of subject areas. Each one of these details appear unrelated to others and insignificant by itself; but when mapped and chronologically recorded over long periods of time and analyzed with other details reported, they lead to definitive and predictable patterns of insurgent activity.

For example, as in a conventional conflict, IPB is conducted before and continues throughout a LIC. IPB not only helps identify patterns of insurgent activity, but helps use these patterns to predict future actions. Appendix E, FM 34-130 fully addresses IPB in support of LIC.

Insurgents usually recognize their shortcomings in military posture. The insurgent makes maximum use of the weather, the terrain, and the population, employing secrecy, surprise, and simplicity. Combat plans and orders are usually simple, comprehensive, and repetitive in order to be executed by widely separated forces. Therefore, the insurgent's solution to a problem is composed of a system or systems which together are complex, but apart are independent, having simple, logical, and uniform characteristics. In developing a pattern analysis or IPB products, it is important to chart insurgent and friendly tactical actions. As actions of friendly forces disturb the 'environment and patterns of insurgent activities, it forces the insurgent into unanticipated and unrehearsed situations which can be exploited tactically. Comrnunications intelligence (COMINT) is used to obtain direct insights into insurgent operations and plans. IPB helps the intelligence analyst answer two basic questions:

- Where can we expect to find the enemy?
- Where can we expect not to find the enemy?

The data to be developed and compiled by subject matter varies considerably with the intensity of the insurgent's operations. The types of overlays and categories of subjects plotted, therefore, vary extensively according to the needs. Using a graphic keying system and color schemes on large-scale maps greatly facilitate data analysis when superimposing transparent overlays.

INTELLIGENCE ESTIMATE

IPB provides a basis for the intelligence estimate. As with mid- and high-intensity operations, IPB products are used extensively in the estimate. There are, however, some significant differences from these to estimates that support LIC in general and counterinsurgency specifically:

- Emphasis is placed on different parts of the estimate. The mission statement, for example, may be more difficult to compose because of the wide scope of low-intensity operations and their relationships with the internal defense program.

- Emphasis is accorded nontactical considerations, such as psychological, political, sociological, and economic factors.

- Factors are to be compared during the deliberative process. Advantages and disadvantages of various courses of action may be more complicated than when terrain, weather, and a visible, tangible enemy are the chief factors to be considered.

The intelligence estimate for a LIC operation, as in any situation, is based on all available intelligence and considers everything of operational significance. See Appendix A for an example of a LIC intelligence estimate.

The initial intelligence estimate helps to point out gaps in the intelligence data base. These gaps are a basis for determining requirements.

A basic requirement in low-intensity operations is a thorough understanding of the target area. Knowledge of the target society requires a complete understanding of the internal and external forces at work, those supporting the integrity of the society, and those engaged in subverting it. Only when these factors are thoroughly understood can actions be effected. All available assets are used to provide this intelligence.

Commanders, intelligence staffs, and analysts recognize the impact that political, economic, and sociological factors have on tactical operations of the insurgent and friendly forces. This applies even to a very narrow, confined, and localized situation. Therefore, an intense and continuing study of local history and developments, contemporary personal ities, aspirations, and motivations is made. Because political, sociological, and economic factors are overlapping and interdependent, collation and interpretation of this data are extremely intricate and seldom are reduced to a formula similar to OB for mid- and high-intensity conflicts.

PROCESSING INFORMATION

Processing is the step in the intelligence cycle whereby information becomes intelligence. It consists of recording, evaluating, integrating, and interpreting. Chapter 2 describes information processing. Certain considerations are unique to the internal defense environment. To determine insurgent capabilities and courses of action and to provide the intelligence needed for all facets of LIC, the intelligence analyst is guided by an awareness of these considerations.

RECORDING

As in mid- and high-intensity situations, LIC requires large amounts of information on a continuous basis which are promptly compared with existing information and intelligence to determine their significance. To a large-degree, the extent of the recording effort depends upon the insurgent activity in the area and the analysts available to maintain and analyze the recorded information. All of the recording aids mentioned below, however, serve a unique and useful purpose in the overall intelligence production effort. Chapter 2 provides a detailed description of the journal, journal file, intelligence files, and intelligence workbook. Variations in recording devices which are unique to LIC occur in the use of annotated overlays and working files.

Annotated Maps

Depending on the echelon of responsibility, the state of insurgent activity in the area, and the degree of knowledge of the enemy, the intelligence analyst requires at least two annotated maps: the incident map and the insurgent SITMAP. Each of these recording devices normally is a transparent overlay covering a large-scale topographic map of the area. Unlike the workbook, which is maintained for individual use, the incident and insurgent SITMAPS provide a ready guide for briefing the commander, the civil authorities, or other interested parties. If activity in a particular area is limited, consideration is given to the combination of the two maps. Other annotated maps are valuable aids for recording information, depending on the needs in a particular headquarters' tactical area of responsibility. These special purpose overlays include records of--

- Mining and booby trap incidents.
- Insurgent names or codes for local terrain features, such as villages, areas, and trails.
- Insurgent assassination or resource collection attempts.
- Other significant activity.

It may be necessary to enlarge, with significant detail, certain AIs, either by drawing portions of the map to a larger scale, or by making a mosaic from aerial photos. Past, present, and potential insurgent activity must be visible with a detailed and thorough understanding of the environment. Comparison of the several annotated maps maintained often assist the intelligence officer in estimating the enemy's intentions and capabilities or to establish trends.

Incident Map. The incident map or overlay provides historical cumulative information on trends and patterns of insurgent activity. Properly maintained, the entries enable the intelligence officer to make judgments about the nature and location of insurgent targets, the relative intensity of insurgent interest in specific areas, insurgent control over or support from the population, and potential areas of insurgent operations.

Judgments concerning insurgent operations also require knowledge of terrain factors and insurgent limitations.

insurgent Situation MaQ. The SITMAP or overlay is prepared as part of the IPB process, and is modified as necessary by information from the incident map. It is difficult to pinpoint insurgent installations and dispositions with the same degree of confidence as in a conventional tactical situation. The insurgents can displace on short notice, making a report outdated before it is confirmed. While the SITMAP presents an uncertain and hypothetical picture, composed less of firm information than of reports of fleeting targets, estimates, and abstractions, it graphically substantiates the trends or patterns derived from the incident map. The analyst can then improve the economy and effectiveness of the R&S effort.

Trap Map. The trap map or overlay is used if the insurgent has a capability for sabotage or terrorist action. Data is directly annotated on the map on which the situation overlay is placed, or it can be kept separately. This map portrays particularly attractive target locations for insurgent sabotage or terrorism, such as road and railroad bridges, communications centers, theaters and assembly halls, and places where the terrain favors ambushes and raids. Such areas are identified and analyzed as part of the area study. They are plainly marked on this map with attention directed to possible insurgent access and escape routes. Photographs which are keyed to the map also supplement this effort.

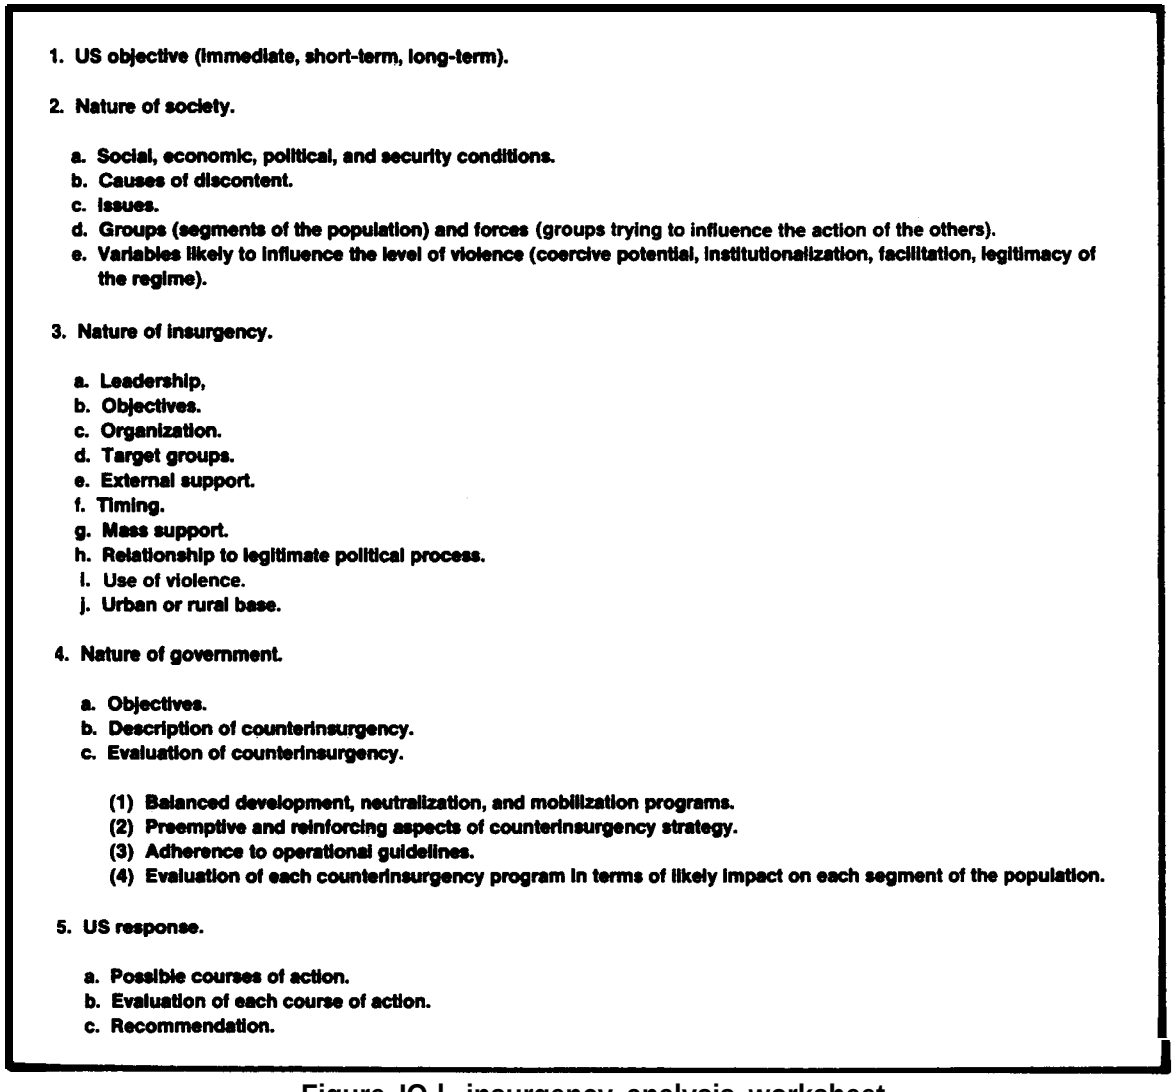
Population Status Map. This consists simply of an overlay to the SITMAP. Essentially, this map portrays the attitudes of the population, whether disaffected, loyal, or doubtful. Colors are used effectively to designate these conditions.

Personalities and Contacts Map. What is known initially about the insurgent situation primarily is information concerning locations and activities of individual agents of espionage, agitation, organization, and liaison. The appearances, movements, meetings, and disappearances of these agents are recorded on a personalities and contacts map or overlay. A large-scale map is required (a city street map or town plan if an urban area is involved). Deviations from regular patterns of movement are detected in this manner. Depending upon the number of personalities under surveillance, the regularity of their habits, and the variety of reports received on them, it is necessary to maintain a separate overlay for each subject. Old overlays are filed for comparison. Each agent's route is portrayed in a different color, and regularly traveled routes distinguished from new routes. Observations are dated and incidents noted by symbol. Depending upon the amount of insurgent activity, this map is combined with the incident map.

Working Files

The intelligence worksheet and the annotated maps serve to isolate problem areas and formulate relationships between items of information and intelligence collected. Extensive research material is required, however, to analyze these problem areas. in the early phase of an insurgency, the insurgent leader is building an organization. The leader's organizational

procedures and tactics, therefore, are unique, and familiarization requires the intelligence officer to study personal ities and incident analysis. Extensive working files, such as the insurgency analysis worksheet, hot files, current propaganda and psychological operations (PSYOP) file, personality and organization files, area study files, civil-military operations file, and resource reference files are established and maintained. Figure 10-1 shows an insurgency analysis worksheet.



1. US objective (immediate, short-term, long-term).

2. Nature of society.

   a. Social, economic, political, and security conditions.
   b. Causes of discontent.
   c. Issues.
   d. Groups (segments of the population) and forces (groups trying to influence the action of the others).
   e. Variables likely to influence the level of violence (coercive potential, institutionalization, facilitation, legitimacy of the regime).

3. Nature of insurgency.

   a. Leadership,
   b. Objectives.
   c. Organization.
   d. Target groups.
   e. External support.
   f. Timing.
   g. Mass support.
   h. Relationship to legitimate political process.
   i. Use of violence.
   j. Urban or rural base.

4. Nature of government.

   a. Objectives.
   b. Description of counterinsurgency.
   c. Evaluation of counterinsurgency.

      (1) Balanced development, neutralization, and mobilization programs.
      (2) Preemptive and reinforcing aspects of counterinsurgency strategy.
      (3) Adherence to operational guidelines.
      (4) Evaluation of each counterinsurgency program in terms of likely impact on each segment of the population.

5. US response.

   a. Possible courses of action.
   b. Evaluation of each course of action.
   c. Recommendation.

Figure IO-I. insurgency analysis worksheet.

Insurgency Analysis Worksheet. The insurgency analysis worksheet helps identify information and intelligence needed to satisfy the PIR and IR. It also provides a guide for analysis of a LIC environment.

Hot File. The hot file is the most important working file. It includes all available material pertaining to an incident or groups of possibly related incidents that are of current interest. This file contains material on persons or places likely to be involved in insurgent activity, together with material on agents or suspects who may be involved. A reported sabotage plot, for example, could initiate a hot file. The hot file remains active until the report is refuted, the incident occurs, the attention of the insurgent is diverted elsewhere, or friendly interest priorities change.

Current Propaganda and PSYOP File. If propaganda constitutes a major part of the insurgent effort in the area, a current propaganda and PSYOP file should contain all pertinent literature, background material, and analyses, to include copies of propaganda speeches and analyses of local grievances being exploited or subject to exploitation by the insurgents.

Personality and Organization Files. A local file is maintained on each insurgent personality. If surveillance is carried out by the local police, basic identifying and biographical information can be transferred from police dossiers to a card file. This card file helps train friendly surveillant to recognize key personalities on sight. The organization section of this file includes information on the history and activities of the insurgent organization's fronts, other subversive or suspected groups, and their officers, overlapping directorates, memberships, and liaison among these organizations. Figure 10-2 shows the format for a personality card file.

Area Study Files. Area study files contain up-to-date and pertinent data in the geographic, political, sociological, economic, and cultural fields. In low-intensity operations, even the lower echelon tactical commander, particularly when operating in the same general operational area over extended periods of time, has a definite requirement for such information. The intelligence staff officer should, therefore, have ready access to such data. The topical breakdown of such files concerns events and activities of continuing significance. Thus, for example, if rice is the basic staple in an economy, the topical breakdown includes files on rice production, distribution and marketing, price levels, and black marketeering and pilferage activities. Since this key economic indicator has continuing influence on friendly military operations as well as on the insurgent forces who depend on this staple for survival, careful analysis of this data over a period of time provides patterns based on which insurgent actions are anticipated and their capabilities predicted.

Resource File. A resource file includes all material which is of importance but are not of immediate value. It includes inactive incident files, inactive personality and organization files, and photography. The latter material is particularly useful. Air or ground photographs of places of interest are arranged chronologically by location and made readily available for use with hot files, incident maps, and trap maps.

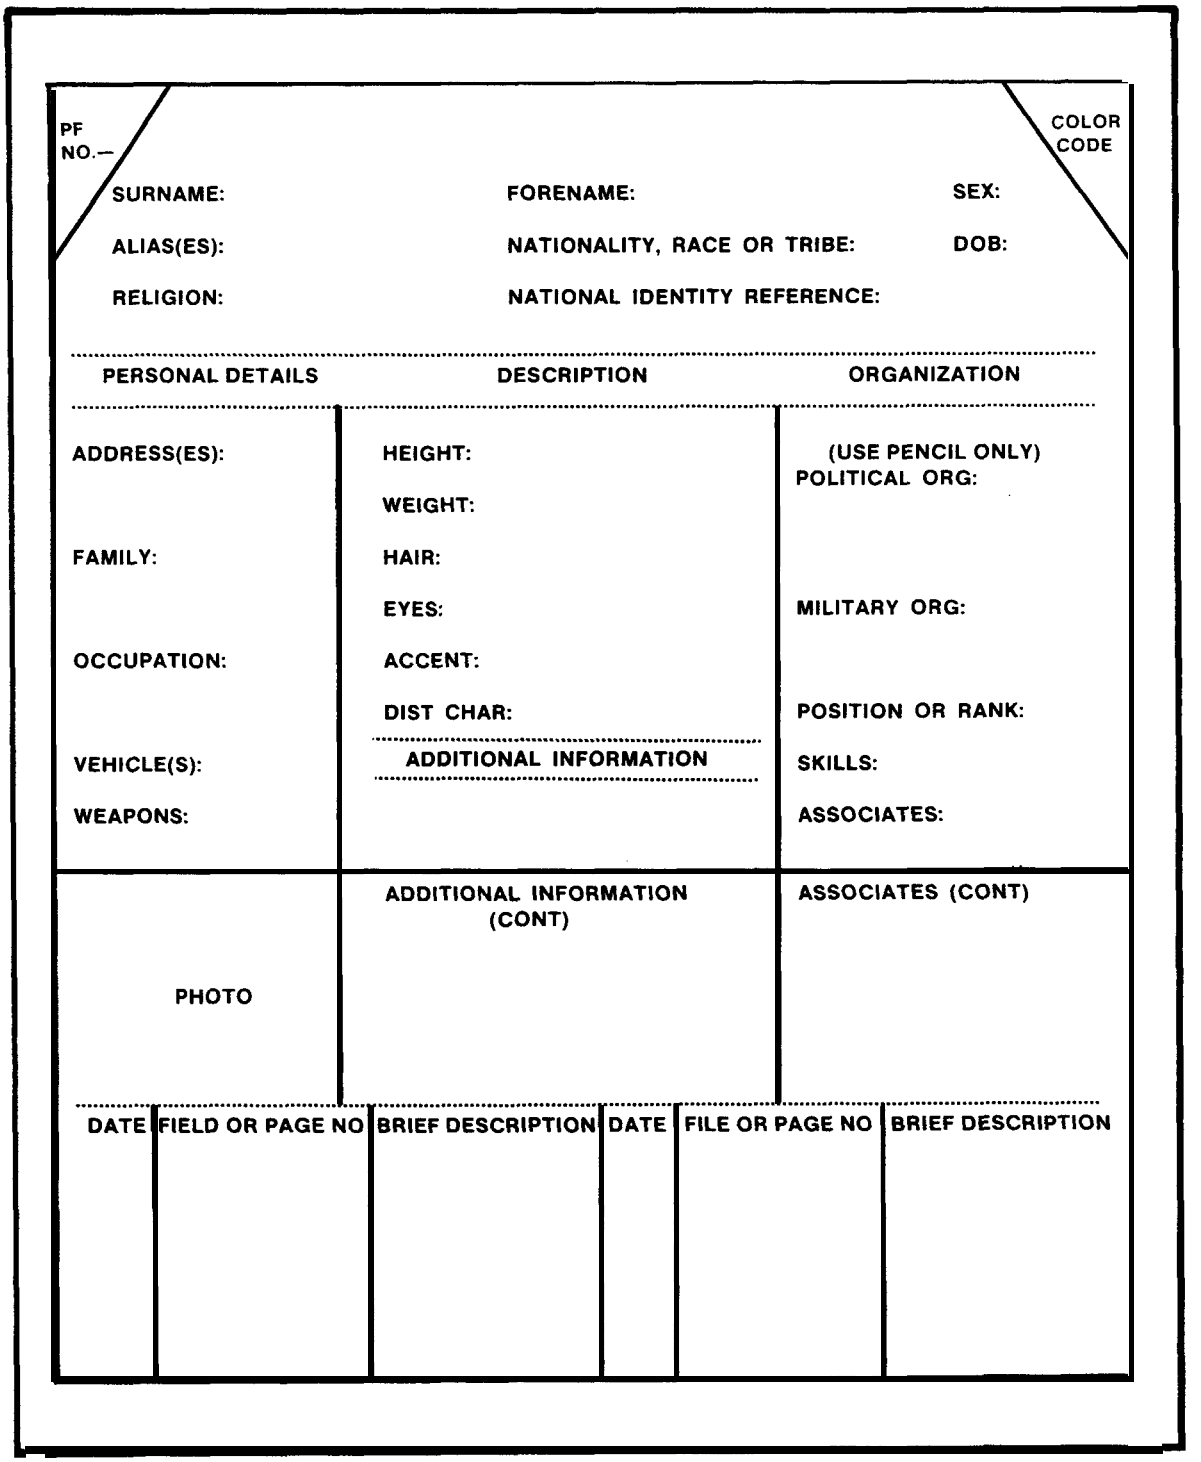


Figure 10-2. Personality card file format.

Reference Material. A library is maintained of reference publications, such as manuals on doctrine, tactics, and methods; books on the area and on the insurgent threat; files of newspaper and magazine clippings; and any other material which is of use. This material is kept at a central library serving the entire staff or located at an area coordination center.

Coordinate Register. The coordinate register is a valuable analytical tool , and method to store information during LIC situations. It illustrates activity in a particular area over a period of time, and is compact enough to be carried with ease. Each page represents a specific geographic area or town that the S2 determined. The coordinate register has two types of pages. One has written entries to record insurgent activity with space for the S2 to add comments. Figure 10-3 shows a sample written-entry coordinate register, applicable to a LIC.

ITEM	TIME	COORDINATE	ACTIVITY	NOTES
1.	150930	XK345678	MG harasses site	position patrol south of site
2.	152230	XK348672	farmer reports 10 guerrillas moving south	
3.	200140	XK348678	individual with binoculars seen observing site	increase friendly surveillance vic. of site

Figure 10-3. Written-entry coordinate register.

The second type of coordinate register is visual. Entries are plotted on the overlay square as they appear on the incident map.

The coordinate register assists in trend and pattern analysis and is a good way to store data, in an easily retrievable manner, for long periods of time. The written register allows easy evaluation of enemy activity by type action while the visual one allows rapid comparisons of activity between several time periods.

Civil-Military Operations File. A civil-military operations file includes all material and information concerning civil-military operations, their results, effectiveness, and any countermeasures the insurgents take.

EVALUATION

Evaluation is the determination of the pertinence of information to the operation, reliability of the source or agency, and accuracy of the information. In evaluating information, the knowledge and judgment of the intelligence analyst plays a major role. In determining the validity of a fact or whether a reported activity is at all possible, it must be realized that certain events are possible despite the fact that they did not previously occur and have been deemed by past analysis as unlikely to occur. Confirmation of information by other sources and agencies is always desirable, but it is not always possible to obtain. Initially, intelligence analysis commences with unconfirmed information which is subsequently supported, confirmed, or denied by the collection of additional and related information. As more information is obtained, the insurgent situation, capabilities, and probable courses of action become increasingly clear. As the body of intelligence expands, information that is not compatible with the current insurgent situation and is not consistent with the recent pattern of insurgent activity is suspect. Chapter 2 describes evaluation in detail. Procedures governing the assignment of evaluation ratings to sources and agencies have equal application in the internal 'defense environment.

INTEGRATION

Evaluated information becomes intelligence only after it has been integrated with other information and interpreted to determine its significance. Integration involves the combining of selected data to form a pattern which will have meaning and establish a basis for interpretation. It is important that the intelligence analyst is sufficiently alert to recognize all the possible patterns that may be formed. The following example illustrates the mental process of integration: The intelligence section of the area coordination center receives information that a prominent labor leader has been murdered. In a search for related information, the intelligence analyst checks the incident file, the friendly and suspect personality files, and the organization file.

The incident file reveals a series of murders that have been linked with the insurgent, with the primary victims being government officials, prosperous merchants, and large landholders who opposed insurgent objectives.

The suspect personality file reveals the labor leader's controlling position within a union that has recently intensified its criticism of the government. The personality file also reveals the labor leader's close association with several government officials and recent extensive travel throughout the nation.

The organization file indicates that the union has recently begun to disseminate antigovernment leaflets and has threatened to call a strike if demands for representation in the current government are not met. The other primary contender for union leadership is a relatively unknown newcomer.

Once all related items of information from the intelligence files are obtained, the intelligence analyst begins to assemble the available information to form as many logical pictures or hypotheses as possible. Alternative methods of assembly are an essential prerequisite to any valid interpretation.

Assembly of information to develop logical hypotheses requires good judgment and considerable background knowledge. In formulating hypotheses, the intelligence analyst avoids the limitations which result from preconceived opinions. In the example of the murdered union leader, the new information is integrated with existing intelligence in several different ways. By combining the murder with one set of facts, the labor leader is pictured as a loyal supporter of the government who became the victim of a campaign of selective terror undertaken by the insurgents. On the other hand, by combining the murder with another set of acts, the labor leader is portrayed as a member of the insurgent organization who was murdered for reasons not connected with the insurgency. As a third possibility, the labor leader may have been a member of the insurgent organization who was eliminated by the insurgents. Finally, there is a fourth possibility that the labor leader and the murder are not connected with the insurgency.

INTERPRETATION

Interpretation is the result of making deductions as to the probable meaning of new information and determining its implications with respect to future insurgent activity. The meaning of the information is determined in relation to the insurgent situation and the insurgents' probable courses of action.

For example, in the case mentioned above, if the labor leader was loyal to the government and was murdered for opposing insurgent control of the union, it reasonably is expected that further consolidation of insurgent control over the union, increased antigovernment agitation by the union, and possibly, an extension of insurgent terrorist activities will take place.

However, if the labor leader was a member of the insurgent organization and was murdered by the insurgents, it is conjectured that the elimination was due to considerable unreliability or slow progression toward the achievement of insurgent objectives. In this case, the prompt emergence of another insurgent union leader who ensures more rapid progress toward insurgent objectives is expected. It also is inferred, however, that the labor leader was murdered as a result of a struggle for power within the insurgent organization. In this case, weaker insurgent control of the union is expected due to the dissension among the insurgents.

Finally, if the labor leader had no connection with the insurgent organization and was murdered for reasons unconnected with the insurgency, this event has no significance from an intelligence standpoint.

DISSEMINATION

One of the more critical aspects of intelligence is the rapid dissemination of the information to personnel and units that nead information. Each information report is looked at immediately to see if it is of immediate concern. If so, it needs to be disseminated to affected units or personnel without delay. Successful intelligence reporting communicates the results of analysis and combat information to the right people, at the right time, and in the right format. It provides the commander with tha information and intelligence needed to raduce risk and uncertainty. The dissemination channel in a LIC varies llttle from the conventional environment but often there are more agencies and individuals to consider: police, potential terrorist targets, and other civilian agencies operating in the AO. Also, intelligence is disseminated to host nation military units.

Local SOP and guidance from higher headquarters dictate the amount and type of information that is given to civilian agencies and host national military forces. This question of releasability is resolved before effective dissemination can exist.

ORDER OF BATTLE

Chapter 3 describes the production of OB intelligence. There are certain OB considerations, however, which are unique to the insurgent enemy. OB intelligence is equally as important in an insurgency as in conventional combat operations. However, some differences in nomenclature and approach must be recognized. The applicability of the various OB factors differs in an insurgency from conventional operations, and there also are differences in applicability between phase I and phase II insurgency situations,

The elements of OB intelligence (OB factors) are not independent of each other; they are closely related and are considered as a whole, Information on one of the elements often leads to a reevaluation or alteration of information previously received on another element. Furthermore, the general rule, whereby OB intelligence is developed and maintained down to and including two echelons below the analyst's own level of command, does not apply to low-intensity operations. Due to the nature of the insurgency and the phased development of the insurgent forces, OB intelligence is produced in much greater detail and pertains to much lower echelons (even down to squad) than in conventional combat operations.

During phase I of an insurgency, subversive activities range from being only a potential threat to frequently occurring activities along an organized pattern. No major outbreak of violence or uncontrolled insurgent activity exists. The insurgent is primarily concerned with organizing infrastructure during this phase, along with conducting PSYOP and terrorist attacks.

Phase II of an insurgency begins when the insurgent has gained sufficient local or external support to initiate organized guerrilla warfare against the government.

A phase III insurgency occurs when the insurgent has transitioned from a guerrilla-oriented force to a primarily conventional-oriented force. FM 100-20 describes, in detail, the goals and activities of insurgent forces during all three phases. An important point to remember is that the insurgent may be operating from areas outside the host country during all three phases. Therefore, geographic boundaries cannot limit intelligence collection and analysis.

A listing of the OB factors follows, together with a brief explanation of their applicability and means in the context of insurgency situations.

COMPOSITION

In some insurgent movements, military force is only one of several instruments through which the insurgent movement seeks power. Development of a military force often has the lowest priority during the early stages of an insurgency. As long as the party core and civil organizations are established and move effectively toward the goal of the insurgency, the military arm either lies dormant or simply exists in cadre form until needed as a supporting force. Even after military organizations are fielded, the infrastructure never loses its importance. A counterinsurgency operation is never over until the infrastructure is neutralized.

Phase I Considerations

Rather than collecting information on the identification and organization of specific enemy units, we are concerned with the internal workings of insurgent activity groups. Knowledge of the composition of insurgent groups is a key to the entire planned course of the insurgency. Details of composition include the appearance of new organizations, the relative amount of enemy effort expended in rural and urban operations, the internal chain of C^2, and the manner in which insurgent groups are organized for operations.

Phase II Considerations

The intelligence analyst is concerned here with determining the composition of insurgent combat units, including their organization and chain of command. The degree of sophistication encountered indicates other factors, such as training, logistics, and strength. Armed platoons or small terrorist cells indicate that the overt military portion of the insurgents' plan is just beginning, and armed battalions and large urban terrorist groups indicate that there is a serious menace to the current government.

POLITICAL STRUCTURE

A tightly disciplined party organization, formally structured to parallel the existing government hierarchy in the country, is found at the center of some insurgent movements. In most instances, this organizational structure consists of comrnitted organizations at the village, district, province, interprovincial, and national levels. Within major divisions and sections of an insurgent military headquarters, totally distinct, but parallel, command channels exist. These are the military chain of command and the political channels of control. Whether it is through a political division of an insurgent military headquarters, a party cell or group in an insurgent military unit, or a unit political officer, the party ensures complete domination over the military structure by use of its own parallel organization. These party organizations fuel mil itary action. Should the military arm be eliminated, and the party left intact, only short-term security is achieved. The party begins construction of a new military organization. The population only is safe when the insurgent's political structure is rendered ineffective.

COMBAT FORCES

The organization of insurgent combat forces is dependent upon the need, the tactics to be employed, and the availability of personnel and equipment. Frequently, subordinate elements of insurgent units are employed independently. The intelligence analyst who receives a confirmed report of a subordinate element of an insurgent unit operating in the area cannot, therefore, assume that the parent unit is also present.

Identification of insurgent units are by--

- Number.
- Commander's name.
- Nickname.
- Code designation.
- Name of the area in which it operates.

Unit designations are frequently changed and multiple designations are often used to confuse friendly intelligence. It follows that the intelligence analyst is not able to determine the size and strength of an insurgent unit merely by obtaining a unit identification.

DISPOSITION

Determination of the disposition of the insurgent involves the location of operational training and supply bases, LOC, and areas of political control. The intelligence analyst arrives at potential dispositions of the insurgent combat forces by developing patterns of activity based upon map study and knowledge of insurgent tactics. Insurgent base areas, for instance, normally are located near areas that

the insurgents politically control, thereby providing an early warning system. By plotting insurgent sightings and combining this information with weather conditions, time factors, detailed investigation of insurgent incidents, and after action reports, the analyst best selects possible enemy dispositions as well as possible areas of tactical deployment. Consideration should also be given to areas where no insurgent activity is reported. These areas, while appearing to be under the control of internal defense forces, may be under the political control of the insurgents.

Phase I Considerations

The location, deployment within this location, and any movements of insurgent organizations or personnel are of concern here. The enemy's strength and tactics are revealed, to some extent, by discovering whether this effort is concentrated in a few places or dispersed throughout the target country and neighboring nations. If the enemy's effort is initially concentrated in one city or in one rural area, then the extent and spread of the insurgent organizations are a key to how long the enemy has been operational and how successful the enemy has been, and is an indication of the enemy's appraisal of friendly strength. In a nation considered a relatively easy conquest, the enemy begins with many operations, rather than a few. By studying the other available elements of 06 intelligence, the intelligence analyst determines such things as whether the movement of an enemy cadre or group is an advance toward new goals or a retreat from an unprofitable operation.

Phase II Considerations

How the insurgent forces are deployed indicates whether the enemy is making a widespread show of strength, with units scattered about the country, or is concentrating forces around a few key targets. It also shows whether the enemy is going to concentrate on such activities as interdicting transportation or actively seeking battle with government forces.

STRENGTH

The strength of the insurgent forces is thought of in terms of the combat forces, political cadres, and popular support. Conventional methods of strength computation are applied in determining insurgent combat forces strength. The analyst should be aware, however, that the insurgent will attempt to have strengths overestimated by low-intensity operations forces. To give this false impression, the insurgent employs rapid unit movement and uses multiple designations for a single element. Reports from the populace concerning the strength of the insurgent forces should be viewed with caution and the importance of actual counts of enemy personnel stressed. Certain insurgent-initiated incidents provide useful indicators of the strength of the insurgents in a particular area. An example of these is an increase in raids with subsequent loss of weapons by friendly forces. The determination of popular support for the insurgents is a more difficult task and is stated best in terms of the

percentage of an area under government control, as opposed to the percentage under insurgent control, with both viewed together in terms of population density. A useful indicator of the extent of insurgent political control is the willingness of the populace to report information concerning the insurgents.

Phase I Considerations

The cadre who organize and activate the movement usually are highly trained, aggressive professionals who exercise an influence disproportionate to their actual numbers. The analyst also is concerned with the number of enemy units in existence, which in phase I means identifying and evaluating new groups and organizations which have either appeared in the host nation or in neighboring countries and any changes in the size of existent groups. Other types of equipment, besides weapons, are of paramount interest. A printing press in phase I is a deadlier weapon than a battalion of artillery in phase III.

Phase II Considerations

The actual number of personnel available to the insurgent now assumes the importance it lacked, to some degree, in phase 1. By knowing also the amount of weapons and equipment available, estimates of capabilities against friendly forces are formulated. The degree of popular support for the insurgent manifests itself in such areas as recruiting for forces, tax or resource collection, and degree of population support for friendly forces.

TACTICS

Tactics include both enemy doctrine and the conduct of operations according to that doctrine. Insurgent forces are more flexible in their application of doctrine than regular military organizations. The doctrine which guides the insurgent must be known and understood by friendly forces if they are to effectively counter insurgent efforts. The careful examination of the tactics, or actual operational techniques, reveals changes in doctrine as well as indications of the personality and competence of the insurgent leader. Again, the choice and application of tactics is a reflection of insurgent appraisal of friendly strength as well as of personnel strength. A continuing estimate of relative strengths is a very basic part of insurgent operational planning and has an immediate effect on tactics. Tactics of the insurgent involve political, military, psychological, and economic considerations, all closely integrated. They vary with the phase of the insurgency. The political goal of the insurgents is to undermine and discredit the established government.

Phase I Considerations

Phase I insurgency is characterized by a relative absence of strictly military operations and an emphasis on subversion and organizational development. Although instances of terrorism begin to occur in the later

stages of phase 1, military activity is usually limited to recruiting and establishment of military cadres.

Phase II Considerations

An increased emphasis on the study and evaluation of insurgent military tactics is required. Tactics during phase II are generally limited to ambushes, raids, sabotage, and terrorism. These activities provide the insurgent with supplies, experience, and self-confidence, while at the same time they erode friendly morale and reduce friendly economic and military capabilities.

TRAINING

Insurgent training is closely related to the tactics being employed and includes vigorous indoctrination in political affairs. Both the combat forces and the people within an area under the political domination of the insurgents receive training. Insurgents carefully plan and train for individual operations and phases of movement. A careful analysis of an area with respect to the type of training taking place provides a useful indicator of the probable courses of action that are employed against friendly forces.

Phase I Considerations

During phase I, the insurgent trains and indoctrinates existing cadre as well as newly accepted or recruited indigenous personnel. Training consists of a great deal of political indoctrination along with techniques of propaganda, communications, and intelligence collection. Training and effectiveness go hand in hand; the type, amount, and val idity of training received by the insurgents is determined, to some degree, by any observed increase in the effectiveness or size of the insurgent movement. Some training normally is conducted in another country and is indicated by a change in number and type of personnel travel ing to that country.

Phase II Considerations

Much attention now is devoted to locating training camps and areas, identifying training cadres, and interdicting the movement of insurgents to and from out-of-country training areas. Some insurgent units are identifiable as having been trained for special missions, such as reconnaissance, demolition, or even suicide attack missions.

LOGISTICS

In an insurgency, as in a conventional warfare situation, the effectiveness of the insurgent is very much dependent on the logistical support. In the early stages of an insurgency, the requirements for military equipment and supplies are less than in the later stages. Accurate intelligence on the insurgent's sources and availab i lity of supplies and equipment is essential to determine the capabil i ty to maintain and expand the insurgency.

Phase I Considerations

Two particular items always are essential to the phase I insurgent--money and a printing press. If highly successful in the establishment and motivation of the power base, the insurgent never really has a requirement for the usual items of military supply. Money is often supplied from abroad, but such occurrences as bank robberies, unusual or excessive fund drives, payroll deduction requests, or sudden affluence among suspect government officials are cause for suspicion. Equipment for the production and dissemination of propaganda, like printing presses and radio sets, is of a special nature, and its acquisition by insurgent forces indicates an increasing level of sophistication in propaganda efforts.

Phase II Considerations

Logistics is now a larger and more elaborate requirement for the insurgent, who must now procure, store, transport, and maintain weapons, ammunition, explosives, signal equipment, and medical supplies. A much larger number of people are required to operate the logistical system. Insurgent supply caches or supply lines become items of critical concern to friendly forces. Borders and coastlines are controlled and aerial surveillance of remote areas or areas known to be used by the insurgents must be instituted to detect or deter the movement of supplies.

EFFECTIVENESS

Effectiveness describes the qualitative ability of the insurgent to achieve political or military purposes.

Phase I Considerations

In phase I, the term "combat effectiveness'" is usually not applicable. While the insurgent uses words like "struggle'" and "front,"' they do not connote the use of armed force. The overall effectiveness of the insurgent effort is sometimes made very obvious by spectacular successes (antigovernment victory in an important election) or failures (collapse of a new factory-worker organization known to have been backed by the insurgent), A continuing decline of governmental influence in a certain area or among a certain group of people may well indicate a corresponding increase in insurgent influence. The leaders forbid overt or easily detectable actions until they feel that their movement is in position to make a serious bid for power. In this case, the insurgent's real effectiveness remains unknown until it is too late for anything but a historical account of it. There usually is overt indication of the effectiveness of the insurgent operation, and information on it is gathered by careful observation of organizations, movements, and elections at all levels. Penetration of these activities by government agents is very desirable and makes a significant contribution to the OB picture.

Phase II Considerations

The factor of effectiveness now expands to include combat efficiency of insurgent military forces. By carefully evaluating the other OB factors, and taking note of actual combat experience, we evaluate the insurgent's combat effectiveness or lack thereof. We determine the insurgent's strengths and weaknesses and, from this, calculate the capability to follow various courses of action.

PERSONALITIES

Personalities are not listed as a separate OB factor in Chapter 3. In an insurgency, personal ities often assume a greater importance than in mid- and high-intensity conflicts.

Phase I Considerations

In phase I, personalities are an extremely important factor. During this phase, when the insurgency is just beginning to organize, function, and attempt to spread its influence, the loss of a comparatively small number of personnel practically destroys it or at least sets back its progress. Unfavorable publicity attached to the movement, as a result of exposure, renders its success less likely. The apprehension, compromise, or exposure of its leaders destroy the insurgency completely. Knowing who the insurgent leaders are also furnishes a valuable indication of how tactics and training are conducted and how effective the overall effort is.

Phase II Considerations

As in phase I, personalities remain a critical concern. Many insurgent units are cat led by their commander's name, rather than having a conventional designation.

ELECTRONIC TECHNICAL DATA

In the early stages, there is often a lack of uniform communications procedures, preventing the development of an extensive enemy electronic order of battle (EEOB) and electronic technical data base. There is very little use of noncommunications equipment, such as radar. The insurgents often use HF shortwave or ham radio sets to serve the initial "Committee of Correspondence'' function. VHF citizen band sets play a role in early terrorist operations. Equipment available to the insurgent ranges from the most primitive to the most modern. Even equipment not generally available in the armed forces of major world powers, I ike spread spectrum and frequency hoppers, is easily obtained.

Phase I Considerations

The propaganda requirements result in insurgent-sponsored medium frequency or commercial radio AM broadcasts. Transmitters are located outside the national boundaries or in remote, inaccessible areas. These broadcasts frequently use code words to control and coordinate insurgent

operations. Later, there is some increased use of VHF transmissions and more organized communications procedures. The standardization of communications practices reflects the level of communications training expertise.

Phase II Considerations

Much more extensive use of communications equipment characterizes this phase. Equipment is captured from government sources, purchased or stolen from commercial sources, provided by external sponsors, or locally manufactured. Communications procedures reflect doctrine and training practices of an external sponsor. Insurgents use repeater transmitters, set to receive and rebroadcast on the same frequency, to degrade VHF DF efforts against them.

MISCELLANEOUS

Any other items which contribute to knowledge of the insurgent, such as goals and methods, are considered here.

Phase I Considerations

This category includes such items as historical studies of people and parties involved in the insurgency, code names or numbers, and any' other information which does not fit under the other eight categories. "This type of information should not be slighted, as seemingly superfluous items may well become useful and important.

Phase II Considerations

Several miscellaneous items now become vital adjuncts to the other factors. Weapons, insignia, code names and numbers, types and colors of uniforms and flags--all these things aid in the identification of insurgent units, the source of outside aid, the source of weapons and equipment smuggled into or purchased in the target nations, and the morale and effectiveness of the insurgent armed forces,

OB FACTORS SUMMARY

There are three points to remember in the application of OB factors to an insurgency:

- The nine OB factors previously discussed are closely interrelated and cannot be analyzed separately.
- When an insurgency escalates from a phase I to a phase II situation, the OB effort is expanded considerably. The enemy combat units must now be considered in addition to the various phase I organizations and activities, which still are active.
- When an insurgency escalates from a phase II to a phase III situation, the application of the OB factors to the insurgent's combat units is the same as for other conventional forces.

APPENDIX A

REPORT FORMATS

The report formats described are standard formats used to report intelligence or information to task assets, or to receive information, intelligence orders, or instructions. These formats are echelon-specific, like the patrol report usually prepared at battalion level, or are general reports used at all echelons, like spot reports.

This appendix provides a brief description of the most common intelligence-related formats, including those formats used to pass information of immediate potential intelligence value from one echelon to another. It also identifies the echelon or echelons where each format is most used and the element or individual responsible for preparing it. An example of each format is also provided. Additional information about report formats is in Chapter 8.

SPOT REPORT

The SALUTE mnemonic requires users to report enemy size, activity, location, unit (or uniform), time, and equipment. Figure A-1 shows a spot report using a SALUTE message format.

```

INTELLIGENCE ESTIMATE

The intelligence estimate consists of five paragraphs. The first paragraph is a restatement of the mission. The remaining paragraphs outline an analysis of the battlefield area based on IPB; an estimate of enemy strengths, capabilities, and limitations; and the intelligence officer's conclusions about the total effects of the AO on friendly courses of action, the courses of action meet likely to be adopted by the enemy, and the effects of exploitable enemy vulnerabil ities. The five paragraphs are--

- Mission.
- Area of operations.

- Enemy situation.
- Enemy capabilities.
- Conclusions.

MISSION

Paragraph 1. Describe the mission in a short, clear, and concise restatement of the assigned or assumed mission of the command.

AREA OF OPERATIONS

Paragraph 2. Discuss what influence the AO has on probable enemy courses of action, based on facts and conclusions derived from IPB and an analysis of the AO if one has been prepared. A previously prepared analysis of the AO also is referenced. However, if previously prepared or other reference material is not contained in this paragraph, it must contain enough information to support the conclusions.

Weather and terrain analysis derived from IPB are always included in the characteristics of the AO. Other characteristics are included if they are important to either force in selecting courses of action to carry out their assigned or assumed mission. These other characteristics are of greater importance In AOs which have large civilian populations and to commands with extensive territorial or CSS responsibilities. Detailed or supporting terrain and weather information is included in an appendix to the intelligence estimate.

Weather or terrain effects on the use of nuclear weapons and chemical and biological agents are discussed when either combatant has the capability to use them. Each description of enemy courses of action includes the possible enemy or friendly use of these weapons, including the impact that weather or terrain conditions has on weapons systems and delivery means.

Weather

Weather conditions are those factors that impact on current and planned operations. This includes appropriate light data and either a weather forecast or climatic information. When operations cover a long period or are programed for a future operation, climatic information replaces weather data forecasts. Light data, in tabular form, includes the beginning of morning nautical twilight (BMNT) and beginning of morning civil twilight (BMCT), ending of evening civil twilight (EECT), and the ending of evening nautical twilight (EENT), moonrise, moonset, phases of the moon, and other information as required.

Terrain

The existing terrain situation includes the tactical aspects of the area: observation and fire, concealment and cover, obstacles, key terrain features, and AAs. Each of these aspects is oriented based on its

influence on selected courses of action by either force. For example, in a CSS unit, the discussion of concealment and cover is oriented toward influence on CSS courses of action, including installation locations required to accomplish the CSS mission and on enemy forces which interfere with the accomplishment of the mission. In CSS unit intelligence estimates, key terrain features are omitted unless the enemy has the capability to seize or control terrain features which materially affect the accomplishment of the mission.

Other Considerations

Other characteristics which are considered pertinent are sociology, politics, economics, and psychology, science, materiel, transportation, manpower, and hydrography.

The effects of each characteristic of the AO on possible enemy courses of action normally include consideration of weather, terrain, and NBC capabilities, the effects of these on other possible enemy courses of action, and the possible use of particular weapons, methods, techniques, or forces.

The extent of consideration for the factors is limited by the mission. For example, when the mission is offensive, the discussion does not include defensive courses of action. It does, however, include security considerations.

ENEMY SITUATION

Paragraph 3. Provide information on the enemy which permits later development of enemy capabilities and vulnerabilities. Establish the basis for refining these capabilities into a specific course of action and for determining the probability that the enemy will adopt this course of action.

Paragraph 3 provides the following data on the enemy:

- Disposition,
- Composition.
- Strength.
- Recent and present significant activities.
- Peculiarities and weaknesses.

Disposition

Enemy dispositions are the known or estimated locations and sizes of enemy units. References are made to overlays, enemy SITMAPS, or previously published documents when discussing enemy dispositions. However, if these references are not readily available, they (or a copy of them) are attached as appendixes to the intelligence estimate.

Composition

Composition is 06 data that is used to determine the strength the enemy uses to prevent the accomplishment of the mission. List all the units, including insurgent and guerrilla-type forces that contribute to this. Include such supporting units as air, nuclear delivery, and REC units that also affect the accomplishment of the mission. In determining which enemy units affect mission accomplishment, time and space factors are also considered.

Strength

Strength is all opposing enemy forces which are logically employed against the command in time to affect the accomplishment of the mission. The total forces listed cannot exceed, but is equal to or less than the total forces listed under composition.

Enemy strength includes committed forces, reinforcements, air assets, and NBC operations. Air or NBC operations units are omitted when the enemy lacks such capabilitles.

Committed Forces, Committed forces are those enemy ground maneuver units currently in contact and those ground maneuver units with which imminent contact is expected, regardless of the specific friendly course of action implemented. Designation of enemy forces as committed forces depends on disposition, location, controlling headquarters, and doctrine. For more information on computing enemy strength, see Appendix D.

Reinforcements. Reinforcements are those enemy maneuver units that are not committed in or out of the friendly sector, but react to the friendly course of action in time to influence the accomplishment of the mission. Contact with these units is not expected. Disposition, location, level of control , or other factors are considered in determining which enemy forces are reinforcements.

Enemy Air Capability. The enemy air capability is based upon numbers of enemy aircraft within operational radius, maintenance facilities, expected attrition, ground tactical situation, and other factors. The supporting tactical air force furnishes intelligence on the number of sorties, by type, which the enemy is expected to make within the field army or comparable areas. The estimate is not usually prorated below the field army level. Also, no attempt is made to calculate the number of sorties the enemy can or may make against a subordinate command of the field army or the communications zone (COMMZ). Corps, division, and COMMZ command intelligence officers usually quote the estimate furnished by the higher headquarters in stating enemy air capabilities. For example, a corps or division G2 might state: "30th Army estimates that the enemy can be expected to attack within the army area with as many as 150 fighter, 100 attack, and 75 bomber sorties daily. By massing all aircraft within operational radius, the enemy can make a maximum of 250 fighter, 300 attack, and 250 bomber sorties daily."

Nuclear Weapons and Chemical and Biological Agents. Estimates of enemy NBC capabilities usually are prepared at field army and hlglner headquarters. Units below field army level usually lack the means to gather the information to make such estimates. They use the estimates of the higher headquarters and modify them with available information.

The determination of enemy NBC operation capabilities is based primarily on estimates of numbers and types of weapons and amount and types of agents available, knowledge of enemy doctrine, past experience, and estimates of enemy capabilities involving the employment of ground troops. As with the enemy air capability, it is rarely feasible to estimate what portion of the available enemy NBC effort is used against a division or corps within a field army or a command in the COMMZ. It is also rarely feasible to estimate the number of nuclear weapons the enemy is capable of using within a period as short as one day. The period selected is a month or other period depending on the available information and past experience.

The statement of the enemy's capability to use chemical and biological agents includes the amount, typa, and delivery means of avai lab le chemica l and bio logical agents.

Recent and Present Significant Activities

This is a summary of recent and current enemy activities wh ich serve as indicators of future enemy actions. Significant enemy failures to take action also are listed. For example, if the enemy is apparently defending behind a river obstacle but has failed to destroy certain bridges, the omission is listed as a significant activity. Any basis for a belief that the enemy has specific knowledge of the friendly situation or intentions also is listed. For example, a capture by the enemy of an OPORD or a compromise of current signal operating instructions would be noted. For more information on enemy indicators, see Appendix C.

Peculiarities and Weaknesses

Briefly discuss each enemy peculiarity and weakness, indicating the extent to which it is a vulnerability and how it affects the selection of broad friendly courses of action. For example, if the enemy has an open flank, the fact is stated under operations. Discuss the extent to which the open flank constitutes an exploitable vulnerability. If enemy reserves are small and poorly positioned to extend the flank, the vulnerability may be great. If the enemy reserves are large and in position to extend the flank or counterattack an enveloping force, the vulnerability is probably insignificant. The G2 might state it as: "The enemy north flank is open. Available reserves are adequate to extend this flank a distance of only about 3,000 m. poSit ions to extend the flank have not been prepared. The enemy is vulnerable to a flank attack," Conversely, it might be stated as: "The enemy north flank is open. However, available reserves are adequate either to extend this flank beyond our zone, or to counterattack an enveloping force. Positions suitable to block an attempted envelopment have been prepared as shown on 'the enemy situation map." In the first statement, the enemy's

vulnerability to a flank attack is carried forward to conclusions of the intelligence estimate. In the second statement, the open flank apparently is not a vulnerability and is not carried any further. Another example: If the guerrilla forces are poorly equipped with antitank means of all types, the fact is stated under logistics, and the extent 'to which this is an exploitable vulnerability is discussed briefly. The intelligence officer might state: "The guerrilla forces in our area are poorly equipped with antitank means. They cannot effectively defend against armored vehicles" The inability to defend against armored vehicles is carried forward as a vulnerability to conclusions of the intelligence estimate. Figure A-2 shows some examples of enemy peculiarities and weaknesses.

PERSONNEL

-- Replacement situation (shortages or overages, particularly in specialists) .

-- Morale less than excellent, or exceptionally high.

-- Disproportionate number of very young or very old men.

-- High rate of sickness.

-- Percentage of authorized strength, if less than 80 percent.

INTELLIGENCE

-- Susceptibility to deception or neutralization of certain enemy information collection agencies.

-- Overdependence on one or more categories of information sources.

-- Ineffectiveness of enemy intelligence.

OPERATIONS

-- Habitual repetition of certain schemes of maneuver, or unconventional patterns of operations.

-- Faulty organization of the terrain.

-- Faulty disposition of reserves.

-- Susceptibility to electronic countermeasures.

-- Inadequate troop training, especially in defense against nuclear weapons or chemical agents.

-- Lack of adequate mobility.

Figure A-2. Example sof typical enemy peculiarities and weaknesses.

-- Inadequate air or artillery support, or nuclear weapon del ivery systems.

-- Pronounced failure to disperse and dig in.

-- Habitual failure to attack certain types of targets.

LOGISTICS

-- Shortages or inadequacies of particular supplies and materiel, including nuclear weapons.

-- Status of equipment, if less than 80 percent.

-- Large concentrations of supplies.

-- Location of vulnerable points and bottlenecks in the logistics system or lines of communications.

-- Inability to resupply during action.

-- Failure to equip troops with protective masks or protective clothing.

CIVIL-MILITARY OPERATIONS

-- Hostile attitude toward the civil populace, or of the civil populace toward the enemy.

-- Inadequacies in the control of civil communications, to include movement of civilians.

PERSONALITIES

-- Peculiarities or weaknesses of the enemy commander, major subordinate commanders, or principal staff officers as disclosed by or deduced from their past performance, education, politics, experience, or other basis.

Figure A-2. Examples of typical enemy peculiarities and weaknesses (continued).

ENEMY CAPABILITIES

Paragraph 4. List the enemy courses of action which tha enemy adopts and which influences the accomplishment of the friendly mission, either favorably or unfavorably. A properly stated enemy capability indicates what the enemy can do, when and where the enemy can do it, and in what strength. For example, "Attack (what) now (when) along our front (where) with five motorized battalions supported by all available nuclear weapons, artillery and air (strength). " Another example: "Conduct harassing operations (what) at any time (when) in our area (where) with about 200 guerrillas equipped only with small arms (strength)."'

The evidence considered in the analysis and discussion of enemy capabilities includes characteristics of the AO and positive or negative evidence of enemy activity, listed under recent and present significant activities. A major obstacle across part of the friendly area is evidence that attack elsewhere is more likely. Low ceilings and low visibility are evidence that the enemy is not using all available aircraft. Open, flat areas without any appreciable cover are evidence that the enemy does not use guerrilla or infiltration forces.

In analyzing and discussing each enemy capability or appropriate combination, the intelligence officer judges from the enemy point of view the advantage or disadvantage of adopting the capability. In making this judgment, the G2 or S2 also considers enemy doctrine and practices and the ultimate results of adopting or rejecting the particular capability. For example: "Employment of the unidentified tank division at TNOMYEH deprives the enemy of the reserves needed to counterattack a penetration by either of the two friendly divisions to our south. Commitment of this tank division too early will result in the later defeat of the enemy."

If there is no evidence of the enemy's possible adoption of a particular capability and the capability does not represent a major threat to the accomplishment of the mission, the intelligence officer does not judge it. For example, the enemy usually withdraws beyond our objective. Ordinarily, such withdrawal is not a threat to the accomplishment of the mission. If there is no evidence that the enemy withdraws, a statement of conclusions is omitted. The intelligence officer states: "There is no indication of withdrawal. "

CONCLUSIONS

Paragraph 5. State the intelligence officer's estimate of the--

- Total effects of the AO on friendly courses of action.
- Courses of action most likely to be adopted by the enemy, including their relative probability of adoption.
- Effects of enemy vulnerabil ities that can be exploited.

For a defensive mission, conclusions identify the best defense areas and the best AAs into the defense sector. For an offensive mission, the conclusion describes the best AA to the objectives.

Determine the enemy probable courses of action by the previous analysis and discussion of enemy capabilities. Consider how the enemy views the vulnerabilities as indicated by doctrine, past experiences, and the personality of the enemy commander. Consider previous enemy courses of action selected under similar circumstances. The determination is objective and not an unsubstantiated guess at what the enemy will do.

In determining the relative probability of adoption of enemy courses of action, the intelligence officer avoids conclusions based on friendly doctrine and practices. The officer considers the available evidence, to

include the enemy doctrine and practices, as well as positive or negative enemy activity, If enemy activity is not definitive enough to justify selection of the enemy's most probable course of action, the officer determines the most probable one based on the characteristics of the AO, enemy doctrine, practices, and previous experiences.

In the statement of the courses of action most likely to be adopted by the enemy, several capabilities are combined for brevity and clarity. However, all of the enemy capabilities combined in one statement are capable of being implemented at the same time. For example, the most probable enemy course of action is to: "Attack to envelop our northern flank, reinforced by corps reserve and using all available nuclear weapons, artillery, and air support; and conduct harassing operations in our rear areas with guerrillas and infiltrating forces. "

If more than one enemy course of action is stated, they are listed in the order of their probability of adoption.

An enemy vulnerability is any condition or circumstance of the enemy situation or the AO which makes the enemy especially liable to damage, deception, or defeat. Only those enemy weaknesses which are exploited are considered. In studying the enemy peculiarities and weaknesses to determine such vulnerabilities, the characteristics of the AO, all aspects of the enemy situation, and the enemy's doctrine and practices are considered. Only actual vulnerabilities are presented. An open northern flank which the enemy cannot, with available forces, extend or defend, is a vulnerability. If, however, the enemy has reserves which readily extend the flank to an impassable obstacle or counterattack to pin enveloping troops against that obstacle, the open flank is mentioned as a possible vulnerability, although the vulnerability may be eliminated by commitment of the enemy reserves. However, the commitment of reserves creates another vulnerability.

Each exploitable enemy vulnerability is listed as a brief statement of the effect of the vulnerability rather than a repetition of the peculiarity or weakness. For example: "Shortage of antitank means" is not stated. Instead, the effect of that weakness is given by stating: "Limited capability to oppose armored vehicles. " If the enemy's north flank is vulnerable, it could be stated as: "'Enemy northern flank open to envelopment subject to destruction of enemy reserves at . . . ."

In determining enemy vulnerabilities, the G2 or S2 considers the feasibility of their exploitation and makes appropriate recommendations to the G3 or S3. All enemy vulnerabilities are not exploited at the same time. The exploitation of one vulnerability precludes the exploitation of another vulnerability.

For example, the enemy is vulnerable to both a night penetration and a daytime flank envelopment. The G3 or S3, in coordination with the G2 or S2, recommends to the commander the priority of vulnerabilities to be exploited. Based on the information in this appendix and in Chapter B, Figures A-3 through A-5 show the formats for the annotated intelligence estimate, sample intelligence estimate for a division, and an annotated intelligence estimate for stability operations.

Time Zone Used Throughout the Estimate:

(Short title identification)

1. MISSION. The restated mission determined by the commander.

2. AREA OF OPERATIONS. This paragraph discusses influence of the battlefield environment in arriving at conclusions. It is based on the facts and conclusions of IPB and the analysis of the battlefield area, if one has been prepared. It may be a reference to an analysis of the battlefield, if adequate coverage and discussion are contained therein.

a. Weather.

(1) Existing situation. Include light data and either a weather forecast or climatic information, as appropriate. Use appendixes for detailed information.

(2) Effect on enemy courses of action. Describe the effects of weather on each broad course of action (such as attack or defend). Each description concludes with a statement of whether the weather favors the course of action. Among the courses of action, include use of chemical agents, nuclear weapons, and special methods, techniques, equipment, procedures, or forces.

(3) Effect on own courses of action. Describe in the same manner as for (2) above, except that the estimate excludes the use of biological agents.

b. Terrain.

(1) Existing situation. Use graphic representations, such as IPB templates, where possible. Use annexes for detailed material. Include as much information as necessary for an understanding of observation and fire, concealment and cover, obstacles, key terrain features, and AAs. Include effects of nuclear fires, enemy biological and chemical agents, and any other pertinent considerations on each of these factors as appropriate.

(Classification)

Figure A-3. Annotated intelligence estimate.

(Classification)

(Short title identification)

(2) Effect on enemy courses of action. Describe in the same manner as for the effects of weather in a(2) above. For defensive courses of action, state the best defense area and the best AAs leading to it. For attack courses of action, state the best AAs.

(3) Effect on own courses of action. Describe in the same manner as for effects of weather in a(3) above.

c. Other Characteristics. The following additional characteristics considered pertinent are included in separate subparagraphs: sociology, politics, economics, psychology, and other factors. Other factors may include such items as science and technology, materiel, transportation, manpower, and hydrography. These factors are analyzed using the same subheadings as weather and terrain.

3. ENEMY SITUATION. This paragraph gives information on the enemy which will permit later development of enemy capabilities and vulnerabilities and refire ment of these capabilities into a specific c urse of action and its relat ve probability of adoption.

a Disposition. Reference may be made to over ays, enemy situation maps, or previously publ ished documents.

*

b Composition. Summarize enemy OB that can influence accomplishment of the mission. Reference may be made to previously published documents. Special mention is made of units capable of EW, low-intensity operations, and other special operations, as appropriate.

c. Strength. Enemy strength is listed as committed forces, reinforcements, air assets, nuclear weapons, and chemical and biological agents. The purpose of this listing is to assist in developing enemy capabilities and vulnerabilities for use by the commander and staff in selecting courses of action. The unit mission, location of the enemy, enemy doctrine, and the level of command at which the estimate is being prepared are factors to be considered.

(Classification)

Figure A-3. Annotated intelligence estimate (continued).

(Classification)

(Short title identification)

(1) Committed forces. List those enemy ground maneuver units currently in contact and those ground maneuver units with which imminent contact can be expected, regardless of the specific friendly course of action implemented. Designation of enemy forces as committed forces depends on disposition, location, controlling headquarters and doctrine. The intelligence officer usually accounts for committed forces based on the size unit doctrinally used to oppose the friendly unit. Generally, enemy units are counted in terms of units two echelons below the friendly unit's size (for example, a brigade S2 normally considers committed forces in terms of companies; a division G2, in terms of battalions; and a corps G2, in terms of regiments). If there is doubt whether a unit is a committed force or a reinforcement, it is considered a reinforcement.

This attributes to the enemy the maximum capability to reinforce forces to oppose a given friendly course of action.

(2) Reinforcements. Include designation and location. Reinforcements are those enemy maneuver units that may or may not be employed against us, depending on our choice of a specific course of action and enemy plans. Reinforcements are enemy units not committed in or out of the friendly sector, but which can react to the friendly course of action, subject to time and distance considerations, in time to influence the accomplishment of the mission. Imminent contact is not expected. Disposition, location, level of control, or other factors at the time of the estimate are considered in determining which enemy forces are reinforcements.

(3) Air. List the number of enemy aircraft by type within operational radius. Include the number of possible sorties per day by type of aircraft, if known.

(4) Nuclear weapons and chemical and biological agents. Estimate, as appropriate, the number, type, yield, and delivery means of enemy nuclear weapons and chemical and biological munitions or agents available to the enemy.

d. Recent and Present Significant Activities. List selected items of information to provide bases for analyses to determine relative probability of adoption of specific courses of action and enemy vulnerabil ities. Enemy failures to take expected actions are listed, as well as positive information.

(Classification)

Figure A-3. Annotated intelligence estimate (continued).

(Classification)

e. Peculiarities and Weaknesses. Based on knowledge of enemy tactical doctrine, practices, the principles of war, the AO, and the enemy situation previously described and discussed, list peculiarities and weaknesses, and briefly describe each, indicating the extent to which they may be vulnerable and how they influence possible friendly courses of action. The items listed are grouped under the headings indicated below. Only pertinent headings are used.

(1) Personnel. An estimate of strength usually is included if less than 80 percent of authorized strength. Status of morale is included, if known.

(2) Intelligence. An estimate of enemy intell igence success, ineffectiveness, and susceptibility to deception and detection is usual ly included.

(3) Operations. An estimate of combat effecti veness is usually included if less than excellent.

(4) Logistics. An estimate of the enemy's capability to support their forces logistically is included if there are apparent weaknesses.

(5) Civil-military operations. An estimate of the attitudes of the enemy and the civilian populace and the status of food supply, medical facilities, communications, and other critical resources is usually included.

(6) Personalities. An estimate of the capabilities and or weaknesses of the enemy commander and principal staff officers usually is included.

4. ENEMY CAPABILITIES. Based on all the previous information and analyses, develop and list enemy capabilities. The listing provides a basis for analyzing the available information to arrive at those capabilities the enemy can adopt as specific courses of action and their relative probability of adoption.

a. Enumeration. State what, when, where, and in what strength for each capability.

(Classification)

Figure A-3. Annotated inteiiigence estimate (continued).

(Classification)

(Short title identification)

b. Analysis and Discussion. To provide a basis for conclusions of enemy capabilities and their relative probability of adoption, each capability, or appropriate combination thereof, is discussed in a separate subparagraph. Consideration of enemy deception measures is included. All the pertinent previous information and conclusions are tabulated as either supporting or rejecting the adoption of the capability. After listing all the evidence, each capability is judged from the enemy point of view of whether the adoption of the capability is advantageous to the enemy. Such judgments need not be made if the conclusion is obvious or if there is no evidence that the enemy will adopt the capability, except when the capability is one that will make the accomplishment of the friendly mission highly doubtful or impossible. This exception is to focus attention on dangerous threats.

5. CONCLUSIONS. Based on all the previous information and analyses, conclusions are stated concerning the total effects of the AO on friendly courses of action; the courses of action most likely to be adopted by the enemy, including their relative probability of adoption; and the effects of enemy vulnerabilities that can be exploited. These conditions assist in the selection of a friendly course of action.

a. Effects of Intelligence Consideration on Operations. Indicate whether the mission set forth in paragraph 1, above, can be supported from the intelligence standpoint. Indicate which courses of action can best be supported.

b. Effects of the AO on Own Courses of Action. For attack courses of action, indicate the best AAs. For defensive courses of action, indicate the best defense areas and the best AAs leading to and into the defense areas. (This subparagraph is omitted if the discussion of the effects of the area on own courses of action in paragraph 2 has been omitted because of the availability of a current analysis of the AO.)

c. Probable Enemy Courses of Action. List courses of action in order of relative probability of adoption. A listed course of action may include several subordinate courses of action that can be executed concurrently. Usually, no more than two or three courses of action, in order of probability of adoption, can be justified by the available evidence.

(Classification)

Figure A-3. Annotated intelligence estimate (continued).

(Classification)

(Short title identification)

d. Enemy Vulnerabil ities. List the effects of peculiarities and weaknesses that result in vulnerabilities that are exploitable at own, higher, or lower levels of command. The order in listing these vulnerabil ities has no significance.

INTELLIGENCE EST MATE NO 20
Reference: Map, series East and, sheets Delta through Kilo, edition 2, 1:50,000 Time Zon e Used Throu ghout the Estimate: Zulu.

1. MISSION. 52d Div defends along Dry Creek and prepares to attack on order.

2. AREA OF OPERATIONS.

a. Weather.

(1) Existing situation. Weather for the period 23 to 28 June #ill be rainy and cool, gradually warming and clearing as a high pressure system moves through the AO from the south. Temperatures from 40 to 65°F . Visibility will range from 16 to 25 kilometers, except during precipitation and in morning fog in low drainage areas. Surface winds from the south at 8 to 10 knots.

Date	BM-NT	BM-CT	EE-CT	EE-NT	Moon-rise	Moon-set
23 June	0331	0419	2029	2130	1746	0125
25 June	0339	0422	2025	2124	1907	0214
27 June	0344	0425	2022	2118	2001	0518
28 June	0349	0428	2018	2112	2022	0820

(2) Effects on enemy courses of action:

(a) Precipitation will not hinder cross country movement except in the low drainage areas of Minertown.

(b) Southerly winds will not affect enemy employment of NBC.

(c) Low visibility during precipitation and morning fog will favor enemy attack.

(3) Effects on friendly courses of action:

(Classification)

Figure A-4. Sample division intelligence estimate.

(Classification)

(a) Precipitation will not hinder cross country movement except in the low drainage areas of Minertown.

(b) Southerly wind direction will not affect friendly use of chemical or nuclear weapons.

(c) Low visibility during precipitation and morning fog will not favor friendly defense.

b. Terrain.

(1) Existing si tuation.

(a) Cover and concealment. Wooded areas around Midway offer good concealment. Numer ous ravines in drainage areas of Minertown offer limited cover and concealment.

(b) Observation and fire. There are good observation points along bluffs above Gringo River. Fields of fire are excellent throughout plains areas north of Mud Creek but limited moderately in populated and vegetated areas near Glenville.

(c) Obstacles.

1 Swift River (fordable 1 km east of Glenville).

2 Bluffs above Gringo River.

3 City of Glenville. Routes around city are passable; routes through city impassable.

(d) Key terrain. Hill mass Jackson and Hill 333.

(e) AAs.

1 Available to the enemy into our sector:

a AA 1 is from Largo through gap around the northeast end of HILL 702, 34 km southwest to Minertown and south to Dry Creek.

b AA 2 is from Largo southeast through Midway to river crossing east of Glenville.

(Classification)

Figure A-4. Sample division intelligence estimate (continued).

(Classification)

2 AA available for US movament into the enemy's area is generally the same as those I isted for enemy into our sector.

(2) Effect on enemy courses of action. Terrain favors the enemy attack using AA 1.

(3) Effect on friendly courses of action. Terrain favors our defense of the srea around Dry Creek.

c. Other Characteristics.

(1) Existing situation. Local nationals throughout the area favor friendly military operations. Large numbers of refugees can be expected to pass through friendly lines.

(2) Effect on enemy courses of action. The enemy can be expected to insert infiltrators as refugees.

(3) Effect on friendly courses of action. Refugees can be expected to provide valuable inteliigence.

3. ENEMY SITUATION.

a. Disposition. Annex A, Situation Overlay.

b. Composition. Enemy forces opposing 52d Div consist of elements of the 4th Combined Arms Army.

(1) Identified units are--

(a) 10th MRD consisting of--

--27th MRR.
--30th MRR.
--31st MRR.
--121st Tk Regt (unlocated).

(b) 19th Mech Div consisting of--

--23d MRR.
--37th Tk Regt.

(2) Unidentified units are: 2 x U/l MRR of 19th MRD.

(Classification)

Figure A-4. Sample division inteiiigence estimate (Continued).

(Classification)

c. Strength.

(1) Committed forces. 52d Div (Mech) is opposed immediately by four mechanized battalions and one tank battalion. These units are supported by normal divisional and regimental artillery groups.

(2) Reinforcements. Reinforcements available to the enemy for commitment in our zone are a total of five MRB and four tank battalions from the 27th MRR, 121st Tk Regt, and the second-echelon battalions of the 30th and 31st MRRs and the 37th Tk Regt. Also, the 23d MRR can totally reinforce within 8 hours from start of movement.

(3) Air. Enemy is supported by the 3d Air Army consisting of unidentified numbers of fighter-bomber aircraft, ground attack aircraft, and reconnaissance aircraft. Air parity currently exists with either force capable of obtaining air superiority for limited periods of time. Up to now enemy has used a maximum of 60 fighter-bomber sorties in a 12-hour period.

(4) Nuclear. No estimate of the enemy's nuclear support for the next 30 days is available. Enemy currently has 152mm Gun-Hows with nuclear rounds and SSMS which can del iver rounds of 10-50 kt yield within range of our division.

d. Recent and Present Significant Activities.

(1) Air reconnaissance and photo reports indicate increased enemy movement along axis Bravo to Limo. Movement indicates reinforcement of forward element of 4th CAA.

(2) Enemy's aerial recon and tactical air flights have increased in the last 36 hours, particularly along the I ine of contact.

(3) For the past 36 hours, volume of vehicular traffic has increased in southerly direction.

(4) Artillery fire from the enemy has become more intensive in the last 24 hours.

(5) Reliable source reports large tracked, amphibious vehicles mov ng into area vicinity Hill 805.

(Classification)

Figure A-4. Sample division intelligence estimate (continued).

(Classification)

(6) Enemy has begun to employ smoke along the forward slope of Hill 702.

e. Peculiarities and Weaknesses.

(1) Personnel. Enemy units are currently estimated to be at 85 to 90 percent authorized strength. Morale is high, although replacements may not be highly trained.

(2) Intelligence. Enemy stresses communications security and subordinate units of the 4th CAA have recently initiated intensive radio security and procedures training.

(3) Operations.

(a) Enemy is susceptible to mine warfare and antitank weapons.

(b) Enemy has trained heavily on attack formations and has been told offensive action is the only way to victory.

(c) Enemy is vulnerable to nuclear weapons due to massed forces and canalization by further advancement.

(4) Logistics. Supplies are adequate for the enemy's conduct of either the offense or defense. The enemy had previously stockpiled supplies wel l forward in division areas.

(5) Personal ities. GD Masonski, CG of the 10th MRD, is an advocate of penetration type offense on a narrow front with subsequent widening of the gaps to split enemy forces.

4. ENEMY CAPABILITIES.

a. Enumeration:

(1) Attack at any time along AA 1 with four MRBs and one tank battalion supported by normal d visional and regimental artillery groups.

(2) Attack at any time along AA 2 with four MRBs and one tank battalion supported by normal divisional and regimental artillery groups.

(Classification)

Figure A-4. Sample division intelligence estimate (continued).

(Classification)

(3) Defend at any time with forces in contact supported by all available divisional and regimental artillery groups.

(4) Reinforce the attack or defense with all or part of the following units at the places and times indicated:

	UNIT	PLACE	TIME
(a)	30th MRR(-)	A A 2	immediately
(b)	31st MRR(-)	AA 1	immediately
(c)	37th Tk Regt (-)	AA 1	immediately
(d)	27th MRR	AA 1 or 2	2 hr after start of movement
(e)	23d MRR	vic Little	8 hr after start of movement
(f)	121st Tk Regt	Unlocated	Unknown
(g)	U/l MRR of 19th MRD	vic Bravo	9 hr after start of movement

(5) Delay in successive positions to the east of Little.

(6) Employ chemical agents within our sector at any time.

(7) Employ nuclear weapons of a 0.5-50 kt yield with delivery by artillery or SSM.

(8) Employ guerrilla forces in our rear area either alone or in communication with the capabilities enumerated below.

(9) The enemy can attack our area with an undetermined number of fighter, ground attack, and bomb sorties daily. The maximum number of daily sorties mounted in our area has been 60.

(Classification)

Figure A-4. Sample division intelligence estimate (continued).

(Classification)

b. Analysis and Discussion.

(1) Attack along AA 1.

(a) The following indicate adoption of this capability:

1 Uses a good AA.

2 The enemy is massing mechanized elements, tanks, artillery and logistic support along this avenue.

3 Forward elements disposed on a relatively narrow front.

4 Extensive artillery preparation along approach.

(b) The scant cover presented along this AA is a limiting factor but does not preclude adoption of this capability.

(2) Attack along AA 2.

(a) The following indicate adoption of this capability:

1 The enemy is massing mechanized elements, tanks, artillery and logistic support along this avenue.

2 Forward elements disposed on a relatively narrow front.

3 Extensive artillery preparation along this avenue.

(b) The following indicate rejection of this capability:

1 This AA accommodates only one deployed regiment and offers limited cover and concealment.

2 The limited obstacle presented by Glenville.

(3) Defend. The following indicate rejection of this capability:

(a) The enemy is massing forces along the line of contact.

(b) Enemy has followed known doctrine for attack.

(Classification)

Figure A-4. Sampie division intelligence estimate (continued).

(Classification)

(c) Terrain favors attack.

(4) Reinforce. The following indicates adoption of this capability:

(a) Movement of additional troops toward the front.

(b) New units identified in the combat zone.

(c) Forward logistical buildup.

(5) Delay. There are no indications of the enemy's adoption of this capability.

(6) Employ chemical agents. There is no indication the enemy will employ chemical agents other than smoke.

(7) Employ nuclear weapons. There is no indication the enemy will employ nuclear weapons.

(8) Employ guerrilla forces. The following indicates adoption of this capability:

(a) Doctrine calls for use of guerrilla force.

(b) Use would enhance enemy advance by creating panic and confusion.

(9) Air attack. Indications are that enemy will continue to employ this capability as referenced in paragraph (9) above.

5. CONCLUSIONS.

a. Intelligence. Available intelligence indicates that the division can accomplish its mission. Intelligence supports adoption of the division course of action.

b. Weather and Terrain. The weather and terrain favors our defense. The beat defensive area is the high ground east of Dry Creek. The best AA into our defensive sector is AA 1.

c. Probable Enemy Courses of Action.

(Classification)

Figure A-4. Sample division intelligence estimate (continued).

(Classification)

(1) Attack with forces in contact supported by air and artillery with the main attack of one mechanized regiment along AA 1. Will reinforce w th elements as indicated in para 4a(4).

(2) Conduct secondary attack with forces in contact supported by air and arti llery with one mechanized regiment along AA 2.

(3) Employ guerrilla or special forces in our rear areas in conjunction with the above courses of action.

d. Enemy Vulnerabilities.

(1) The enemy is vulnerable to counterattack due to slowness to exploit potential penetrations.

(2) Vulnerable to nuclear attack due to massing of troops and concentrated logistics depots.

(3) Mine warfare will be effective against mechanized elements.

INTELLIGENCE ANNEX TO THE OPORD OR OPLAN

The intelligence annex disseminates information about enemy forces which is essential to the conduct of the operation and to give any other necessary intelligence orders or guidance for the operation(s) in question. It also serves as a medium for instructing subordinate commanders to acquire information necessary for the conduct of the operation but which can only be obtained immediately before or when the operation itself has begun. The intelligence annex is not a substitute for an intelligence collection plan; rather it is a way to communicate the taskings and requests of the collection plan.

The intelligence annex is a formal intelligence tasking document that accompanies an OPLAN or OPORD. It should be as brief as possible consistent with clarity. Its first paragraph is a summary of the enemy situation required to understand the OPLAN or OPORD and refers to annotated maps, enemy situation overlays, or current intelligence reports. Subsequent paragraphs contain specific collection requirements and instructions. SOP information should not be repeated in the intelligence annex. Figures A-6 and A-7 show a general intelligence annex format and division intelligence annex example.

ANNEX (INTELLIGENCE) to OPERATION ORDER NO _.
References: Maps, charts, and other relevant documents.
Time Zone Used Throughout the Order: Zulu

1. SUMMARY OF ENEMY SITUATION. Information about enemy forces essential in implementing the operation plan. When the amount of detail makes it appropriate, a brief summary and reference to the appropriate intelligence document, or appendix to the annex, may be used. Reference to documents not included in the annex should not be made when they ara not available to all recipients of the annex.

(Classification)

Figure A-6. Intelligence annex format.

(Classification)

2. INTELLIGENCE REQUIREMENTS. List each PIR in a separate subparagraph. If a priority has been assigned to the PIR list in order, so state. In a final subparagraph, list IRs, if any. If an intelligence annex is not prepared or is distributed separately from the basic order, PIR should be listed in the coordinating instructions subparagraph of the OPORD.

3. INTELLIGENCE ACQUISITION TASKS.

a. Orders to Subordinate and Attached Units. List, by unit, in separate numbered subparagraph, detailed instructions for reports required by the issuing headquarters. Units are listed in the same order as they are I isted in the OPORD.

b. Requests to Higher, Adjacent, and Cooperating Units. List in a separate numbered subparagraph requests for information from units not organic or attached.

4. MEASURES FOR HANDLING PERSONNEL, DOCUMENTS, AND MATERIEL. This paragraph contains instructions about the operation that are not contained in SOP or that modify or amplify SOP for the current operation. Examples include--

a. E P Ws, Deserters, Repatriates, Inhabitants, and Other Persons, Special handling and segregation instructions. Location of EPW collection point as provided by the provost marshal.

b. Captured Documents. Instructions for handling and processing of captured documents from time of capture to receipt by specified intelligence personnel .

c. Captured Materiel. Designation of items or categories of enemy materiel for examination, and specific instructions for their processing and disposition.

5. DOCUMENTS OR EQUIPMENT REQUIRED. This paragraph lists, in each category, the conditions under which certain documents or equipment required by or allocated to units can be obtained or requested. Items may include air photographs and maps.

6. COUNTERINTELLIGENCE.

a. This paragraph is covered largely by SOP. Many special operational instructions having Cl aspects are I isted in the OPORD or in other annexes.

(Classification)

Figure A-6. Intelligence annex format (continued).

(Classification)

b. Certain instructions and procedures on the conduct of special personnel in the operation may require limited dissemination on a need-to-know basis; therefore, a special CI measures appendix may be prepared for a limited and specified number of addresses.

7. REPORTS AND DISTRIBUTION. This paragraph may be covered largely by SOP. It stipulates the conditions (for example, dates, number of copies, issue) regulating the issue of intelligence reports to the originating command for the duration of the operation. Any or all of the following items may be covered in this paragraph:

a. Period to be covered by routine reports and distribution.

b. Routine and special reports that differ from SOP required from subordinate units.

c. Periodic or special conferences of inte lligence officers.

d. Distribution of special intelligence studies, such as defense overprints, photointelligence reports, and OB overlays.

em Special intelligence liaison, when indicated.

8. MISCELLANEOUS INSTRUCTIONS (if required). List here, under separate subparagraphs, necessary items that are not covered above or in SOPS, or which require action different from that detailed in SOPS.

13 All CB supply movement and dumping in zone.

14 The presence of enemy troops carrying protective masks or wearing protective clothing.

(b) As obtained--Negative reports by 1104OOZ September.

1 Movement on the following roads:

a North on Highway 25.

b West on Highway 2.

c West on Highway 4.

2 Activity in medium tank regiment (-) and tank battalion assembly area in vicinity of Burg.

3 Location and activity of mechanized regiment in vicinity of Burg.

4, Location and activity of mechanized regiment southwest of CR9944.

5 Locations of artillery positions, including number of weapons, caliber and state of preparation of positions.

6 Command posts, supply points, and medical facilities east of Highway 25.

(2) 18 Inf Div is requested to provide--

(a) As obtained--

1 Troop concentrations, including types of vehicles, east of Highway 25 within the divisional area of interest.

2 Instances of heavily guarded vehicular movement; special attention to Highway 2 from Zilch to Burg.

(Classification)

Figure A-7. Sample of a division intelligence annex (continued).

(Classification)

3 Areas under unusual security restrictions in the divisional area of interest.

4 Presence of special security troop units in any area east of Highway 25.

5 Any location in the divisional area of interest from which civilians have been evacuated.

6 Launcher sites for guided missiles or rockets within divisional area of interest.

7 Locations of heavy artillery positions, including number of weapons, caliber, and state of preparation of positions.

8 Preparation of emplacements suitable for, and presence of equipment appropriate to, atomic demolition munitions (ADM).

9 The interception of enemy patrols equipped for chemical biological (CB) activity.

10 All CB supply movement and dumping in zone.

11 The presence of enemy troops carrying protective masks or wearing protective clothing.

(b) As obtained--Negative reports by 1104OOZ September.

1 Movement on the following roads:

a North on Highway 25.

b West on Highway 2.

c West on Highway 4.

2 Location and activity of mechanized regiment in vicinity of Burg.

(3) 52 Mech Inf Div is requested to provide as obtained--

(a) Troop concentrations, including types of vehicles, east of Highway 25 within the divisional area of interest.

(Classification)

Figure A-7. Sample of a division intelligence annex (continued).

(Classification)

(b) Instances of heavily guarded vehicular movement, special attention to Highway 2 from Zilch to Burg.

(c) Areas under unusual security restrictions in the divisional area of interest.

(d) Presence of special security troop units in any area east of Highway 25.

(e) Any location in the divisional area of interest from which civilians have been evacuated.

(f) Launcher sites for guided missiles or rockets within divisional area of interest.

(g) Locations of heavy artillery positions, including number of weapons, caliber, and state of preparation of positions.

(h) Preparation of emplacements suitable for, and presence of equipment appropriate to, ADM.

(i) The interception of enemy patrols equipped for CB activity.

(j) All CB supply movement and dumping in zone.

(k) The presence of enemy troops carrying protective masks or wearing protective clothing.

(4) Supporting MI units provide information obtainable from SIGINT and ESM and will respond to specific tasking as described in separate instructions.

4. MEASURES FOR HANDLING PERSONNEL, DOCUMENTS, AND MATERIEL (see division SOP).

5. DOCUMENTS AND EQUIPMENT REQUIRED.

a. Maps. SOP distribution of map, Buttano, 1:50,000, Zelle-Pagt.

b. Photographic. Following aerial photographs will be furnished:

(Classification)

Figure A-7. Sample of a division intelligence annex (continued).

(Classification)

(1) Basic cover of division zone (1:10,000 approximate), six copies of each brigade and division artillery; one copy each tank battalion, mechanized infantry battalion, 1/21 Cav, division engineer, aviation battalion or group, and division signal officer.

(2) Annotated air photographs distributed automatically, as available.

6. COUNTERINTELLIGENCE.

a. Appendix 2, Cl.

b. All units coordinate use of Army aircraft through division tactical operations center (DTOC) to minimize number of aircraft in air over division zone prior to attack.

7. REPORTS AND DISTRIBUTION. Effective 1108OOZ September units will submit INTSUM at 0800, 1200, 1600, 2000, 2400, and 0400 hours daily in lieu of times prescribed in division SOP.

SITUATION REPORT

Preparation and submission of the SITREP is a staff responsibility of the S3; however, the S2 prepares paragraph 1, Enemy, of the SITREP and furnishes it to the S3 in usable form. Figure A-8 shows the prescribed format for preparing a SITREP.

ENEMY .

Committed forces (overlay).

Forces committed against TF 2-80 are--

(1) Four mechanized platoons.
(2) Two medium tank platoons.
(3) Normal regimental artillery.
(4) Six 160mm mortars.
(5) Ten 122mm howitzers.
(6) Four 100mm artillery guns self-propelled (SP).
(7) Two 122mm multiple rocket launchers.
(8) One 152mm gun SP.
(9) Air and nuclear weapons.

Reinforcements (overlay). Reinforcements currently capable of being" employed in sector now total: U/l Medium tk plt vic BD4156, MRC of 281st MRR vic BD4867, MRC of 282d MRR vic BD4873, MRC of 281st MRR vic AB4673, MRB (-) of 281st MRR vic AB4650, MRB of 282d MRR vic CD5060, U/l tk co vic DE5265 .

Enemy Activity During Period IOO6OOZ-1018OOZ.

(1) Occupation of previously unoccupied positions vic BG3531, NT3633, MT3734, DT4239 .
(2) Movement of combat units fwd vic MN4036.
(3) Dispersal of tanks to fwd units vic CG3136.
(4) Movement of assault boats into vic GM3338.
(5) Two 100mm AT guns (SP) vic MT3737, two 120mm AT guns (SP) vic ER3833 .
(6) Six additional 122mm how vic DT3731.
(7) Increased enemy counterbattery fire in bde sector.
(8) Clearing lanes through minefield BC2937.
(9) Mech regimental aid station vic CD3339.
(10) Increased enemy air activity vic FN2836, RB2437.
(11) Suspected jamming of VHF communications (intel net) at 100745Z and 013252.

Concl usions. Enemy's most probable courses of action--

(1) Continue defense now.
(2) Attack along our front within 8 hours.

Figure A-8. Sample situation report.

INTELLIGENCE REPORT

The INTREP is a standardized report which, based on its importance, is disseminated without regard to a specific schedule. It is prepared at all echelons when facts influencing the enemy capabilities have been observed, or when a change in enemy capabilities has taken place. It is passed to higher, lower, and adjacent units at the discretion of the commander producing the report. It is sent as quickly as possible following receipt of the information. Whenever time permits, the INTREP includes the originating office's interpretation of the information or intelligence being reported. The first word of the report is INTREP. Otherwise, there is no prescribed format for this report. It is not used in lieu of the critical INTREP. Figure A-9 shows a message format for INTREPs that has been developed for joint operations.

C110: Message Identification Number.

INTREP: The first word of the report must be "INTREP."

HEADING: Addressee information and meg ctr data.

TEXT: Intelligence or information to be reported. Should answer Who, What, Where, When and How Questions.

CONCLUSIONS: Whenever possible the INTREP should include the originating office's interpretation of the information intelligence being reported.

Figure A-9. Sample INTREP message format.

INTSUM (Number) FOR PERIOD ENDING DATE-TIME GROUP-MONTH-YEAR

BODY

1. SUMMARY OF ENEMY ACTIVITY FOR THE PERIOD. Is a summary of those that occurred during the period of the report. It contains but not be limited to the following:

a. GROUND ACTIVITY. Summarize major movements and activities of enemy ground forces. Indicate estimated strength, composition, disposition, and any other items of significance.

b. TRACE OF FORWARD ELEMENTS. The most forward location or main location of the enemy force will be shown as a pinpoint position, area boundary, or a series of connected points, as applicable. The following methods for reporting locations is used and stated in the intelligence annex.

Figure A-12. Intelligence summary for joint service operations.

(1) Operations Involving Ground Forces. For unified or joint operations in which ground forces are directly participating, not specifically provided for in the subparagraph below, the UTM system prescribed for the area concerned is used to the maximum extent practicable in communications between ground forces and other forces jointly engaged. When the use of the UTM system is impractical, latitude and longitude is used.

(2) Operations Not Involving Ground Forces, The World Geographic Reference System (GEOREF) is used in joint operations which do not directly involve ground forces.

(3) For Close Air Support of Ground Forces. When air forces (including naval aviation) are acting in close air support of ground forces, the UTM system prescribed for use by ground forces in the area concerned is used.

(4) For Joint Amphibious Operations. The UTM system prescribed for use by landing forces within the amphibious objective area is used for support of landing force operations by all supporting forces.

(5) For Joint Air Defense Operations. GEOREF is used in joint air defense operations. When there is a possibility of confusing which system to use in reporting positions, the reference system should be indicated in the report. GEOREF is not used by air forces (including naval aviation) when reporting positions to ground forces, except in air defense operations. GEOREF is used by ground forces when reporting positions to air forces in air defense operations.

(6) in joint operations not using procedures specified in the above paragraphs, latitude and longitude is used.

c. POTENTIAL TARGETS FOR NUCLEAR WEAPONS. List all potential nuclear targets, such as concentrations of troops or equipment observed during period. Include location, date, and time (Zulu) of observation.

d. NUCLEAR ACTIVITY. Enemy nuclear capability observed during the period is reported. Include any changes to previously reported capabilities. Indicate location, date, and time (Zulu) of observation of artillery, missile, or air nuclear capability.

e. NUCLEAR, BIOLOGICAL, AND CHEMICAL ACTIVITY. Indicate NBC weapons (agents) employed or capability by type, location, date, and time (Zulu) of occurrence.

f. AIR ACTIVITY. All enemy air activity that has occurred during the period (CAS, air interdiction, AD, and reconnaissance affecting the

Figure A-12. Intelligence summary for joint service operations (continued).

operation is summarized, including location, date and time (Zulu), and type of aircraft involved.

g. NAVAL ACTIVITY. Summarize all enemy naval activity that has occurred during the period. include location, date and time (Zulu), and types of ships and craft.

h. OTHER. New tactics observed are summarized. Cl measures of significance, including active and passive measures, are listed. Any item not properly reported in any other paragraph also may be included.

2. ENEMY PERSONNEL AND EQUIPMENT LOSSES.

a. PERSONNEL. List in separate categories confirmed KI A (body count) , estimated KIA, estimated wounded in act on (WIA), and captured.

b. EQUIPMENT AND MATERIEL. List by number and type the enemy equipment and materiel losses during the period. Include damaged enemy equipment separately.

3. NEW OBSTACLES AND BARRIERS. List those identified during the period by type and location.

4. ADMINISTRATIVE ACTIVITIES. Summarize enemy activities pertaining to personnel replacements, supply buildup, or other unusual logistic activity but not information or intelligence reported elsewhere in the INTSUM.

5. NEW IDENTIFICATIONS.

a. UNITS. List new units identified during the period. Include location, date and time (Zulu), and unit making the identification.

b. PERSONALITIES. List significant individuals identified during the period by name, rank or title, and organization.

6. ENEMY MOVEMENTS. Summarize significant enemy movements by type, activity, location, and unit designation, if known.

7. ESTIMATED NUMBER AND TYPES OF VEHICLES, SHIPS, AIRCRAFT. Summarize by type the estimated number of vehicles, ships, and aircraft available to the enemy.

8. WEATHER AND TERRAIN CONDITIONS. A summary of the weather and terrain conditions during the period that would have an effect on subsequent operations.

Figure A-12. Intelligence summary for joint service operations (continued).

9. BRIEF DESCRIPTION OF GAPABILITIES AND VULNERABILITIES. (Always included.) State courses of action which the enemy most probably will adopt.

NOTE: Paragraphs and subparagraphs for which no information has been obtained are omitted in the preparation of the INTSUM. Each topic reported upon retains the numerical (and letter) designation outlined above.

Figure A-12. Intelligence summary for joint service operations (continued).

PERIODIC INTELLIGENCE REPORT

The PERINTREP is a summary of the intelligence situation covering a longer period than the INTSUM. It is a means of disseminating detailed information and intelligence. Other intelligence documents like technical intelligence summaries, EPW interrogation reports, translations of captured documents, and weather and climate summaries are disseminated as appendixes to the PERINTREP. The PERINTREP is concise--but complete--and makes maximum use of sketches, overlays, marked maps, and annexes.

Although not normally prepared by intelligence officers at division and lower levels, PERINTREPs provide detailed information and intelligence. Therefore, intelligence officers at these levels should be familiar with the format and content of PERINTREPs.

The PERINTREP is normally published every 24 hours. The beginning and end of the period is selected to permit dissemination of the PERINTREP in time for its use in daily planning. It is disseminated by the most suitable means consistent with its volume and urgency. Figure A-13 shows the PERINTREP format.

The Supplementary Intelligence Report (SUPINTREP) is a comprehensive analysis of one or more specific subjects. This report is formatted like a PERINTREP and usually contains selected intelligence data collected over an extended period of time. It includes additional details on items contained in other reports. The report is disseminated based on the intelligence contained in the report and the desires of the commander. It is normally produced as the result of a request or in support of a particular operation.

1. GENERAL ENEMY SITUATION. This paragraph contains a brief summary of enemy operations during the period. Amplifying details are furnished in the paragraphs that follow and in appropriate annexes, or both. This paragraph provides brief highlights of the anemy situation and the significance of the enemy's major activities, to include marked changes in morale, strengths, dispositions, tactics, combat effectiveness, and equipment. Data that is langthy or can conveniently be shown graphically are presented in annexes.

2. ENEMY ACTIVITIES. This paragraph, in conjunction with those following, providas the details of the situation summarized in paragraph 1. Detailed intelligence provided in this paragraph covers all operational activities. Information may be presented graphically by overlays, printed maps, sketch maps, and annexes. Subparagraphs are omitted when appropriate intelligence is not available or is adequately covered by othar portions of this report.

a. Ground. (Primarily includes activities of combat arms, raserves, and reinforcements; also includes enemy defensas, minefield, fortifications, barriers, obstacles, and other defensive works.)

b. Air. (Includes Air Force activities, such as bombing, close air support, tactical aerial reconnaissance, air surveillance, and air-supported operations.)

c. Airborne.

d. Irregular.

e. NBC operations.

f. EW.

(Classification)

Figure A-13. Sample format for a periodic intelligence report.

g. Other. (Normally includes other than combat arms; includes appropriate comments not covered in other subparagraphs on reserves, reinforcements, new tactics, weapons and equipment, administrative installations, combat service support, and technical intelligence.)

3. ORDER OF BATTLE, Frequently, this paragraph will consist only of references to the enemy SITMAP (or overlay) and to the OB annex, which is developed using the format shown below. When desired by the commander, particularly significant 06 changes may be summarized in addition to being discussed in detail in the 06 annex.

a. Composition and Disposition.

b. Strength. (Personnel and major weapons and items of equipment.)

(1) Losses.

(2) Current strength.

c. Tactics,

d. Training.

e. Css.

f. Combat Effectiveness.

g. Miscellaneous Data.

4. COUNTERINTELLIGENCE. This paragraph, or parts thereof, should be issued as an annex if a limited distribution is required.

a. General. (A short summary of the CI situation during the period.)

b. Espionage.

c. Sabotage.

d. Subversion.

e. Communication and Noncommunication Security.

f. Miscellaneous.

5. WEATHER. This paragraph gives a summary of the effect of weather on operations during the period.

(Classification)

Figure A-13. Sample format for a period intelligence report (continued).

(Classification)

6. TERRAIN. Use an annex, special maps, and overlays, when possible. Include impact on future operations, if appropriate.

7. ANALYSIS AND DISCUSSION. This paragraph lists and discusses briefly enemy capabilities and vulnerabilities. The conclusions present the commander's assessment of the most probable courses of action available to the enemy, probability of their adoption, and vulnerabilities that are exploitable by own, higher, or lower levels of command.

a. Enemy Capabilities.

b. Enemy Vulnerabilities.

c. Conclusions.

Authentication:

Annexes: (Any intelligence document may be distributed as an annex to a PERINTREP. Although annexes are a means of distributing detailed intelligence and information, care is exercised to avoid unnecessary bulk and duplication.)

DISTRIBUTION:

(Classification)

Figure A-13. Sample format for a periodic intelligence report (continued).

PERIODIC INTELLIGENCE SUMMARY

The periodic intelligence summary (PERINTSUM) is a detailed hard copy summary of the intelligence situation covering a period of time specified by the force commander (normally 24 hours or more). The PERINTSUM is a means of disseminating concise and complete detailed information and intelligence and makes maximum use of sketches, overlays, annotated maps, and annexes. Normally, this report is prepared at corps level and higher. It is disseminated two echelons higher, two echelons lower, and to adjacent units; however, subordinate units also may be tasked to prepare a PERINTSUM. Figure A-14 shows a JCS message format for the PERINTSUM, structured to facilitate updating the intelligence estimate.

PERINT SUM (Number) FOR PERIOD ENDING DATE-TIME GROUP-MONTH-YEAR

BODY

1. AREA OF OPERATIONS. State conditions which exist and indicate the effect of these conditions on enemy capabilities and the assigned mission. The characteristics of the area are based on the facts and conclusions of an analysis of the AO, as follows:

a. TOPOGRAPHY. Include information available on observation and fields of fire, concealment and cover, obstacles, key terrain features, AAs, nuclear fires, biological and chemical agents, and so forth. Graphic representation may be included, if necessary.

b. HYDROGRAPHY. Include general relief of beaches and beach approaches, surf conditions, tides and currents, navigational aids, identifying features, channels, water depths, rocks and shoals, obstacles, anchorages, beach trafficability, coastline, contiguous islands, and compartmentation, as each affects operations.

c. CLIMATE AND WEATHER. Discuss weather during the period which will affect operations.

d. TRANSPORTATION . Include status of beaches, beach airways, pipelines, and inland waterways. The following should be included: capacities, surface conditions, bridges, amount and condition of rolling stock, motor and air transport, barges, freighters, and other inland waterways craft. Vulnerabilities are reported in as much detail as possible.

e. ELECTRONICS AND TELECOMMUNICATIONS, Report existing electronic telecommunications systems and equipment, both military and civil.

f. POLITICS, The extent of civil control of the region, the amenability of the civilian population to political control, the political organizations, and the key political figures.

Figure A-14. Sample periodic intelligence summary.

g. ECONOMICS. Include only that specific economic information which may be necessary for conduct of the current operation.

h. SOCIOLOGY. The sociological factors dealing with customs, characterist its, religions, the minority or dissident groups, and the allegiance of the population.

i. SCIENCE AND TECHNOLOGY. Scientific and technical information on enemy weapons, equipment, and techniques as wel l as the employment of new capabilities during the course of the operations.

2. ENEMY OPERATIONS DURING THE PERIOD.

a. GROUND FORCES.

(1) Strength and Dispositions. (By overlay, if possible.) Summary of enemy units and locations.

(2) Committed Forces. Report those enemy ground units, including guerrillas, together with their supporting ground fire units which are within the AO.

(3) Reinforcements. Include the designation and location of reinforcements which may or may not be employed.

(4) Activity. (Discuss by arm of service.) Include a description of all significant enemy movements which may affect the friendly mission.

(5) Other Order of Battle Factors. Reference may be made to overlays, enemy SITMAPS, or previously published documents.

(6) New Tactics, Weapons, and Equipment. List new tactics and equipment which may affect the mission and enemy capabilities.

(7) Nuclear-Capable Artillery and Launchers. Describe the operational capability to launch missiles by numbers and types of missiles; guidance systems; ranges; types of warheads; type of launching sites (if fixed, whether hardened or not); and for mobile launchers state mobility, rate of fire, and readiness.

(8) Nuclear, Biological, and Nuclear Activity. These weapons should be reported by type, yield, number, method of delivery or application, and enemy doctrine' concerning their use.

b. AIR FORCES.

(1) Strength and Dispositions. Summary of enemy units and locations.

(2) Order of Battle. Summary of opposing forces and other enemy forces that can affect accomplishment of mission.

Figure A-14. Sample periodic intelligence summary (continued).

(3) New Tactics, Weapons, and Equipment. List new tactics, weapons, and equipment which may affect the mission and enemy capabilities.

c. NAVAL FORCES (Including amphibious forces).

(1) Strength and Dispositions. Summary of enemy units and locations.

(2) Order of Battle. Summary of opposing forces and other enemy forces that can affect accomplishment of mission.

(3) New Tactics, Weapons, and Equipment. List new tactics, weapons, and equipment which may affect the mission and enemy capabilities.

d. MISSILE FORCES (Excluding SAMs).

(1) Strength and Dispositions. Summary of enemy units and locations.

(2) Order of Battle. Summary of opposing forces and other enemy forces that can affect accomplishment of mission.

(3) New Tactics, Weapons, and Equipment. List new tactics, weapons, and equipment which may affect the mission and enemy capabilities.

e. ANTIAIRCRAFT DEFENSES (including SAM).

(1) Strength and Dispositions. Summary of enemy units and locations.

(2) Order of Battle. Summary of opposing forces and other enemy forces that can affect accomplishment of mission.

(3) New Tactics, Weapons, and Equipment. List new tactics, weapons, and equipment which may affect the mission and enemy capabilities.

f. AIRBORNE UNITS.

(1) Strength and Dispositions. Summary of enemy units and locations.

(2) Order of Battle. Summary of opposing forces and other enemy forces that can affect accomplishment of mission.

Figure A-14. Sample periodic intelligence summary (continued).

(3) New Tactics Weapons, and Equipment. List new tactics, weapons, and equipment which may affect the mission and enemy capabilities.

3.. ENEMY MILITARY SITUATION.

a. IDENTIFICATION OF COMMITTED GROUND FORCES.

(1) Movement and Locations. Report disposition, location, and echelon of control of enemy ground forces.

(2) Reinforcements. Report disposition, location, and echelon of control of enemy ground force reinforcements.

(3) Logistics. Report the following elements of the enemy's logistic system: transportation, storage distribution, levels of supply, critical shortages.

(4) Equipment. Report weapons systems and equipment used by committed enemy ground forces.

(5) Personalities. Report significant individuals operating for the enemy ground forces.

(6) Morale. Report any significant breakdown or buildup of enemy norale.

(7) Personnel and Materiel Losses.

(a) KIA.

1 Body count.

2 Estimates.

(b) WIA (estimated).

(c) Captured.

(d) Materiel losses.

(8) Analysis of Capabilities. Analyze each capability of enemy-committed ground forces, considering all applicable factors in item 3a above.

Figure A-14. Sample periodic intelligence summary (continued).

b. IDENTIFICATION OF AIR FORCES.

(1) Operational Capability (aircraft and airfields). Report observed aircraft operational capability, including numbers of aircraft, fuel status, weapons, and status of the airfield.

(2) Movements and Locations. Report movements and locations of all observed aircraft and airfields,

(3) Materiel and Personnel Losses,

(a) Aircraft.

1 Confirmed destroyed in the air.

2 Confirmed destroyed on the ground,

3 Confirmed damaged in the air.

4 Confirmed damaged on the ground.

5 Probable destroyed.

6 Probable damaged.

(b) Ground equipment.

1 Destroyed.

2 Damaged.

(c) Personnel.

1 KIA.

a Confirmed.

b Estimated.

2 WIA (estimated).

3 Captured.

(4) Morale. Report any significant breakdown or buildup of enemy morale.

(5) Electronic Warfare Capability. Report enemy ECM, ECCM, and ESM capabilities and activities.

Figure A-14. Sample periodic intelligence summary (continued).

(6) Nuclear Capability. Report nuclear weapons observed, including type, yield, numbers, method of del ivery, and enemy doctrine concerning their use.

(7) Analysis of Capabilities. Analyze each capability of enemy air forces, considering all applicable factors in item 3b above.

c. IDENTIFICATION OF NAVAL FORCES.

(1) Operational Capability. Report observed naval forces' operational capability, including numbers of ships, operational weapons, and problems which could affect their successful employment.

(2) Movements and Locations. Report movement and location of all observed naval forces.

(3) Ships, Materiel, and Personnel Losses.

(a) Ships (identification by name, class, type).

1 Confirmed sunk.

2 Probable sunk.

3 Damaged.

(b) Shore-based equipment and facilities.

1 Destroyed.

2 Damaged.

(c) Personnel .

1 KIA.

a Confirmed.

b Estimated.

2 WIA (estimated).

3 Captured.

(4) Morale. Report any significant breakdown or buildup of enemy morale.

(5) Electronic Warfare Capability. Report enemy ECM, ECCM, and ESM capabilities and activities.

Figure A-14. Sample periodic intelligence summary (continued).

(6) Analysis of Capabilities. Analyze each capability of enemy naval forces, considering all applicable factors in item 3c above,

4. ENEMY UNCONVENTIONAL AND PSYCHOLOGICAL WARFARE.

a. IDENTIFICATION OF GUERRILLA FORCES. Identify guerrilla forces being used in friendly areas or areas newly seized from the enemy.

b. PSYCHOLOGICAL WARFARE. Discuss psychological warfare, including enemy methods and facilities observed for the conduct of propaganda, the susceptibility of the population of the target area, and the major or main focus of the enemy's psychological warfare efforts.

5. COUNTERINTELLIGENCE.

a. SABOTAGE. Report enemy sabotage effects observed, including information concerning his methods, targets, sensitive targets in the AO, and successes or fai lures.

b. ESPIONAGE. Report enemy efforts to collect information by types of espionage: designation (trained agents) or saturation (mass use of citizenry) and include methods of pressure, coercion, and enforcing the saturation-type espionage.

6. CONCLUSIONS. State conclusions derived from item 3 above, and include, when possible, a concise statement of the effects of each enemy capability on the accomplishment of the assigned mission. Cite enemy vulnerabilities, where possible.

Figure A-14. Sample periodic intelligence summary (continued).

RECONNAISSANCE EXPLOITATION REPORT

The RECCEXREP disseminates results obtained from the first rapid interpretation of imagery and debriefing of the aircrew. The report addresses those targets requested in the original tasking with each target addressed separately. The RECCEXREP is submitted as rapidly as possible, but not later than 45 minutes after engine shutdown. If review of the imagery results in information contradictory to that in an earl ier RECCEXREP, the new information is to be reported promptly in another RECCEXREP. Table A-1 shows an annotated format for the RECCEXREP.

Table A-1. Sample reconnassance exploitation report annotated format.

Standard Message Heading	Standard Message Heading
RECCEXREP	RECCEXREP
Air Reconnaissance Mission Number:	2/R/501
A. Location identifier:	A. PB088195
B. Time on target; time of sighting.	B. 24161OZ
C. Results:	C. CAT 06 1. Type: Motor rifle and tank. 2. Status: Moving northwest on road from Rotterode to Asbach. 3. Activity: 24xT-62, 9xBMP. 4. Defenses: 2xZSU-23-4 moving with and defending target.
D. Other information	D. None.
1. TARWI:	1. TARWI 1234X
2. Imagery confirmed:	2. Yes
E. *Type sensor, exposures:	E. Good, large
F. *Percentage of coverage:	F. 100 percent.

* To be completed if significant or requested.

NOTE: Target category codes are found in STANAG 3596. Standard message headings are noted in AR 105-31. The RECCEXREP replaces the hot (high priority) photographic report (HOTPHOTOREP) and mission report (MISREP) (except that the MISREP is used for negative mission results) in USAREUR. It may soon be accepted for use by US forces worldwide.

INITIAL AND SUPPLEMENTAL PROGRAMMED INTERPRETATION REPORT

The initial programed interpretation report (IPIR) and the supplemental programmed interpretation report (SUPIR) are used to report intelligence obtained from imagery which has not been reported through previous reports. The format for both reports is the same and should be used to report data acquired from a systematic review of imagery or to report more detailed information than is provided in other reports. These reports are prepared in either manual or ADP formats.

The IPIR is no t completed on all missions and must be requested. It is disseminated w thin four hours of engine shut-down. The IPIR reports on programed miss on objectives or other vital intelligence information which is readily dentified in reasonable proximity to these objectives and which has not been reported in earlier reports.

The SUPIR reports on all significant targets covered by the mission and not included in other reports or when supplemental information is required. The SUPIR is completed at higher headquarters only if they decide it is necessary.

Table A-2 shows the format used for both the IPIR and the SUPIR. This format also is used for joint service operations.

Table A-2. Initiai and supplemental programmed interpretation reports.

Standard Message Heading IPIR (or SUPIR)	Standard Message Heading IPIR
Air Task or Mission Number:	2/R/501
PART I: Mission highlights:	PART I: One new SA-2 site observed

A. Collector's objectives satisfied:	A. NTR
B. Collector's objectives not satisfied:	B. CAT 4/PB1437/241653Z/ camera malfunction.

(When issued separately from an OPORD)

INTERROGATION AND TRANSLATION REPORTS

Interrogation reports summarize the results of interrogations of EPW, civil ian detainees, or refugees, and the translations of summaries of enemy documents. Information of immediate value is disseminated in spot reports.

The initial interrogation report serves as a written summary of the initial interrogation of each prisoner. Figure A-15 shows the format of this report. Emphasis is placed on completing as much of the tactical interrogation as possible at the lowest level and supplementing this with further interrogation at higher echelons. The primary purpose of this report is to preclude duplication of effort in subsequent interrogations.

The detailed interrogation report is used to record information obtained in the course of subsequent interrogations of selected interrogees. Figure A-16 shows its format. A more detailed interrogation and screening report format is available in FM 34-52.

During joint service operations, interrogation information of immediate tactical interest (obtained at the brigade or regimental level) is generally reported in the INTREP. Follow-on interrogation reports, the initial interrogation report, and the detailed interrogation report disseminate more complete and comprehensive information. It is essential that these follow-on reports reference the INTREP where the information first appeared to ensure that the information contained in these reports is not used to confirm the preliminary information contained in the INTREP.

Joint services use the document translation report to report information gained through the translation of documents which contain information of tactical value. Figures A-17 and A-18 show the format and sample of a translation report. Full or extract translations are accomplished as the intelligence officer directs. All translations are prepared in triplicate, unless otherwise directed, and each translation is conspicuously annotated with the word "Draft.'"

The original of the translation is appended to the document when it is forwarded to the next higher headquarters. Copies of the original document are provided to the intelligence officers at echelons which contain translation sections to support their journal entries. The document translation report format also is used for joint service operations. Figures A-19 and A-20 show sample screening reports. Figures A-21 and A-22 show sample tactical interrogation reports. These reports are used to record information on interrogees.

PART 2. TEXT OF TRANSLATION

My dear Serzhen'ka:

It has been a long time since I received a letter from you. How are and where are you? The last time you wrote that fighting was going on around you all the time, and this worries me a lot. Take care of yourself. There have been many changes at home. Your mother, despite her age, had to go to work in the factory. They make tanks there, but the sign over the entrance says this is a sugar plant. I don't know why they do this. At the school where I work, we were also told to go and work at the same plant. They are going to close the school. Everyone has either to go to the front or work in the war industry. This is necessary in order to speed up the victory over the enemy of our country. I would be more at ease if I knew that you are alive and well. Please write as soon as you can.

Your KATHY.

Figure A-22. Sample completed tactical interrogation report (continued).

BOMBING. SHELLING. AND MORTARING REPORTS

Bombing reports (BOMREPS), shell reports (SHELREPs), and mortar bombing reports (MORTREPs) supply information on enemy bombing, shelling, or mortaring activity. Submission is the responsibility of the affected unit. Reports are handled as normal messages and are transmitted by the fastest means available. Each transmission is preceded by the code word "SHELREP" in the case of enemy artillery, by the code word "MORTREP" in the case of enemy mortar or rocket fire, and by the code word "BOMREP" in the case of an enemy air attack. The text of the message is transmitted in the clear except for the unit identification and position of the observer. A call sign is used in place of unit identification. The observer's position is encoded if it discloses the location of a headquarters or an important OP. Figure A-23 shows the bombing, shell ing, and mortaring report format.

(CLASSIFICATION)

A. UNIT OF ORIGIN. (use current call sign, address group or code name) .

B. POSITION OF OBSERVER (grid reference preferred--encode if this discloses the location of a headquarters or important OP, or if subparagraph F2, below, is used to give information on location).

c. DIRECT}ON AND ANGLE OF FALL OR DESCENT. (direction and bearing of flash, sound, or groove of shell (state which) is measured clockwise from grld north in mils, unless otherwise specified, The angle of fall or descent may be determined by placing a stick or rod in the fuze tunnel and measuring in roils, Unless otherwise specified, the angle formed by the stick or rod in relation to the horizontal plane).

D. TIME FROM.

E. TIME TO.

F. AREA BOMBED, SHELLED, ROCKETED, OR MORTARED. (may be sent either as--

1. Grid reference (clear reference is to be used).

OR

2. Direction measures clockwise from grid north to impact points (degrees or rnils--state which) and distance in yards or meters (state which) from observer. This information must be encoded. When this method is used, maximum possible accuracy is essential) .

G. NUMBER AND NATURE OF GUNS, MORTARS, ROCKET LAUNCHERS, AIRCRAFT, OR OTHER METHODS OF DELIVERY.

H. NATURE OF FIRE. (adjustment, bombardment, harassing) (may be omitted for aircraft) .

1. NUMBER, TYPE AND CALIBER. (state whether measured or assumed) of shells, rockets (or missi!es) , and bombs.

J. TIME FROM FLASH TO BANG. (omit for aircraft).

F. DAMAGE . (encode if required).

NOTE: JCS Publication 12, page 14, requires an additional message indicator item. This item identifies the report being sent as a shell, bomb, or mortar report. It generally follows the unit of origin item in the message format.

(CLASSIFICATION)

Figure A-23. Format for BOMREP, SHELREP, or MORTREP reports.

NBC ATTACK REPORTS

NBC attack report formats are used according to the provisions of STANAGS 2103 and 2104 and FM 3-3 to report NBC attacks and the resulting NBC hazardous areas. Chemical and radiological hazardous areas resulting from nuclear and chemical attack by friendly forces are also reported using these formats. These reports are--

- NBC-1. Report used by the observing unit to give initial and subsequent data of an enemy chemical, biological, or nuclear attack.
- NBC-2. Report used for passing evaluated data of a chemical, biological, or nuclear attack.
- NBC-3. Report used for immediate warning of expected NBC contamination or hazardous area.
- NBC-4. Report used for radiation dose-rate measurements and detection of chemical or biological contamination.
- NBC-5. Report used to locate the area of NBC contamination or hazard.
- NBC-6. Report used to detail information on chemical or biological attacks.

NBC-1 and -4 reports are prepared by the unit under attack or a unit observing an attack. These reports are submitted through cormmand, intelligence, or FA communications channels to the designated headquarters TOC by the fastest means available. Initial enemy use of NBC weapons is always reported to the theater commander, through the chain of command, by the fastest means with a FLASH message precedence.

The information source for nuclear attack reports is normally the headquarters of an FA or AD unit (other units may also be designated as collection and reporting agencies). These units submit--

- An initial NBC-1 nuclear report to the unit's next higher headquarters with a FLASH message precedence.
- Subsequent NBC-1 nuclear reports, which are transmitted to the unit's next higher headquarters, with an IMMEDIATE message precedence, giving follow-up data.

The information source for chemical and biological attack reports is normally the headquarters of a company or independent platoon. It submits--

- An initial NBC-1 chemical or biological report, to its next higher headquarters, with a FLASH message precedence. The next higher headquarters forwards the initial NBC-1 chemical or biological report through command channels, to the NBC collection center, with the same message precedence.

- Subsequent NBC-1 chemical or biological reports, to the unit's next higher headquarters, with an IMMEDIATE message precedence, giving follow-up data. The next higher headquarters forwards subsequent NBC-1 chemical or biological reports through command channels, to the NBC collection center, with the same message precedence.

NBC COLLECTION CENTER

The NBC collection center is normally the nuclear, biological, and chemical element (NBCE) of the TOC at division. It consolidates NBC-1 nuclear, biological, or chemical reports of the same attack received from its various information sources and transmits an NBC-1 report to the NBC control center, normally the TOC at field army headquarters. It transmits appropriate NBC-2, -3, and -5 reports to subordinate, adjacent, and higher commands. If there is no NBCE, the G3 assumes these responsibilities.

NBC CONTROL CENTER

The NBC control center is normally the NBCE of the tactical operations center at field army. It consolidates and evaluates NBC reports received from subordinate commands and USAF, Marine Corps, and civilian installations and agencies. It directs reconnaissance and survey efforts; transmits evaluated NBC data to subordinate commands and adjacent area commands; and submits appropriate reports to higher headquarters, adjacent commands, and national agencies. If there is no NBCE, the G3 assumes these responsibilities.

NBC-1 REPORTS

NBC-1 reports follow the same format as SHELLREPs, MORTREPS, and BOMBREPs. The words "Type of Report," and the letters "B," "'D," "'H," or either "C or "F" always are reported. Other items are optional. Table A-3 shows the letter explanation for NBC-1 reports. Table A-21 shows the master list of available letters.

(CLASSIFICATION)

The NBC-5 report is most useful when sent as a map trace or overlay (if time and distance permit). When the contamination arises from a single threat or unidentified nuclear burst, the dose-rate always refers to H+1 hour, and the letter "'T" is used. When there have been several nuclear detonations at different times or on different days and no single H+1 hour is possible, the dose rates are reported as a specified item using the letter "'O." Letters "O" and "T" are, therefore, alternatives; both cannot be used in the same report. Table A-19 explains the letter designations used in NBC-5 reports.

NOTE: When requested decay rates are to be transmitted, use the letter "R. "

Table A-19. Letter explanation for NBC-5 reports.

s. Date-time contamination initially detected (chemical or biological (local or Zulu time, state which)		S. 200800 (local)

Table A-19. Letter explanation for NBC-5 reports (continued).

T.	H+1 date-time or date-time of latest reconnaissance of contamination in the area (chemical or biological). State whether local or Zulu time.	T. 201505 ZULU	T. 201045 (local)
u.	1,000 cGy/hr contour I ine coordinates		
v.	300 cGy/hr contour line coordinates	V. ND 651455 ND 810510 ND 821459 ND 651455	
w.	100 cGy/hr contour line coordinates	W. ND 604718 ND 991686 ND 114420 ND 595007	
x.	20 cGy/hr contour line coordinates, or located area of contaminant ion (chemical or biological)		X. CHEMICAL ND 206991 ND 201575 ND 200787 ND 206991

Figure A-24 shows a current example of the estimated radiological contamination trace (dose-rate type) format. It is not necessary, or even desirable, to report all four of the contours for different dose rates. Four are given to provide flexibility. (In the example, only two are reported.) When a contour closes to form a complete ring, the first coordinate is reported at the end. The following are colors used for plotting and sending the report as a trace:

- Red for 1 ,000 cGy/hr.
- Green for 300 cGy/hr.
- Blue for 100 cGy/hr.
- Black for 20 cGy/hr,

Yellow is used for chemical and biological contamination or hazardous areas. Additional letters, including those shown in the examples in Table A-19, are used. Letters from the master list in Table A-21 are added at the users' discretion.

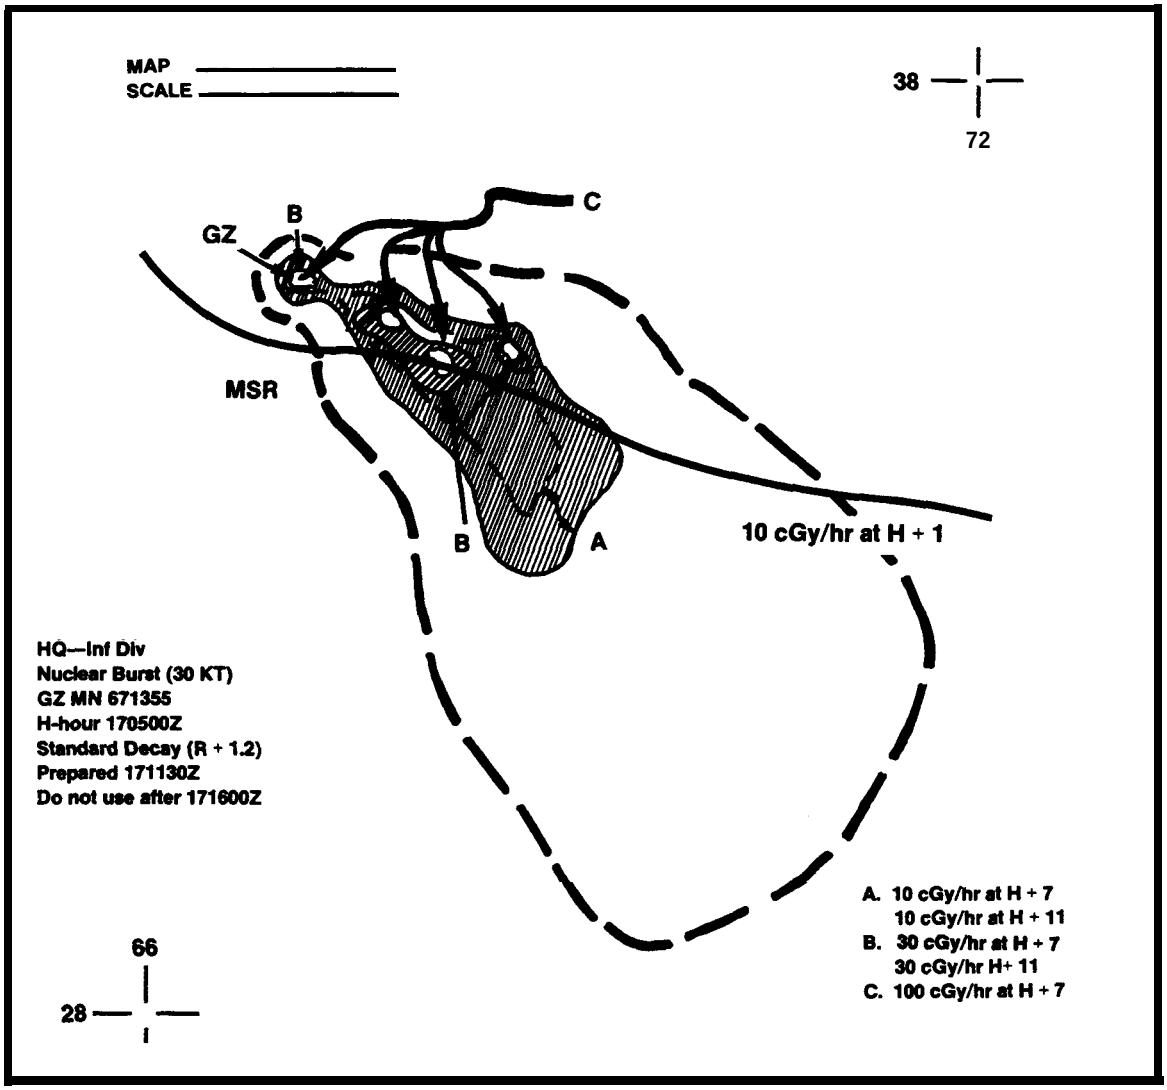

Figure A-24. Radiological contamination trace.

NBC-6 REPORT

NBC-6 reports are used to summarize information concerning a chemical or biolog ical attack. Table A-20 shows an NBC-6 biological report.

Table A-20. NBC-6 biological report.

ALFA	coo l
DELTA	200430Z
ECHO	200435Z
FOXTROT	LBZO0300 to LB208304 Actual
GOLF	Aerial spray
HOTEL	Toxin
INDIA	2 Aircraft
KILO	Rolling hills, mostly open
MIKE	Enemy broke contact just before the attack, then bypassed on right f l ank
QUEBEC	Soil sample taken at LB200300
YANKEE	Downwind direction 270 degrees, wind speed 015 kph
ZULU BRAVO	This is the only biological attack in our area

The NBC-6 report is a narrative description of chemical and biological attacks that have occurred in a unit's AO. It is designed to be developed at battalion level and above. It contains as much information as is known about the attacks. It is submitted only when requested and is usually sent in hard copy.

MASTER LIST

Table A-21 shows the master list of letters that is applicable to all types of NBC reports. Each letter is annotated. Care should be taken to ensure that letters mandatory for each NBC report are incorporated before adding letters to the reports, overlays, or traces.

Table A-21. Master list of letters.

LETTER	MEANING	MEANING
	NUCLEAR REPORTS	CHEMICAL OR BIOLOGICAL REPORTS
A.	Strike serial number(s).	Strike serial number(s).
B.	Position of observer (UTM or place) .	position of observer (UTM) or place) .
c.	Direction measured clockwise from grid or magnetic north (state which) of the attack from observer (degrees or roils, state which).	Direction measured clockwise from grid or magnetic north (state which) of the attack from observer (degrees or roils, state which) .
D.	Date-time of detonation (local or Zulu time, state which) . If local time is used, give the letter of the local time zone, if-known. See FM 101-10-1 for time-zone charts. If the local time is used and the time-zone letter is not known, the word "local" will be transmitted with this item.	Date-time attack started (!ocal or Zulu time, state which). If local time is used, give the letter of the local time zone, if known. See FM 101-10-1 for time-zone charts. If the local time is used and the time-zone letter is not known, the word '"local, " will be transmitted with this item.
E.	Illumination time. (Report only when other data are not available. Report in seconds.)	Time attack ended (local or Zulu, state which).
F.	Location of attack (UTM or place) (actual or estimated, state which).	Area attacked (actual or estimated, state which).
G.	Means of delivery, if known.	Means of delivery, if known.
H.	Type of burst--air, surface, or unknown, state which-- including height, if known.	Type of agent, if known (chemical or biological). Type of attack (chemical or biological).
1.	(This letter item is not used for nuclear report.)	Type and number of munitions or aircraft (state which).
J.	Flash-to-bang time (seconds).	
K.	Crater present or absent and diameter, if known (meters) .	

Table A-21. Master list of letters (continued).

LETTER	MEANING	MEANING
	NUCLEAR REPORTS	CHEMICAL OR BIOLOGICAL REPORTS
L.	Nuclear burst angular cloud width measured at 5 minutes after the detonation (degrees or roils, state which). (Do not report if data is obtained more than 5 minutes after the detonation.)	
M.	Stabilized cloud-top angle and cloud-bottom angle (state which) or cloud-top height and cloud-bottom height (state which) measured at H+1O minutes (degrees, roils, meters, or feet--state which).	
N.	Estimated yield (kt).	
0.	Reference date-time for estimated contours when not H+l hour.	
P.	For radar purposes only:	Area of expected contamination (UTM).
P.A.	UTM coordinates of points to outline external contours of radioactive clouds.	
P.B.	Effective wind direction (direction from which the wind is blowing) in degrees or roils (state which).	
Q.	Location of reading (UTM).	
R.	Dose-rate (cGy/hr). The words "initial," "increasing,"' "peak." or "decreasing" may be added.	
s.	Date-time of reading (local or Zulu time, state which).	Date-time contamination initially detected (local or Zulu time, state which).
T.	H+l date-time (local or Zulu time, state which).	Date-time of latest reconnaissance of contamination in the area (local or Zulu time, state which).
u.	1,000 cGy/hr contour line coordinates (UTM) (red).	
v.	300 cGy/hr contour line coordinates (UTM) (green).	

Table A-21. Master list of letters (continued).

LETTER	MEANING	MEANING
	NUCLEAR REPORTS	CHEMICAL OR BIOLOGICAL REPORTS
W.	100 cGy/hr contour line coordinates (UTM) (blue).	
x.	20 cGy/hr contour line coordinates (UTM) (black).	Located area of contamination (UTM) (yellow).
Y.	Direction measured clockwise from grid north to the left and then to the right radial lines (degrees or roils, state which--4 digits each).	
z.	Effective windspeed (kph), 3 digits; downwind distance of zone I (km), 3 digits; cloud radius (km), 2 digits. (When effective windspeed is less than 8 kph, the NBC-3 report will contain only three significant digits, that is, the radial distance of zone I.)	

ANALYSIS OF AREA OF OPERATIONS

Figure A-25 shows a completed sample and explanation of analysis of the area of operations. The following paragraphs are keyed to paragraphs in the sample.

1. **PURPOSE AND LIMITING CONSIDERATIONS.** State the purpose of the analysis and define the area that is being analyzed. Include a statement of the mission of the command and other considerations that limit the applicability of the analysis. Include the commander's plan of action and enemy capabilities.

2. **GENERAL DESCRIPTION OF THE AREA.**

a. Climatic or Weather Conditions. This paragraph lists items of weather information that have military significance. Throughout the remainder of the analysis, weather information is interpreted as to its operational effects. For example, winds at low temperatures are interpreted in terms of the wind chill factor and the resulting effects on operations, such as attack or defense which must face the prevailing winds, or the use of open or closed storage facilities.

Light data is always reported to assist in selecting courses of action and the conduct of mil itary activities.

The BMNT and the EENT are the beginning and end, respectively, of enough light for limited visibility. The BMCT and the EECT are the beginning and end, respectively, of adequate light for large-scale operations.

Moon phases and other phenomena, like atmospheric conditions and star brilliance, also influence night operations. During full moonlight, conditions of visibility sometimes approach those of daylight. Such conditions need to be anticipated as they influence friendly and enemy courses of action such as attacks, patrolling, and changes in dispositions.

b. Terrain.

(1) Relief and Drainage System, Drainage and ridge lines are basic elements in studying terrain, as they clearly indicate the general shape of the ground. A complete study of relief and drainage includes detailed information about slope, configuration, elevation of ground forms; and depth, width, tide data, and conditions of banks and bottoms of streams and rivers. These items are portrayed graphically on maps.

(2) Vegetation. Vegetation studies are best presented in the form of tinted, or otherwise marked, overlays. Considerations include locations of trees, diameters of trunks, density, ground cover or canopy, undergrowth, and types of natural and cultivated vegetation in nonwooded areas.

(3) Surface Materials. Surface materials are best presented on colored or marked overlays. Soil maps made by the agricultural services of various countries are particularly valuable. The information contained in soil maps frequently is translated into a trafficability map and a map of areas susceptible to high levels of induced radioactivity. A trafficability map based on weather forecasts are colored or marked to indicate degrees of trafficability effectively shows areas suitable for cross-country movement.

(4) Artificial Features, Artificial features of potential military significance include roads, railroads, bridges, tunnels, mines, towns, industrial areas, and fortifications. The features are best represented on maps or marked overlays.

c. Additional Characteristics. Only those characteristics--sociology, politics, economics, transportation, manpower--which influence the choice of a course of action by either force are included. Lengthy data is presented in an annex, preferably in tabular form.

3. MILITARY ASPECTS OF THE AREA. The facts listed in paragraph 2 are analyzed and their influence on tactical and CSS factors that are considered in the selection of a course of action by either force are determined. In the analysis of these factors, the effects of and on nuclear fires, chemical and biological agents, and important devices and equipment used in implementing courses of action are integrated, as appropriate. The tactical aspects of observation and fire, concealment and cover, obstacles, key terrain features, AAs, and the CSS aspects are discussed in the following paragraphs.

a. Tactical Aspects.

(1) Observation and Fire.

(a) Observation depends on conditions of terrain which permit a force to locate the enemy, either visually or through the use of surveillance devices. The highest terrain in an area usually provides the best observation. The increased use of equipment with LOS characteristics requires the availability of suitable terrain features for sighting purposes; while at same time, the capability of employing organic aerial platforms reduces the requirement to use such terrain. Dust clouds caused by nuclear blast reduce electronic LOS. Other limits to observation include darkness and tall vegetation (woods and jungle canopy). The effects of visibility on observation are analyzed along with weather conditions.

(b) Fire, as used in the analysis of the battlefield area, includes the FofFs of all weapons and characteristics of weapons del ivery systems affected by weather and terrain. For example, gusty surface winds affect the use of projectiles. High, irregular terrain features or the absence of overhead mass clearance limit FofFs. A FofF is an area that weapons can cover effectively with fire from given positions. Although observation is essential to effective control of fire, the best observation does not always guarantee the best FofF. An ideal FofF for flat-trajectory weapons is an open area in which the enemy can both be seen and has no protection weapons fire.

(2) Concealment and Cover.

(a) Concealment is protection from observation. It is provided by woods, underbrush, snowdrifts, tall grass, cultivated vegetation, darkness, smoke, dust, fog, ground haze, rain, or falling snow.

(b) Cover is protection from the effects of direct and indirect fires. It is provided by ditches, quarries, caves, riverbanks, folds in the ground, shell craters, buildings, walls, railroad embankments and cuts, sunken roads, and highway fills. Defiladed areas which provide protection against some types of weapons do not necessarily protect against effects of nuclear fires. Unless the forward slopes of a terrain mass are very steep, nuclear blast will affect personnel and material on the reverse slope because the blast wave follows the configuration of all but the most rugged terrain. When a nuclear weapon is fired over a deep val ley, or the valley axis points toward ground zero, the blast effects are canal ized, increasing the damage. Irregular terrain provides some cover from thermal radiation of nuclear fires. Few buildings are sufficiently strong to withstand all effects of blast or, if not damaged or destroyed by blast, to be unaffected by thermal radiation. Foxholes, bunkers, and tunnel-type shelters offer the simplest forms of effective cover.

(c) Concealment and cover are desirable for both the attack and the defense. If troops move forward under the concealment of woods, fog, or a moonless night, the chances of achieving surprise are greater. If troops move protected from the enemy's fire by ditches, embankments, or walls, the attack is more effective. In a defensive situation, friendly forces seek to defend in an area which offers both concealment and cover but does not provide covered approaches for the enemy.

(d) The mobility of the command is considered in determining avai lable concealment and cover. Concealment and cover are desirable during troop movements by any means. Routes which afford good concealment and cover reduce the vulnerability of a moving force to detection and to destruction by fire.

(3) Obstacles.

(a) An obstacle is any natural or artificial terrain feature which stops, impedes, or diverts military movement. Natural obstacles include rivers, streams, canals, lakes, swamps, cliffs, steep slopes, dense woods, jungles, deserts, mountains, cities, and certain types of unstable soil . Artificial obstacles are works of construction and destruction executed to stop or impede military movement. They include minefield, craters, antitank ditches, trenches, abatises, roadblocks, deliberately flooded areas, areas contaminated with chemical and biological agents, extensive rubble, forest fires, trees blown down, and areas contaminated with residual nuclear radiation.

(b) To be fully effective, obstacles are covered by observation and fire. However, even undefended obstacles may canal ize an attacker into concentrations which are easier to detect and which are suitable for nuclear attack. Obstacles perpendicular to a direction of attack favor the defender by slowing the enemy, forcing the enemy into concentrations that tend to occur while crossing obstacles, and holding the attacker for a longer time under the effective fires of the defense. Obstacles parallel to an axis of advance give the attacker flank protection. However, parallel obstacles interfere with lateral movement and coordination.

(c) The mission of the command influences consideration of obstacles. In the defense, the intelligence officer identifies as obstacles those features of the terrain which stop, impede, or divert military movement into, out of, or within the area encompassed by the FEBA, lateral boundaries, and the rear boundary (prescribed or assumed). In the attack, the intelligence officer considers the obstacles from the line of departure to the objective (both inclusive), bounded laterally by the assigned or assumed operational zone.

(4) Key Terrain Features.

(a) A key terrain feature is any locality or area whose seizure or control affords a marked advantage to either opposing force. Key terrain features are selected to indicate areas and localities whose seizure or control are considered in formulating and selecting courses of action. The selection is based on the level of command, type of unit, and mission of the command. Key terrain which would give us a marked advantage in the accomplishment of our mission is selected. If it is seized or controlled by the enemy, it would delay the accomplishment of our mission. For example, a bridge over an unfoldable river gives access to the opposite shore without requiring an assault crossing, Control of a road or rail center reduces the enemy's ability to resist our advance. A level clearing in rough terrain is the only accessible landing field for airmobile operations.

(b) Key terrain varies with the level of command. For example, to an army commander, a large city affords marked advantages as a communications center. To a division commander, the high ground which dominates the city is more important, and the city itself is an obstacle,

(c) Obstacles are rarely key terrain features. The high ground dominating a river, rather than the river itself, is usually the key terrain feature for the lower unit commander. An exception is an obstacle like a built-up area, which is assigned as an objective to a force; the obstacle then becomes key terrain to the force ordered to capture it.

(d) Key terrain, in addition to influencing mission accomplishment, is also highly significant in applying combat power. Control is not ensured only by seizure and occupation. Seizure and physical occupancy of key terrain features by relatively large forces may not be desirable, Destructive fires delivered by long-range means can destroy forces physically occupying key terrain. The commander controls key terrain to avoid destruction of force while keeping the enemy from gaining control. Control includes maneuver, surveillance, security, and use of fires. Terrain which permits or denies maneuver is key terrain. Tactical use of terrain often is directed at increasing the capability for applying combat power and, at the same time, forcing the enemy into areas which result in reduction of the enemy's abil ity to apply combat power. Terrain which permits this also is key terrain. The effects of terrain on maneuver, appl ication of combat power, and preservation of force integrity are considerations in selecting and controlling key terrain and its tactical use.

(e) In the offense, key terrain features are usually forward of the friendly dispositions and are often assigned as objectives. However, terrain features in adjacent sectors are key terrain if their control is necessary for the continuation of the attack or the accomplishment of the mission. If the mission is to destroy enemy forces, terrain is selected whose seizure helps ensure the required destruction. Terrain which gives the enemy effective observation along an axis of advance to be used by the friendly forces is key terrain if the enemy must be denied its possession or control. Key terrain is within friendly territory when its control is essential to the success of an offensive operation. For example, if the enemy attacks before friendly forces attack, the control of this terrain is essential because it affords a marked advantage. Thus, it is a key terrain feature.

In the defense, key terrain is usually within the assigned sector and within or behind the selected defensive area. Some examples of key terrain are--

- Terrain which gives good observation over AAs to and into the defensive position.
- Terrain which permits the defender to cover an obstacle by fire.

- Important communication centers which affect command communications and the use of reserves.

Key terrain also is forward of the defensive area or in adjacent sectors. For example, a terrain feature along the FLOT or in an adjacent sector which gives the enemy good observation over defended localities, corrrnunication routes, or enemy AAs is key terrain when active measures are taken to reduce the enemy advantage. The defender moves positions forward to include the feature or take action to minimize the enemy advantage by the use of fire, chemicals, smoke, concealment, and cover.

(5) Avenues of Approach. An AA is a route for a force of a particular size to reach an objective or key terrain. To be considered an AA, a route provides some ease of movement and enough width for dispersion of a force of a sufficient size to significantly affect the outcome of the operation. The division G2 usually considers AAs adequate for the type brigade of the particular division. The corps and higher G2s usually consider AAs adequate for at least a division. In determining the width of dispersion, consideration is given to the deployment patterns, mobi I ity means, and area required for maneuver to prevent presenting lucrative targets for nuclear fires.

(a) Ground Avenues of Approach. A valley approach gives the advancing force some cover from enemy direct fire and some concealment from enemy observation. A valley approach includes the floor of the valley, the slopes of the ridges, and the military crests. Control of the military crests on each side of the valley is essential. In a valley approach, the best AA is that which offers the best observation, cross-country trafficability, road net, FofF, concealment and cover, and dispersion, In evaluating the use of deep valley approach, the possible intensification of nuclear effects and resulting greater casualties on the valley floor are considered. At times, the best avenue is along the slopes of a ridge below the military crests, rather than along the valley floor.

The use of a ridge approach depends upon the width and shape of the ridge, the size and deployment of the units involved, and the distance to the elevation of adjacent ridges. A ridge approach usually has the advantage of good observation; however, there is little protection from enemy fire on the ridge. The best AA on a ridge is often slightly below the topographical crest, with sufficient force on the crest to control it.

(b) Air Avenues of Approach. An AAA is a route which provides a suitable path for a particular number of aircraft to reach a LZ. The aviation officer or the aviation mission commander assists in evaluating the effect of density altitude, wind, turbulence, and visibility on selected AAAs. In selecting AAAs, the following factors are considered:

- Sufficient air space.

- Concealment from ground observation.

° Eaaily recognized terrain features.

°Length of flight paths.

1 Sufficient air space is required for rapid movement of the aircraft to the LZS. FS requirements involving artillery and tactical air support may restrict the availability of air space. Consideration is given to gun-target lines and to restrictive fire plans that are in effect during the air movement phase. The size of the air assault force involved in the operation also is considered; however, no paramsters are given as to width concerning AAA. Depending on the flight formation, a large number of helicopters are flown over a relatively narrow AAA. Another consideration in relation to adequate air space is the desirability of having multiple flight routes available. Generally, in situations with concentrated enemy forces along the LOC, multiple flight routes from the pickup zone to the objective area and back are desirable.

2 Heavily forested and swamp areas provide good routes and concealment from ground level because ground troops have little opportunity to see and fire on helicopters passing overhead at tree-top level. Low-altitude operations over heavy foliage distort the acoustic wave from aircraft and decrease the distance at which the sound is detected. They also hamper determination of the direction of the noise source by ground observers. AAAs are in defi lade with respect to enemy AD radar and weapon locations. Ridge lines are crossed as infrequently as possible to reduce exposure time to radar detection. Steep defiles or canyons are avoided, especially when there ie an appreciable amount of surface wind that can cause momentary loss of aircraft control because of downdrafts.

3 Navigation at low altitudes is extremely difficult. The presence of easily recognized terrain features, such as rivers or roads, significantly improves the pilot's abil ity to navigate by reference to ground features. Terrain corridors are usually desirable because they afford both ease of navigation and defilade. Linear features that parallel the direction of flight are the most valuable in assisting navigation.

4 In the interest of minimizing the exposure of aircraft enroute to the objective area, the shortest possible flight paths that afford sufficient air space, concealment from ground observation, and easily recognized terrain features are usually preferred. However, longer flight paths are selected for purposes of deception.

(6) Combat Service Support Aspects. The analyses of the facts and subconclusions developed in the preceding parts of the analysis are used as a basis for further studies of the effects of CSS activities on friendly and enemy units. This paragraph determines the effects of the characteristics of the battlefield area on CSS that influence the selection of a course of action by either force.

In studying the influence of the area, consideration is given to effects cm matters such as availability of adequate routes for LOC, facilities for maintenance and storage, construction resources, public health situation, required shelter for administrative facilities, availability of labor, maintenance of discipline, law and order, and control of refugees.

4. EFFECTS OF CHARACTERISTICS OF THE AREA. This paragraph contains the conclusions reached on the basis of the facts and subconclusions previously developed. The effects of the characteristics of the AO on each significant course of action which the enemy is physically oapable of adopting and which, if adopted, could adversely affect the accomplishment of our mission are discussed. Usually, the discussion includes effects on the enemy's ability to defend or attack. It also includes, as appropriate, the effects on the enemy's ability to delay; to use reserves, amphibious or airborne forces, nuclear fires, guerrilla forces, chemical and biological agents, cover and deception, sensor devices; or to conduct special operations and support the enemy's forces administratively. The discussion of the effects on our courses of action is limited to those required for the accomplishment of the mission.

ANALYSIS OF AREA OF OPERATIONS NO 6
eference: Map, series CSM 01, Westland, sheet 1 (Ebel), edition 1974, 1:50,000

. PURPOSE AND LIMITING CONSIDERATIONS

a. Purpose. To analyze and evaluate the area east of Cartersberg (9297) from the general area of verlook Ridge (9406) south to the Erie Canal within the division zone.

b. Mission. Division attacks 140900 July, secures high ground from Hill 322 (1394) to Hill 305 (0490) o deny the enemy a bridgehead, and prepares to cross the Erie Canal and continue the attack to the south.

:. GENERAL DESCRIPTION OF THE AREA

a. Climate or Weather Conditions.

(1) Climate, Annex A (climatic summary).

(2) Weather, Weather forecast, 12-16 July.

(a) Precipitation. None predicted.

(b) Fog. None predicted.

(c) Temperature. Range from 70° to 86°F.

(d) Wind. Surface winds from north, 9 to 17 knots per hour.

(e) Cloudiness. None predicted.

(f) Atmospheric pressure. Average about 980 millibars.

(g) Moon. New moon, 25 July.

(h) Light data.

Date	BMNT	BMCT	EECT	EENT	Moonrise	Moonset
13 July	0232	0440	1933	2138	2024	0608
14 July	0233	0442	1932	2138	2050	0714
15 July	0234	0444	1931	2137	2114	0806
16 July	0235	0446	1930	2137	2137	0901

b. Terrain.

(1) Relief and drainage systems. Annex B (Relief Overlay), Annex C (Drainage Overlay), and Annex D (Slope Overlay). Area is drained by the Maine River on the west and southwest and the South River on the northeast. The northwest to southeast ridge running from Hill 351 (9807) to Albany (3960) generally bisects the area. The major spurs of this ridge run generally east and west. The terrain is generally rolling with a series of sharply, rising table lands. The Maine and South Rivers and the Erie Canal are unfordable. The Maine River south of Cartersberg averages about 30 meters in width and 2 meters in depth. The South River averages about 15 meters in width and about 2 meters in depth. The Erie Canal has steep banks and averages about 3 meters in depth and is about 17 to 21 meters in width at the top of the banks. All other rivers and streams are fordable, varying in width from about 1 to 7 meters, with an average depth of 40 centimeters.

(2) Vegetation. Annex E (Vegetation Overlay) and Annex F (Vegetation Impeding Movement Overlay). Vegetation consists of growing crops, vineyards, pasturelands, orchards, and wooded areas. Hay, wheat, and vegetables are the main crops. Most crops are completely cut by the end of September. Wheat is grown mostly on open-topped tablelands. Vineyards are generally terraced and on the slopes of hills. Most woods in the

Figure A-25. Example and explanation of analysis of the AO.

C I ass if i cat ion is centered at the top and bottom of each page,

Copy number assignad by issuing headquarters. Official designation of unit. Physical I ocat ion of command post by coordinates, state or county.

Date-time roup when the analysis is signed followed by the message reference number (example: SB2) used when the analy sis is distributed outside the adquarters for the purpose of acknowledgment in the clear. All appended material analysis having the suns distribution bears the sane reference number.

The title line identifies the analyses by number (consecutive throughout the calendar year).

Reference I ist maps, charts, or other documents requ i red to understand the analy s is. References to maps inc I ude the map series number (country or geograph ic area, if required), sheet number (and name, if required, edition and scale (if required).

Paragraph 1a states the exact I imi ts of the area being studied.

Paragraph 1b states the mission and any other I imi t ing considerat ions such as t ime limitations, the commander's plan of action, and enemy capabilities.

Paragraph 2 is listing of pertinent facts for use as a basis for the succeeding paragraphs.

Paragraph 2a lists or refers to other docunments containing (for the period under study) meteorlogical conditions to, include precipitation, fog, cloud conditions, temperature, relative humidity, surface winds, effective winds (or winds aloft), atmospheric pressure, I ight data to inc lude moon phases, moonrise and moonset, and other geodetic data as appropriate. When appropriate, include magnetic phenomena.

Paragraph 2a(2) I ists data to be considered by aviation units. It is used in calculating aircraft performance and altimeter setting. Light data are always given, as they are necessary for the set ect ion of courses of action. The BMNT and the EENT are the be inning and end, respectively, of enough I ight for limited visibi I ity. The BMCT and the EECT are the beginning and end, respectively of adequate light for large scale operat ions.

Paragraph 2b(l) describes conf igurat ion of the ground, including slopes, for personnel and vehicles and critical relief for equipmnt dependent on configuration and conditions of streams, including depth, slope, and condition of banks and bottom, and location of crossing sites. Named localities are located by grid coordinates the first time they appear in the anal ysis. Grid coordinates are repeated only if requ i red for ease of reference.

Paragraph 2b(l) also makes maximum use of special colored maps or overlays. Under each characteristic include facts to assist in subsequent determination of the effects of the character ist i c on the use of nuc l ear weapons, chemical agents, and important devices and equipment used implement ing courses of action (do not include here the interpretation of these effect on friendly or enemy possible courses of action).

Paragraph 2b(2) indicates wooded areas, including type, location, size, and shape of trees, diameter of trunks, density, crown cover, and undergrowth include types of natural and cultivated vegatation of norwooded areas.

(CLASSIFICATION)

area are deciduous trees about 25 centimeters in diameter and approximately 10 to 12 meters apart. Underbrush has been cleared throughout the area. Logging operations throughout the forest in vicinity of 9306 have thinned the tree stand to an average density of 90 trees per hectare. Roads and streambanks are generally bordered with trees. Small, scattered patches of trees are found in the lowland plains. Wooded areas restrict, but do not preclude, the employment of armor.

(3) Surface materials. Annex G (Soils Overlays). Surface in most of the area consists of thick clay-like soil on a hard limestone or limey shale base. Above 200 meters elevation, with but few exceptions, the soil is firm and capable of supporting heavy wheeled and tracked vehicles even where under cultivation. The rains do not seriously affect trafficability at this time of year. The soil is generally wet in stream bottoms and in the lowlands below 200 meters elevation. While capable of supporting light tracked or wheeled vehicles, the soil becomes spongy and boggy where the turf has been destroyed.

(4) Artificial features. Annex H (Built-up Areas and LOC Overlay). A double-track railroad crosses the area from Cartersberg to the east. A single-track railroad runs from Nome (9619) to Cartersberg, crossing the Macon saddle (9608). A double-track railroad from the west parallels the south bank of the Erie Canal as far as Dawson (0489). The area is covered with an extensive network of principal and secondary roads. Principal roads radiate from Cartersberg. Roads across Overlook Ridge (9406) from north to south have been improved. National highways are at least 6 meters wide. All bridges on regularly maintained roads are two-way class 50. Villages consist of closely grouped buildings of brick or stone. The enemy has constructed extensive field fortifications and artificial obstacles throughout the area north of Erie Canal. The artificial obstacles consist primarily of minefields and wire and are most extensive in the South River valley and in the general area of Athens (0194) and Auburn (0495).

c. Other Characteristics.

(1) Sociology. The area is generally rural. The farm villages have a present population of from 50 to 100 each. Current population of Cartersberg is estimated at 50,000 and population of Harlow is estimated at 15,000. The population is primarily Caucasian; farming is the principal occupation. Principal crops are wheat, corn, cotton, and grapes.

(2) Economics. Little food and few supplies are available because the enemy has taken food and materials to support the forces. However, some grain crops remain in fields and can be harvested at a later date if protected.

(3) Government. There are civil agencies that are prepared to take over functions of civil government as the country is recaptured.

(4) Psychology. The confiscation of food and supplies and the impressing of civilian labor have made the people extremely hostile toward the enemy. Acts of sabotage occur frequently in the Army's rear area.

3. MILITARY ASPECTS OF THE AREA.

a. Tactical Aspects.

(1) Observation and fire. Annex I (Horizontal Visibility Overlay).

(a) Weather conditions. Annex J (Fog Overlay). Weather permits good air and ground observation. Continued dry weather will increase dust clouds caused by nuclear weapons. Observation will be reduced for a longer period of time in nuclear target areas. Weather favors our, but not enemy's, use of smoke.

(b) Relief. The high ground now held by the enemy affords the enemy excellent observation over approaches into the position. The enemy-held hills west of the Maine River dominate the western part of the area. High ground vicinity Balda's Peak (0004) provides the enemy with excellent observation to the northeast, east, and south. The division objective, with the spur extending north from 1395 to 1004, provides the enemy with excellent observation over all approaches leading directly to it. FofFs within the area for flat-trajectory weapons are generally good but short, except in valley bottoms and from the military crests of open hilltops where they are generally excellent. FofFs on the northern slopes of Overlook Ridge and Hill 351 are excellent and favor enemy defense. FofFs from the northern slopes of the division objective are excellent. Long-range FofFs to the south from Overlook Ridge are good and favor our attack. FofFs for high-angle weapons are good throughout the area.

(CLASSIFICATION)

Figure A-25. Example and explanation of analysis of the AO (continued).

Paragraph *2b(3)* indicates the type and distribution of soils and subsoils in the area and soil trafficability. Include soil content as it affects induced radiation, Use overlay if material is extensive.

Paragraph 2b(4) indicates roads, railroads, bridges, tunnels, mines, towns, industial areas, fortifications, and other features of military significance; include type of construction.

Paragraph 2c (1), (2) consider as pert inent in separate subparagraphs sociology, pol i t ics, economics, psychology, and other character i st ics. Other character i st ics may i nc l ude such items as sc ience, mater iel, transportat i on, manpower, hydrography , etc. Under each of these characteristics considered, list all facts as the pertain to the area of study and which may influence friendly and enemy courses of action. The degree of coverage required of these characteristics varied with the mission and other aspects of the operat ional env iroment. These characteristics influence, to some extent, the decisions of all commanders and become increasingly important as the area of interest of a command increases.

Paragraph 3 anal yzea the facts in the previous paragraph to determine their influence on factors affecting tactical and activities that are considered in the development of specific courses of action. The axtent of the analysis depends on the mission, the means available to accomplish the mission, and the possible means the enemy can use to prevent the accomplishment of the mission. {n considering the factors under each aspect, include the affects, as appropriate, of and on nuclear fires, chemical and enemy biological agents, and important devices and equipment used in implement ing courses of action.

Paragraph 3a considers the effect that the .aerea will have on observation, fire, concealment and obstacles; and deterimines key tarrain features and AAs.

Paragraph 3a(1) indicates graphically or describes the influence of weather, relief, vegetation, surface materials, artifical features, and other pertinent characteristics. Effects of and on nuclear fires, chemical agents, and so forth are included as are any marked effects on surveillance devices equipment based on LOS and fire delivery means. Effects on fire include effects on delivery means, FofFs and effectiveness of fires. Observation and fire are of concern to CSS units as they influence rear area security.

(CLASSIFICATION)

(c) Vegetation. The National Forest from 0306 to 0597 severely restricts observation and FofFs in the eastern part of the area. Within all wooded areas FofFs for flat-trajectory weapons are restricted to forest trails and roads. Fields and tree blowdown in woods, caused by nuclear weapons, may restrict FofFs within woods. Wheat fields severely restrict ground level observation at this time of the year. Forest fire smoke clouds may reduce observation throughout the area.

(d) Artificial features. Church steeples in the numerous villages afford excellent observation points. Villages and farm buildings will limit FofFs for flat-trajectory weapons.

(2) Concealment and cover.

(a) Relief. The rolling nature of the terrain affords some degree of concealment and cover from ground observation. Concealment and cover are poor on the northern slopes of Overlook Ridge and Hill 351. On the southern slopes of Overlook Ridge, concealment and cover are good. The rolling nature of the terrain and numerous folds in the ground will reduce thermal affects of nuclear bursts.

(b) Vegetation. Annex K (Canopy Closure Overlay). National Forest offers excellent concealment and cover for large units. Woods throughout the area afford excellent concealment and protection from thermal effects because of the thick deciduous trees being in full leaf. Wheatfields also afford some degre of concealment.

(c) Artificial features. Buildings in the area offer cover from small arms fire and shell fragments, but do not protect from blast by any significant degree.

(3) Obstacles. Annex L (Combined Obstacles Overlay).

(a) Relief. Terrain favors enemy use of persistent chemicals in the valley forward of the present position. Drainage system consists of the Maine and South Rivers.

(b) Vegetation. Woods, especially the National Forest, will restrict the cross-country mobility of all vehicles, including tracklaying vehicles. They will become severe obstacles in the event of blowdown by blast or if set afire. Cultivated areas will limit wheeled vehicles. Terraced vineyards on the south slopes of Overlook Ridge, Baird's Peak, and the plateau at 9400 northeast of Cartersberg will restrict the movements of tanks and heavy vehicles to road and trails in those areas.

(c) Surface materials. Annex M (Weather Effects on Cross Country Movement Overlay). The soil is generally wet in areas below 299 meters elevation. This will magnify the cratering effects of subsurface nuclear bursts in these locations. While capable of supporting light tracked or wheeled vehicles, the soil becomes spongy and boggy where the turf has been destroyed. Soil composition does not favor the production of high intensities or radio activity.

(d) Artificial features. The enemy has constructed extensive artificial obstacles consisting of minefields and wire, particularly on the east flank and north of Hill 305 (0490). This will hinder movements and limit use of certain AAs in these areas. Buildings and villages do not present significant obstacles even if destroyed by blast, except for the suburbs of Cartersberg on the east bank of the Maine River.

(4) Key Terrain Features.

(a) Hill 351 (9807) and Overlook Ridge west thereof. These terrain features control the AAs in the western and central parts of our zone. The mission will be seriously jeopardized if these areas are not secured.

(b) Hill 359 (0004). This hill mass dominates the central and eastern AAs. Its seizure is essential to the integrity and security of our forces, and will facilitate fire and maneuver to the south.

(c) Hill 334 (9400). This plateau controls the AAs in the western part of the division zone. It is key terrain if our tactical plans call for either a main attack or a supporting attack in the area.

(d) Hill 306 (9997). This hill provides dominant observation over a wide area in this part of the division zone. Its seizure and control will greatly enhance the security, fire, and maneuver of any our forces attacking in this area.

(CLASSIFICATION)

Figure A-25. Example and explanation of analysis of the AO (continued).

Paragraph 3a(2) on concealment and cover, indicates or describes the influence of weather, relief, vegetation, and artifical features. Effects of and on nuclear fires, surveillance devices, chemical and enemy biological agents, and so forth are included as appropriate. The discussion is oriented not only on protection of own and enemy forces, but also on other operations to include use of guerrillas, infiltration and counter infiltration, deception, CI, armor, and artillery. It is also oriented on site requirement for CSS and tactical installations. Include only marked effects that help in selection of friendly and enemy courses of action.

Paragraph 3a(3) on obstacles indicates graphically or describes all natural and artificial obstacles and the influence of relief, weather, vegetation, surface materials, and artifical features. Effects, as appropriate, of and on nuclear fires, chemical and enemy biological agents, and effects on trafficability and accessibility are included. If of significant influence, the effect of each obstacle on possible friendly and enemy courses of action is indicated. Obstacles and trafficability influence site locations for CSS units.

Paragraph 3a(4) describes key terrain features based on the analysis of observations and fire, concealment and cover, obstacles, and mission. Any locality or area the seizure, retention, or control of which affords a marked advantage of either force is considered. The influence of each key terrain feature listed is discussed briefly. The discussion is oriented toward subsequent development of friendly and enemy courses of action. Key terrain features selected are revised as required by the commander's decision and current situation. Key terrain features may be omitted when the enemy has no capability to secure or control terrain features that will materially affect the accomplishment of the mission.

(CLASSIFICATION)

(e) Hill 326 (1199), This hill dominates favorable terrain leading directly to tha eastarn part of the division object ive.

(f) Hi I Is 305 (0490) and 322 (1394). This terrain system constitutes the division objective. 'he mission cannot beaccompl ishad without securing it. Control of this ridge is also necessary to ontinuat ion of the attack to the south,

(5) Avenues of Approach. Annax N (Avenues of Approach Overlay).

(a) Available to enemy into our position.

1. Axis Hill 351 (9607)-Hill 361 (9709),
2. Axis Hill 339 (9206)-Hill 356 (9310).
3. Axis Hill 230 (0010)-Paris (9811)-Hill 364 (9613).

(b) Available to us into the enemy's position.

1. Axis Hill 356 (9310)-Hill 339 (9206)-Hill 334 (9400)-Hill 306 (9997)-Hill 305 (0490)-r idgs east thereof (Avenue A).

2. Axis Hi II 361 (9709)-Hi I I 351 (9607)-Hi I I 359 (0004)-Auburn (0495)-ridge Hi I I 305 (0490) to Hi I I 322 (1394) (Avenue B).

3. Axis Hill 361 (9709)-Hill 351 (9807)-Hill 359 (0004)-Hi I 271 (0702)-Hill 326 [1199)- Hi II 322 (1394)-ridge west thereof (Avenue C).

4. Axis Hill 280 (0010)-Hill 262 (0803)-Hill 326 (1199)-Hill 322 (1394)-ridge west [hereof (Avenue 9).

b. Combat services Support Aspects.

(1) Personnel. Character istics of the society are such that only unskilled civil ian labor will be available at any time. Employment of civi I ian labor to meet short-term objectives must be balanced careful ly aga inat the long-term needs of harvesting rams in ing crops.

(2) Logistics. Lack of civilian food and SUPPI ias may impose added logistic burdens on our forces. Some pi I ferage can be axpected. Few resources beyond basic natural resources ara avai I able formi I i tary use.

(3) Civil-military operationa. Displacement of civil ians through the impressing of civil ian labor by the enemy and lack of food and supplies will create problems which, if not control lad, can impact on mi I i tary operations. The existence of civil agencies capable of assuming the functions of government will help al aviate the problem. However, these agencies will require guidance.

4. EFFECTS OF CHARACTERISTICS OF THE AREA.

a. Ef feet on Enemy Courses of Action.

(1) Effect on enemy defense.

(a) Tarrain now held by the enemy favors defense in depth from present positions to the division objective. The enemy has excel lent observation over al I Ms, and tha enemy's flanks ara protected by the rivers and canal on the west and artificial obstacles on the asst. The enemy's beet defense areas are the enemy-occupied forward PCS i t ions.

(b) The excel lent weather cond it ions favor enemy defense and permi t tha enemy to use supporting firea with maximum effectiveness.

(2) Effects on enemy attack.

(a) The enemy's beat *M is the* axis Hill 260 (0100) -Par is (9811)-Hi I I 364 (9613),

(b) Weather cond it ions are such that the enemy will not be able to maneuver toward our poe it ions without being observed except during tha hours of darkness. Tha lack of precipitat ion favors cross-country mobility.

(CLASSIFICATION)

Figure A-25. Example and explanation of analysis of the AO (continued).

Paragraph 3a(5) describes the AAs that are developed from all the previous analyses of the tactical aspects. Such development does not consider the disposition of the enemy forces. An AA must afford some facility of movement and room for adequate dispersion for a force large enough to have significant effect on the outcome of the operation. When either opposing force has available and adequate number of aircraft that can be used to deploy troops and equipment forward to the battle area and significantly affect the accomplishment of the mission, AAAs are listed. If terrain and weather conditions do not significantly influence choice of flight paths, then AAAs are not listed. Enemy AAs are listed first, followed by a list of AAs into the enemy battle area. When the opposing forces are not in contact, or when only security forces are in contact, AAs to the battle area for both forces are listed. Each listing of an AA is accomplished by a brief discussion to provide a basis for subsequent development of possible courses of action by either force. For CSS units, the discussion of AAs is based on rear area security requirements.

Paragraph 3b analyzes the facts listed in paragraph 2, and the subconclusions developed under tactical aspects. Indicate those facts and subconclusions that significantly affect CSS activities influencing choices of possible courses of action by either force or by requiring special activities to ensure adequate support. Omit any activity that is not significantly influenced.

Paragraph 3b(1) addresses personnel. Personnel management is of particular importance when weather and terrain conditions are severe, when the AO has a significant population and potential labor forces, and when political and economic conditions are unsettled.

Paragraph 3b(2) covers logistics. Logistics is of particular importance when weather and terrain conditions are severe, when the AO imposes additional logistic requirements and has significant resources of military value, and when political and economic conditions are unsettled. Coverage is particularly detailed for those commands accomplishing their mission by logistic support of other units.

Paragraph 3b(3) discusses civil-military operations. Civil-military operations are of particular importance in cold war, limited war, occupation operations, and when extensive civil affairs responsibilities have been assigned to the command. it is particularly important to tactical units when the numbers of civilians in the area present control problems and restrict use of fire power. Coverage is detailed for those commands with extensive civil affairs responsibilities.

Paragraph 4 contains the conclusions developed in the previous paragraphs. The conclusions are stated in terms of effects on the general courses of action available to both forces.

Paragraph 4a(1)(a) lists in turn, each significant possible enemy course of action, such as attack; defense; withdrawal; use of air, armor, nuclear fires, chemical agents, guerrillas, etc. Each listed course of action (using separate subparagraphs) is accomplished by a discussion, to indicate the characteristics of the area favoring the courses of action. For attack courses of action, indicate the best AA . For defense courses of action, indicate the best defense areas and, if appropriate, the best AA leading to the defense areas.

(CLASSIFICATION)

(3) Effect on enemy air,

(a) Weather and terrain favor enemy employment of air in the division AO.

(b) Terrain favors enemy delivery of nuclear weapons by low-level air attack.

(4) Effect on enemy use of nuclear weapons. Weather cond i t ions are favorable for enemy use of nuclear weapons. Ef fect ive winds do not favor use of fallout. Rol l ing terrain, numerous folds in the ground, and foliage will reduce thermal effects. Obstacles will be created by forest and tree blowdown.

(5) Effect on enemy chemical operations. Weather does not favor enemy use of chemicals. Terrain favors use of persistent chemicals in the valley forward of the enemy's present defensive positions.

b. Effect on Own Courses of Action.

(1) The best natural AA into the enemy area is axis Hill 280 (0010)-Hill 232 (0803)-Hill 326 (1199)-Hill 322 (1394)-ridge west thereof (Avenue D). It is blocked by extensive minefields.

(2) The second best AA is axis Hill 361 (97091-Hill 351 (9607)-Hill 359 (0004)-Hill 271 (0702)- Hi l l 326 (1199)-Hi l l 322 (1394)-ridge west thereof (Avenue A).

(3) Weather and terrain do not favor our attack. We will not be able to maneuver toward enemy posit i one without being observed except during the hours of darkness. The lack of precipitation will favor cross-country mobi l ity except below 200 meters elevation. Forest f ires end tree blowdown caused by use of nuclear weapons in Nationel Forest will restrict mobility, observation, and FofFs.

(4) Effect on nuclear weapons. Weather conditions are favorable for the employment of nuclear weapon. The rolling nature of the terrain, numerous folds in the round, and foliage will reduce effects on nuclear bursts. The wooded areas are dry and subject to extensive burning. Soil composition does not favor the production of high intensities of radioactivity. Winds generally favor employment by our forces of radiation effects of fallout from nuclear weapons.

(5) Effect of chemical agents. Weather conditions are favorable for our use of chemicals.

Figure A-25. Example and explanation of analysis of the AO (continued).

Paragraph 4b lists, in turn, broad courses of action that will accomplish or facilitate the accomplishment of the mission, such as attack; defense; withdrawal; or use of air, armor, nuclear fires, chemical agents, and guerrillas. Each listed course of action is discussed in the same manner as enemy courses of action.

Acknowledgement instructions included if distributed outside the headquarters. Normally, the word "acknowledge" is sufficient.

The signature block contains the name and rank of the commander and appears on all copies of the analysis if distributed outside the headquarters. If not distributed outside the headquarters, it is signed by the intelligence officer.

Authentication is required only if the analysis has not been signed by the commander and is to be distibuted outside the headquarters.

Annexes are listed by letter and title.

Distribution may refer to a standard distribution list.

PATROL REPORT

A patrol report is a written copy of verbal information reported following a reconnaissance or combat patrol mission. The battalion S2 generally prepares this report. Figure A-26 showa the patrol report format,

FRAGMENTARY ORDER

FRAGOs are extracts from more detailed orders or are issued to change previous orders. Like warning orders, these are usually brief oral or written messages. Mission orders are a form of FRAGOs which provide experienced commanders with the essentials of an order (such as a new mission or change to a peavious mission).

FRAGOs do not have a specified format; howaver, to ansure understanding, the OPORD format is useful. A FRAGO is issued orally or in writing. Those elements found in a complete order are omitted when they have not changed, are not essential, or are incomplete at the time of issue. As a general rule, a FRAGO--

- Is addressed to each commandar required to take action.
- Is addressed to higher and adjacent headquarters for information.
- Refers to a previous order. Indicates task organization changes.
- When necessary for clarity, includes a brief outline of the situation that generated the requirement for a FRAGO, to include a statement of the mission, if changed.
- Provides brief and specific instructions without loss of clarity.
- Requests acknowledgment.
- Contains proper classification.

With command approval, FRAGOs are prepared and issued by either coordinating or special staff officers with command approval. Figure A-27 shows an example of a FRAGO.

MISSION REPORT

The MISREP is used by all air units--strike or attack, reconnaissance or surveillance, airlift, observation, and helicopter--to report the results of all missions and significant sightings along the route of the flight. The MISREP amplifies the inflight report and is normally submitted within 30 minutes after aircraft landing to the tasking agency, the requesting unit or agency, and to other interested organizations. Upon completion of a tactical EW air task or mission, a debriefing is conducted by intelligence personnel, and a MISREP is submitted. Figure A-28 shows the MISREP format.

1. COMPOSITION AND DISPOSITION (see appendix 1, overlay). An overlay is usually attached to present the graphic display of enemy units. The initial subparagraphs always contain information pertaining to organization. Information concerning identification and disposition is listed by mentioning the highest echelons first, followed by subordinate units from left to right or top to bottom, as displayed on the overlay. Related items may be combined and presented in a single entry.

2. STRENGTH. Report information pertaining to enemy personnel, weapons, and equipment losses during the period. Replacement rates and strength figures of individual units may be listed.

3. TACTICS. Report only new tactics and deviations from prescribed tactical doctrine.

4. TRAINING. Report new developments and recent changes in training programs or methods of special training undertaken by the enemy since the initiation of hostilities.

5. LOGISTICS. Report those items which will affect current enemy operations, such as supply status, supply systems, and locations of supply facilities.

6. COMBAT EFFECTIVENESS. Report data on the combat effectiveness of enemy units, either of the entire force or of a major tactical unit., List items indicating morale, esprit, and quality of troops and commanders. Describe the ability of the enemy unit to accomplish its expected mission.

Annex B (OB) to PERINTREP 29, 3 Corps, 201800 August 1985

ORDER OF BATTLE

1. COMPOSITION AND DISPOSITION (see appendix 1 overlay).

a. All EPW captured during period are from the enemy 2d Combined Arms Army. Unit identification include--(C-l)

17 MRD	30 MRD	32 MRD
283 MRR	141 MRR	132d Med Tk Regt
290 MRR	142 MRR	
	130 Tk Regt	
	130 Recon Bn	

COMMENT. 32 MRD accepted as being organic to 2d CAA. 52 Tk Div previously accepted, completing organization of 2d CAA.

b. Two large missile-type weapons mounted on large amphibious armored carriers and several smaller vehicles identified in position vicinity MP 420513. (8-2) .

COMMENT. Probably elements of Free Rocket Regt, 2d CAA, previously unlocated.

c. Captured enemy field order reveals plan to attach 40 Tk Div to 2d CAA effective 22 Aug. (B-l).

COMMENT. EPW previously reported 40th Tk Div moving to reinforce 2d CAA. Enemy main effort probably planned for this area.

2. STRENGTH.

Enemy losses reported during period:

	EPW	KIA	ARTY	ARMOR	AIR	VEH
16 MRD	37	302	2	4	1	21
30 MRD	16	52	8	1	- - -	16
32 MRD	8	12	---	---	---	4
Total 111 US Corps Sector	61	366	10	5	1	41

COMMENT. The marked increase in personnel losses during the period have been sustained primarily by enemy combat patrols. Aircraft loss was HI, observation helicopter, equipped with aeronautics radar. Overall strength of 2d CAA is generally not affected.

(CLASSIFICATION)

Figure A-30. Sample OB annex.

(CLASSIFICATION)

3. TACTICS.

a. EPW from 16 MRD and 30 MRD state they have been instructed, in the event their units are cut off, to continue fighting as guerilla units or in small groups, live off the land, and destroy as much US Army property as possible before gradually infiltrating back to friendly lines. (C-6) .

COMMENT. Intensive guerrilla activity in our rear aress can be expected if elements of these units are cut off.

b. Enemy documents captured 07 Aug included a training pamphlet for battalion, company, and platoon commanders, written by GD Griboyedov entitled "Tanks Out Front,"' (appendix 3). It advocates tactics permitting US patrols and advancing forces to pass through aggressor lines. A coordinated tank-infantry attack is then made on open flanks and rear elements with tanks continuing momentum of attack to destroy remaining US forces. (B-2) .

COMMENT. Considering enemy doctrine that tanks are the decisive arm, the above tactic is possible, particular y in review of reports of probable employment of 40 Tk Div (para 1 .

4. TRAINING.

a. Reference paragraph 3b.

b. Indications of enemy concern for communications security (COMSEC) is noted in document captured from 2d CAA dated 10 Aug, directing all subordinate units to immediately initiate intensive training in radio security and communications procedures. (B-2) .

COMMENT. MI units confirm enemy lack of radio discipline and states that security violations increase during reinforcement and relief operations. Numerous enemy security violations have been noted since 17 Aug, further substantiating reinforcement or relief of 2d CAA units.

5. LOGISTICS.

a. EPW state enemy supply personnel have recently contacted local merchants, farmers, and fishermen for supplies of most class I items. (C-6) .

(CLASSIFICATION)

Figure A-30. Sample OB annex (continued).

(CLASSIFICATION)

COMMENT: Enemy either has critical shortage of class I items or has a bottleneck in the supply system requiring local procurement of these items.

b. Air and ground reconnaissance patrols have reported enemy stockpiling large quantities of supplies and equipment in rear areas of frontline divisions. (B-2) .

COMMENT. Not normal supply procedures. Significance as yet undetermined. Would indicate enemy may be planning major offensive soon.

6. COMBAT EFFECTIVENESS.

a. EPW from 16 MRD and 30 MRD state morale is high but senior officers are disgruntled because their units always receive difficult missions while the 32 MRD and 56 Tk Div have, until recently, been assigned lass hazardous missions. (F-6) .

COMMENT. Analysis of unit history and recent operations of enemy 2d CAA indicates it has usually been highly successful in combat. This, and the fact that 2d CAA has always had fine commanders, would account for high morale in units. This is first indication of dissatisfaction among officer personnel. Report seems cogent, however, since 32 Mech Div has not baen engaged in combat with US Forces in this campaign.

b. EPW reports 30 MRD to be redesignated 30 "Fusilier" Mech Div for superior combat record. (F-6) .

COMMENT. III US Corps rates combat effectiveness of 30 MRD from excellent to outstanding in comparison to other enemy divisions in same sector. 30 MRD casualties have been comparatively small; no deserters have been apprehended and its operations have been executed with determination.

7. MISCELLANEOUS DATA.

a. Personalities identified by EPW: (c-l).

CG, 40th Tk Div	GD GRIBOYEDOV, Semyon P. (Ref 3b)
CO, 282 MRR	Col CARDUCCI, Gherardo S.
CO, 283 MRR	Col UNDSET, Bjornstjerna (Acting CO)
CO, 130 Med Tk Regt	Col STEENWYK, Martin J.
CO, 132 Med Tk Regt	Cot MATTEZ, Mario

(CLASSIFICATION)

Figure A-30. Sample OB annex (continued).

(CLASSIFICATION)

COMMENT. Confirms previously obtained information.

b. Unit history. Officer EPW stated that unit (32 MRR) trained extensively in special tactics for assault of river lines. (F-6) .

COMMENT. Special training received by 32 MRD should increase its overall effectiveness when employed in river-crossing operations. No evidence of other units so trained.

c. Field post numbers: Captured document reveals enemy FPN being used as identification symbols on documents and messages. First two and last three digits are transposed. FPN of 46 MRD will appear as 75031 instead of 31750. (B-1) .

COMMENT. Enemy has employed this system previously as a security measure. Expect this system of transposing digits will occur in different patterns during future operations.

STANDARD COLLECTION ASSET REQUEST FORMAT

The standard collection asset request format (SCARF) is used for intelligence requirements tasking and for requesting information from higher or adjacent headquarters. At corps and division, intelligence requirements tasking is directed toward Ml commanders and commanders of other elements of the combat force capable of collecting the information.

Intelligence requirements tasking provides the selected unit with a specific requirement, but not with specific instructions for carrying out the mission. The SCARF specifies--

- The information needed.
- Where to look for the movers, shooters, sitters, and emitters.
- When to look.
- When the information is needed.
- What to look with, in some cases.

Figure A-31 showa the SCARF format.

A. Requester number.

B. Originator priority.

C. Activity or target type (area emitter and size (point, area, or unit)).

D. BE number, ELINT notation or case.

E. Location (if known or last known).

F. Ouration--

- Start date-time.
- Frequency.
- Stop date-time.
- Latest acceptable date-time for information utility.

G. Location accuracy--

- Required.
- Acceptable.

H. PIR and information desired.

I. Justification.

J. Remarks (to include disciplines and collectors recommended).

Figure A-31. SCARF basic format.

AERIAL RECONNAISSANCE AND SURVEILLANCE REQUEST

The aerial R&S request is used to request a tactical air reconnaissance or surveillance mission. The form states requirements, identifies needs, and, occasionally, specifies the actual air asset to perform the mission.

Any echelon initiates the request. It is used for both immediate and preplanned mission requirements. The requester oompletes section I of the request for each specific mission. Normally, these requests are transmitted by electrical means. The headquarters receiving the request adds information required to val idate or complete the request. Figure A-32 shows the aerial R&S request form. This format is the same as the format used for joint service operations.

Figure A-33. Alr reconnaissance request and task format.

Explanation of letter designators.

L. ORIGINATOR'S REQUEST NUMBER. The originator's request number usually consists of a unit identifier and a sequential numbering system. Commands may assign blocks of numbers to subordinate units to prevent confusion. if necessary to assist the tasking agency, commands also may establish a system of priorities for reconnaissance tasking and promulgate priority designators to be used in the originator's request number.

M. TYPE OF RECONNAISSANCE. Visual, electronic, weather, photographic, and so forth. Additionally, if the requester requires a specific type of sensor, system, or format to be used for some reason (such as a vertical photograph for briefing purposes), it is specified. Such detail generally should be omitted, however, to allow flexibility in planning and tasking.

N, MAP SERIES Z SHEET NUMBER. AND EDITION. Self-explanatory.

O. LOCATION AND DESCRIPTION OF TARGET. The target location or areas to be searched is indicated by the appropriate coordinate reference. The coordinate reference system used (for example, UTM grid, latitude or longitude) is identified clearly. Predetermined search areas or LOC segments can be nominated by relevant designators. A brief description of the target, its name and BE number (where known) should be included.

P. PURPOSE OF REQUEST AND REPORTING CODES. It is most important that tasking agencies and reconnaissance units understand the exact purpose of the request. Where possible, the code statements in appropriate reference books are used to identify the target category, reconnaissance purpose, and items to be reported. Otherwise, a plain language statement of purpose is provided.

Q. PHOTOGRAPHIC SCALE OR LIMITS. The photographic scale or limits should not be specified unless there is a specific reason for doing so; for example, survey photography or imagery is to be used for a particular task that requires it to be at a nominated scale or physical dimension. If the scale is nominated, care must be taken to differentiate whether the scale appl ies to the original film or to the end product requested (item R).

R. PRODUCTS REQUIRED. Specify the reports (RECCEXREP, IPIR, and any other end product) required. If photographs are required, specify quantities and the size or scale desired. Photographs should be requested only when essential and a report will not suffice. Quantities must be kept to an absolute minimum.

S. DELIVERY ADDRESS. State clearly where the report is to be delivered. For reports, nominate both action and information addressees.

Figure A-34. Explanation of letter designators.

T. DATE AND TIME LIMITATIONS. Specify any time constraints on the mission and follow-up actions. In particular, specify the date and time after which the information will no longer be of value. If the task cannot be accomplished by this date, it will be cancel led automatically.

u. SPECiAL INSTRUCTIONS. Give instructions or information not provided elsewhere that will aid in the planning or accomplishing of the mission. This includes control arrangements, communications, security instructions, details of own forces, or other pertinent entries.

v. TASKING AND MISSION DATA. This is completed by the mission tasking agency. It generally details the unit and number and type of aircraft. The mission number for the task is the originator's request number, abbreviated if necessary.

Figure A-34. Explanation of letter designators (continued).

SIGNALS INTELLIGENCE TACTICAL REPORT

The purpose of the SIGINT TACREP is to transmit combat information to fire and maneuver elements. It also is used to transmit technical data to traffic and analysis teams or to the TCAE. It is normally sent by electrical message or by secure FM voice radio means. it is designed to present highly perishable information in a clear, concise, and easy-to-read format. Distribution is made according to local guidance or as directed by higher commands. An annotated format is available in the classified appendix to FM 34-80.

MEACONING, INTRUSION, JAMMING, AND INTERFERENCE REPORT

The MIJI report is used to pass information from operators to their units about actual or suspected enemy attempts to interfere with, jam, or deceive voice, teletypewriter, or MC signals. The report is submitted by the operator whose communications means is affected, through the net control station (in the case of FM voice), to the unit's C-E officer. The C-E off icer coordinates this report with the EW officer, the intelligence off icer and the supporting MI unit.

MIJI reports are transmitted; however, if they are transmitted over nonsecure equipment, reports are encrypted using the brevity list. See FM 34-40 for additional information about MIJI reports and brevity lists. Figure A-35 shows the MIJI report format.

ORAL REPORTS

Briefings are oral reports that present information to commanders, staffs, or other designated audiences. The techniques employed are determined by the purpose of the briefing, the desired response, and the role of the briefer. There are four types of military briefings:

- Information briefing.
- Decision briefing.
- Staff briefing.
- Mission briefing.

The two most important briefing formats to intelligence officers and analysts at the tactical level are the information and decision briefings. An explanation of these two briefings follows.

INFORMATION BRIEFING

The information briefing is intended to inform and gain the listener's understanding. The briefing does not include conclusions or recommendations, or require decisions. The briefing deals primarily with facts. The briefer states that the purpose of the briefing is to provide information and that no decision is required. The briefer provides a short introduction to define the subject and to orient the listener and then presents the information. Figure A-36 shows the information briefing format.

DECISION BRIEFING

Decision briefings are intended to obtain an answer or a decision. They are used to present a staff officer's or intelligence analyst's recommended solution resulting from analysis or study of a problem or problem araa. They vary as to formality and detail depending on the level of command and the-decision maker's knowledge of the problem or problem area. In situations where the person receiving the briefing has" prior knowledge of the problem and some information relating to it, the briefing normally is limited to a statement of the problem, essential background information, and a recommended solution. However, the briefer is prepared to present the assumptions, facts, alternative solutions, or reason(s) for choosing the recommended solution, and any coordination required. If the person who is being briefed is unfamiliar with the problem or the facts surrounding it, then a more detailed briefing is necessary. In this case, the briefing includes any assumptions used in analyzing the problem, facts bearing on the problem, discussion of the alternatives, conclusions, and the coordination involved.

1. **INTRODUCTION.**

a. Greeting. Use military courtesy, address the person(s) being briefed, and identify self.

b. Classification. Announce the classification of your briefing.

c. Purpose. Explain the purpose and scope.

d. Procedure. Explain any special procedures such as demonstrations, displays, or tours.

2. BODY.

a. Arrange main ideas in logical sequence.

b. Use visual aids correctly.

c. Plan for effective transitions.

d. Be prepared to answer questions at any time.

3. CLOSE.

a. Ask for questions.

b. Concluding statement.

c. Announce the next briefer, if any.

Figure A-36. Information briefing format.

In the introduction, it is stated that the briefer is seeking a decision. At the conclusion, if the briefer does not receive a decision, the briefer asks for it. The briefer should understand the decision thoroughly. If there is uncertainty, the briefer asks for clarification. In this regard, a precisely worded recommendation that is used as a decision statement, once approved by the commander, assists in eliminating possible ambiguities. Following the briefing, if the executive officer is not present, the briefer informs the next highest ranking officer or the staff secretary of the decision. Figure A-37 shows the decision briefing format.

1. INTRODUCTION,

a. Greeting. Use military courtesy, address persons being briefed, and identify self.

b. Classification. Announce the classification of the briefing,

c. Purpose. State that the purpose of the briefing is to obtain a dec sion and announce the problem statement.

d. Procedure. Explain any special procedures to be used, such as add itional briefers. Omit if not required.

e. Coordination. Indicate what coordination has been accomplished,

2. BODY.

a. Assumptions. Must be valid, relevant, and essential to a solution to the problem. Omit if there are none.

b. Facts Bearing on the Problem. Must be supportable, relevant, and necessary.

c. Discussion. Analyze courses of action. Use smooth transitions between discussions of each course of action.

d. Conclusions. Degree of acceptance or order-of-merit for each course of action.

e. Recommendations. State actions recommended. Must be specific, not a solicitation of opinion.

3. CLOSE.

a. Ask for Questions.

b. Request a Decision.

Figure A-37. Decision briefing format.

APPENDIX B

AUTOMATION SUPPORT TO INTELLIGENCE ANALYSIS

During the past forty years, the battlefield has evolved from a relatively simple environment to one that is increasingly sophisticated in terms of collection systems and communications capabilities. Current collection systems incorporate state-of-the-art components and advanced technology. Deployed using Army-approved doctrine against known enemy capabilities, they exhibit the ability to collect vast amounts of information from a battlefield environment rich in enemy targets. Parallel advances in communications capabilities complement sensor system advances and provide the ability to transmit information faster and more efficiently than at any other time in history.

As the information flow increases, progressively more time is needed to identify, verify, and organize the information needed to produce intelligence. Yet, intelligence production methods and procedures have not kept pace with the advances made in collection systems and communications. Information collected by technologically advanced sensor systems and sent and received over high-speed communications equipment is still processed individually as it is received by manually sorting, recording, and filing it. Clearly, to produce the intelligence the commander needs, when it's needed, these manual processing functions must be updated and expanded.

This appendix describes how current and emerging automated systems support intelligence analysis. It will--

- Describe general computer system configuration and basic tactical military computer system capabilities and limitations.
- Discuss two current tactical semiautomated systems: MICROFIX and Intelligence Data Processing Set.

INTELLIGENCE ANALYSIS SUPPORT

ADP systems support efficient and timely intelligence production. This support upgrades the ability of analysts to deal with the vast amounts of information produced during the course of a battle. These systems are designed to supplement, not replace, existing manual analysis support systems. They provide expanded capabilities during the storage; access, retrieval , and manipulation; recording and record-keeping; and dissemination portions of the intelligence production process. These capabilities provide the analyst with substantially more time to devote to intelligence analysis.

Using ADP systems, the analyst not only stores more information in less space but the information is consolidated with other information and with previously produced intelligence. With this additional storage capacity, the analyst accesses data bases such as IPB or ground OB data from the same system. Consolidating this data onto one system lets the

analyst quickly and easily retrieve and manipulate the data and information needed to support the intelligence analysis process. With more information to work from, the analyst develops a better picture of the battlefield environment. This reduces risk and uncertainty.

ADP systems also provide the means to access this information quickly and easily. Data is accessed in seconds, rather than minutes or hours. By retrieving various types of information and using the computer capabilities to arrange this information in different patterns, information is manipulated to test previously established hypotheses or to create a new hypotheses based upon new or emerging patterns. Through this process of electronic comparison and contrast, the computer helps the analyst determine unit identifications, strengths, and enemy commanders' intent.

Computer system capabilities is used to facilitate and complement manual methods and procedures. For example, computers are programed to automatically record message header information into a separate file which subsequently is printed and placed in a three-ring binder. This provides a duplicate file that is easy to maintain and keep current and requires a minimum of time and effort. A record of all intelligence messages and products is printed. This establishes a record of all outgoing intel 1 igence products and messages, including a list of all users receiving that message or product. When manual recording is kept to a minimum, it leaves more time for the analyst to develop intelligence.

Another example of a manual system being eased with ADP is recording and storing preprogrammed formats. The computer assists the analyst in preparing a variety of reports, summaries, and other intelligence documents and message formats electronically. Once correctly formatted, previously created lists of addresses and users are selected and automatically printed. If electronic message sending capabilities exist, messages are sent directly from the terminal. This capability significantly reduces the amount of time necessary to prepare, route, and transmit products to users, and the amount of time the intelligence analyst spends preparing and disseminating them.

These tasks are continuous and require time and the ability to assimilate large amounts of data quickly and accurately. The use of ADP enhances the analyst's abil ity to perform these tasks. It is a tool which provides the analyst with the ability to access and use more information and resources than manual processes provide.

COMPUTER SYSTEM CONFIGURATION

Every computer system is composed of hardware and software. Hardware is the actual physical equipment--or components--that make up the total ADP system. Software is a series of commands, recognized by the computer. It tells the computer how to perform a variety of functions.

Typical system hardware consists of a keyboard; central processing unit; storage device (disk drive); display or monitor; and printer. These basic hardware components access files, input new information, manipulate data and information, and display or print data of information which the analyst selects to perform analysis and produce intelligence. Figure B-1 shows the basic computer components.

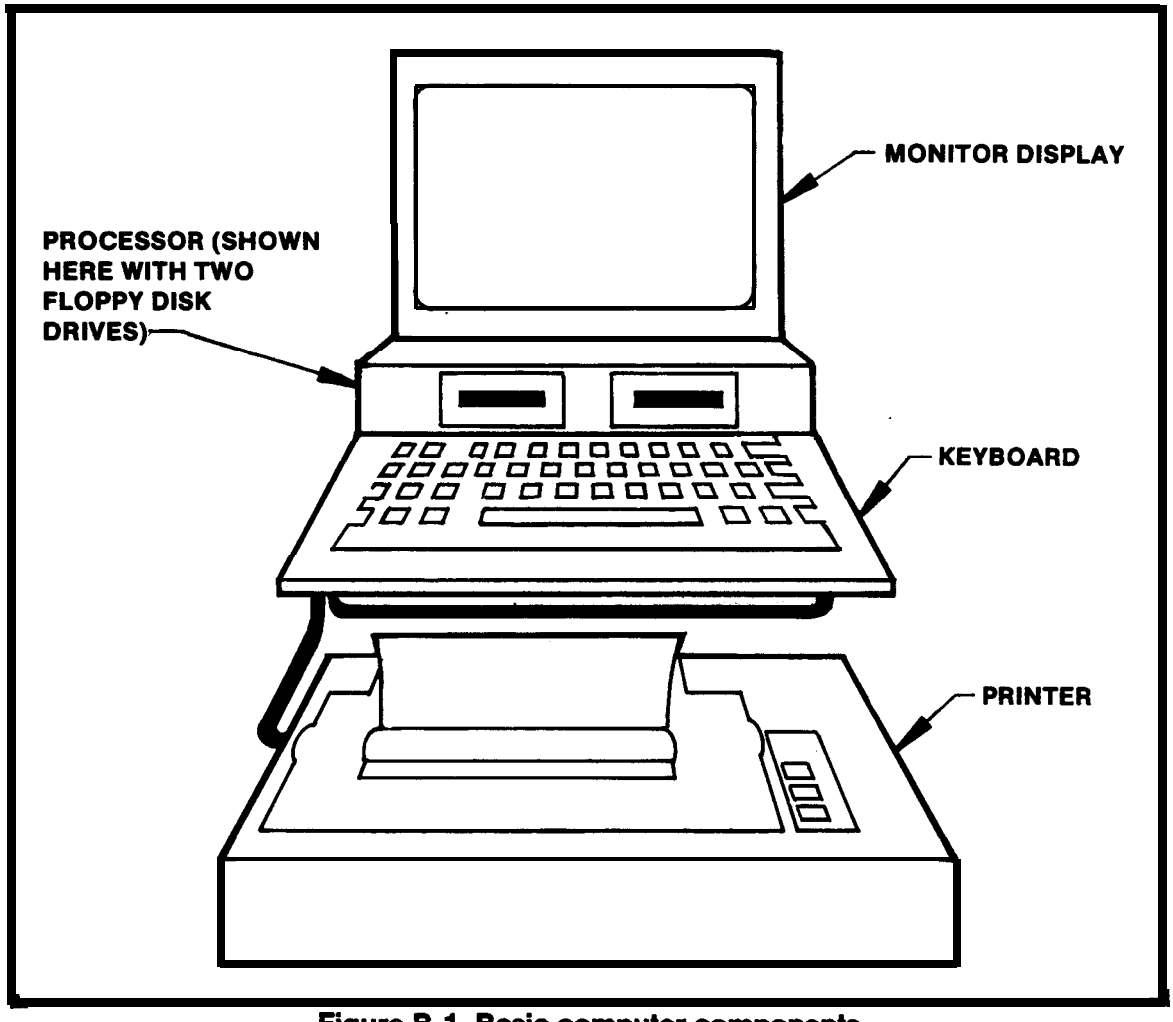

Figure B-1 Basic computer components.

Keyboard. The keyboard serves as the primary input device to the computer. Normally, the keyboard contains the same letters, numbers, and punctuation keys as a standard typewriter. The computer keyboard also contains special function keys which are used to initiate various computer functions.

Processor. The processor is the component that executes the commands from the programs. It controls the flow of information into, within, and out of the computer. It also contains a limited amount of the computer's memory.

Storage Devices. Information is stored inside the processor in special memory locations or in a separate storage device. Examples of storege devices are floppy or removable disks, magnetic tape, large capacity hard cartridge or fixed disks, and cassette tapes, or cartridges. The computer periodically reads these devices during each computing session in order to perform programs selected by the analyst. Conversely at the end of the computing session, data is saved to these devices if it is to be permanently retained. Information solely left displayed on the monitor or in the processor is lost when the system's power is shut off.

Display, The display is a cathode ray tube (CRT) (commonly referred to as a monitor). The monitor displays text, charts, graphs, or maps (depending upon system configuration and capabilities). It is similar to a television screen and is monochromatic or color.

Printer. Printers are similar to high-speed typewriters. Information from the processor is read and the output is printed on computer paper or bond paper. This provides the analyst with a permanent record (hard copy] of the information.

Peripherals

Other components are integrated into the basic ADP system to provide specialized or expanded capabilities. Whether or not components are added to a system depends upon several factors. First, the original system is designed so that it can be expanded. Second, expansion modules, add-on components, or peripherals are compatible with the existing system. Third, software limitations and design constraints are considered. Depending upon these factors, some of the following components are integrated into a tactical ADP system:

- Video disk players (VDPs). VDPS al low map, text, photographs, or any information that can be stored on video disks to be displayed on a monitor.

- Modems and communications networks. This equipment allows information to be passed directly from one computer to another. The modem connects directly to the telephone jack and transmits and receives data through telephone lines. Provides interface between data processing systems over communications lines. Paper tape reader/punch (PTR/P) devices provide the capability to generate and read tactical RATT messages via paper tape.

- Video cassette recorders (VCRs). Identical to VCRs used for home entertainment, some systems have programs that al low a VCR to be connected to the processor for use as a back-up and restore device.

Software

Software provides the instructions, tools, and basic programing required for computer system functions. There are many types of software; however, every system must have an operating system to be able to function.

Operating System Software. This software enables the computer to run applications. This operating system, which also is referred to as a control program, is thought of as a traffic cop. It regulates all actions within the processor and determines when any of the peripherals are activated. Another vital function performed by the operating system is to act as a translator between the users' language (English, German, Spanish) and the computer's language (binary).

Data Base Management Systems (DBMS) Software. DBMS software turns the computer into a high-powered, automated filing cabinet. This data base file is sorted on nearly any variable in the file's structure. The computer also extracts records in the file that match a very exacting criteria, or extract just selected bits of information (fields) about all the records in the file. This allows the analyst to manipulate data in varying ways to get a clearer picture of the battlefield and perhaps identify previously unrecognized patterns.

Word Processing Software. A word processing program turns the computer into a high-powered, automated typewriter. This software gives the analyst the ability to compose briefings, reports, and messages, and to perform editing functions for storage, printing, and display.

Applications Programs. These programs are the actual commands that perform the automated operations the analyst requires. These are written in a DBMS or computer language. Some common languages are BASIC, PASCAL, and FORTRAN.

ADVANTAGES AND DISADVANTAGES

Advantages and disadvantages depend on the system, software, and training. The analyst uses the ADP system to store and manipulate facts or data that, when analyzed, produce intel I igence.

Advantages

In general, for any system, the advantages of automated support to intelligence analysis lie primarily in the areas of information management and dissemination. ADP systems help the analyst disseminate information with speed and increased accuracy.

Speed. ADP support is particularly useful to the analyst because of the speed at which computers can perform calculations and assemble specific data from a large body of information. Given accurate data input, the computer produces a faster, more accurate output than is obtained through human calculation. Stress or pressure do not degrade ADP operations. They carry out prespecified tasks almost indefinitely. A caution about

computers being more accurate than humans working in a purely manual mode. Humans respond almost instantly to questions requiring a judgmental response: "'What are the 10 most significant actions in the last 12 hours?"' The computer cannot make such a response. To a computer, a report about the movement of the independent tank battalion carries the same weight as a report about three wheeled vehicles moving along an unidentified road.

Report Generation. When ADP systems are equipped with word processing capability, the analyst creates reports, messages, summaries, or other intelligence-related documents quickly and easily.

Electronic Communication. If ADP systems are netted, that is, linked together, data is transmitted directly from terminal to terminal. If they are not netted, a messenger sends correctly formatted diskettes, as well as hard copy reports. However, diskettes offer the advantage of being able to be loaded into the receiving person's computer. In any case, copies of the message are produced and then transmitted over established tactical communications channels. In either event, the ability to disseminate intelligence products is substantially improved over more traditional methods of dissemination.

Disadvantages

Understanding the System. Most of the disadvantages of ADP support to intelligence analysis result from a lack of computer literacy or an understanding of specific ADP system limitations and capabilities. Analysts and commanders tend to assign capabilities to the system that it does not possess. This results in an unrealistic view of the support ADP provides to the commander and creates a false reliance on the computer system by the analyst.

Computers perform only those functions they are explicitly told to do. They do not learn from mistakes, nor will they correct improper input. Therefore, the data stored in the computer is only as accurate as the data that is entered. Computers also have a finite capacity to store data. Design parameters establish this capacity. While additional storage capacity is provided by add-on component storage equipment, when maximum storage limits are reached, old data is deleted to make room for new input. Dual record-keeping procedures, both manual and automated, are established and kept in an updated status. If ADP capabilities are interrupted or lost, this ensures that intelligence production continues.

Multi-Processing. Another disadvantage is that some tactical systems cannot input, process, and output data simultaneously. Others only allow access to a shared data base on a one-by-one basis. Therefore, the analyst determines which data is most important and balances input, output, or access functions to best support the mission. This is critical to appropriate and maximum use of the ADP system.

Environment. Computers also are vulnerable to environmental conditions and influences like temperature extremes, weather conditions, power fluctuations, and power outages. Terrain constraints also may affect ADP access, system mobility, or system capabilities.

Temperature extremes, like alternating very hot and very cold weather cause condensation. Condensation inhibits the read and write ability of the system. Extreme temperatures also result in partial or complete loss of previously input data. For example, rain, fog, and high or low humidity cause partial or even complete system failure.

Static electricity also results in partial or complete loss of data. Planned power outages require shutdown of all computer functions immediately before and during the length of the outage. Unplanned power outages or power surges not only shut down computer functions, but also result in varying degrees of hardware or software damage or data loss.

Severe weather conditions, like lightning or dust storms, produce the same effects as unplanned power outages or power surges. Dust in the read and write heads of hard and floppy disk drives result in inaccurate input, output, data loss, or total destruction of disk capability.

Terrain also is a factor in ADP system survivability and use. Each time the system is moved, leveling is required before the system is operational. Crossing rough terrain under highly mobile conditions partially damages or completely destroys the ADP system. Also, while mobile, current systems are inoperative. Data accumulated while the computer system is down or inoperative must be saved and input when circumstances permit. This means that when the system initially returns to an operational status, it does not provide data for irrrnediate analysis until the data base has been updated. If the accumulation of data is such that input requires a substantial amount of time, the analyst finds that manual systems and data bases support the commander's intelligence needs more efficiently.

Many of these disadvantages apply, in whole or in part, to all tactical battlefield electronic and automated systems. When the capabilities and limitations of ADP systems are thoroughly understood, measures are taken to protect the system while making maximum use of ADP support to intelligence analysis. By taking these factors into account, ADP support to intelligence analysis is a viable tool which the analyst uses to give the commander a more complete, accurate, and timely picture of the battlefield.

CURRENT AUTOMATED SUPPORT SYSTEMS

The US Army currently has two systems deployed specifically to support tactical SIGINT and all-source intelligence analysis functions: the MICROFIX and the TCAC. The MICROFIX assists the analyst in fulfilling the commander's need for information and intelligence on the AirLand Battlefield. The TCAC provides a variety of SIGINT and EW asset mission management functions, as well as to assist the analyst. Both of these systems are designed to enhance the analyst's ability to manipulate large quantities of unprocessed or partially processed data. Information is quickly and easily added, deleted, or moved. Historical enemy locations, enemy strengths, equipment, and unit designations, and specific enemy equipment capabilities and limitations are accessed from previously stored data base information. In fact, the analyst accesses data that is limited

only by storage capability, the data bases available for review, and the information or data the analyst elects to input into the system during the course of the battle.

Since the TCAC system is found only in USAREUR and XVIII Airborne Corps, (and is a non-TOE--table of organization and equipment--item) this manual does not address it in detail.

MICROFIX

MICROFIX was introduced into the Army as a training device. The system exists to provide MI soldiers an opportunity to become familiar with computers before future automated systems, such as the all-source analysis system (ASAS), are introduced. The purpose of MICROFIX also is to support the tactical analyst, as OB analyst (96B), SIGINT analyst (98C), counter-SIGINT analyst (97G), CI agent (97B), or a terrain analyst (12 CMF). The MICROFIX gives the analyst the capability to input data into complex data bases. The analyst manipulates this data to provide a source of accurate and frequently updated knowledge about past and present enemy activities. This information assists the analyst in determining enemy courses of action and developing counter-strategy. The MICROFIX system also produces various reports and data files which are generated by the analyst. The system is menu-driven (all the user's options are on the screen at all times) and quite easy to use. Figure B-2 shows the MICROFIX system.

The system is based on the Apple II Pulse Microcomputer and incorporates other off-the-shelf components. TEMPEST engineering provides emission security between components of the system. Expansion cards provide the capability to control a large amount of peripheral equipment in the field environment. Figure B-3 outlines the hardware components of the MICROFIX system.

Figure B-4 shows further details regarding the eight basic components of the MICROFIX system. The MICROFIX is mounted in an AN/TYQ-5 data analysis center or in any shelter, tent, or building the G2 considers appropriate. Since both power boxes, the power conditioner, and the standby power supply, have surge protectors, the system is powered by either commercial power or a filed generator. Both styles of VDP and power box are shown, but only one VDP and one power box comes with each system.

In addition to the eight basic components shown in Figure B-4, two special components are available. The VCR and PTR/P are issued on a 1:3 to 1:4 ratio; one component for every three or four MICROFIX systems. The VCR is used to backup and restore the entire 20 megabyte memory of the hard disk. The PTR/P is used to cut a five or seven band of paper tape. The message is generated in the system's word processor (Wordstar) and, once properly edited, the MICROFIX system cuts the tape. Figure B-5 provides details on these two components.

1. **HARD DISK SYSTEM.** The Corvus 20 megabyte hard disk drive assembly stores and mantains system software and the master data base.

2. **MONOCHROME MONITOR.** The monochrome monitor displays MICROFIX TEXT on a screen in green or black.

3. **COLOR MONITOR.** The amdck color monitor displays color graphic data. This includes video disk maps and military symbology.

4. **PRINTING.** The Apple Dot Matrix Printer operates at 120 characters per second (CPS) and has graphics capability.

5. **VIDEO DISK PLAYER.** The VDP reads photos or map sheets from a laser disk, using the same technology as used on a compact disk player. The photos of the map sheets are displayed on the color monitor.

6. **APPLE II PLUS MICROCOMPUTER.** The microcomputer is capable of controlling a large complement of peripheral equipment while operating in a field environment.

7. **KEYBOARD.** The keyboard assembly uses a full 128 ASCI character set, joystick and enhancer board. This equipment provides upper and lower case letter and number capability, in addition to auto-repeat keying.

8. **POWER BOX.** The older grey power conditioner has eight outlets on its top, assure protector and the capability to work with 110 or 220 volts. The newer green standby power supply has six outlets in the rear panel, a surge protector, a built-in battery pack capable of providing 20-25 minutes of uninterrupted power but works only with 110 volts.

9. **VIDEO CASSETTE RECORDER.** (Not shown in Figure B-2.) The VCR is used to initialize the system (hard disk) and acts as a backup or restore device for the hard disk drive assembly. This expands the potential data base capability of MICRO FIX. The VCR initiatea hard disks and backups which are quicker and easier to use than floppy disks. VCRs are issued with every three to four systems, or one per installation.

10. **PAPER TAPE READER/PUNCH.** (Not shown in Figure B-2.) The paper tape reader/punch (PTR/P) punches a paper tape coPy of messages prepared on the MICROFIX for transmission over tactical RATT systems. It also reads paper tape. PTR/P equipment is issued with every three to four systems, or one per installation.

Figure B-3. MICROFIX hardware components.

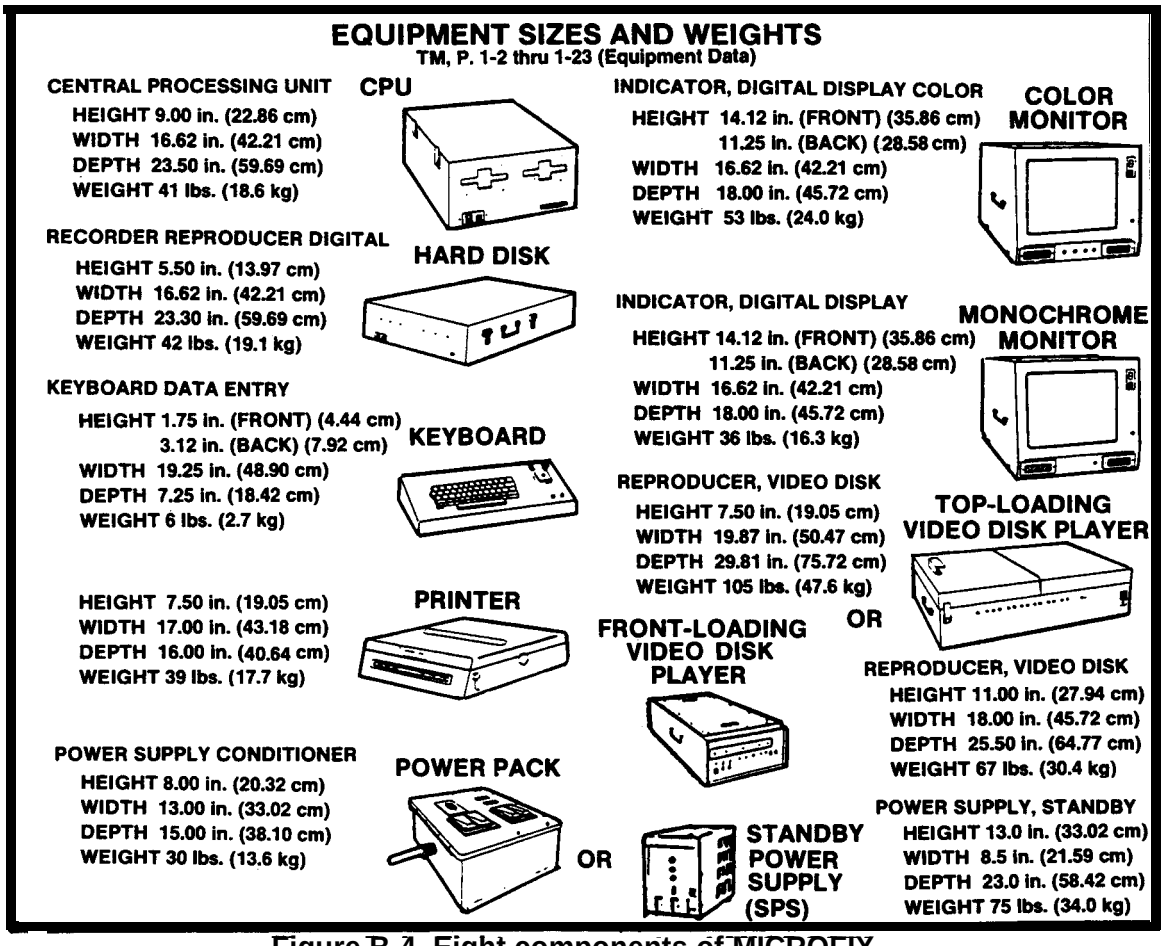

Figure B-4. Eight components of MICROFIX.

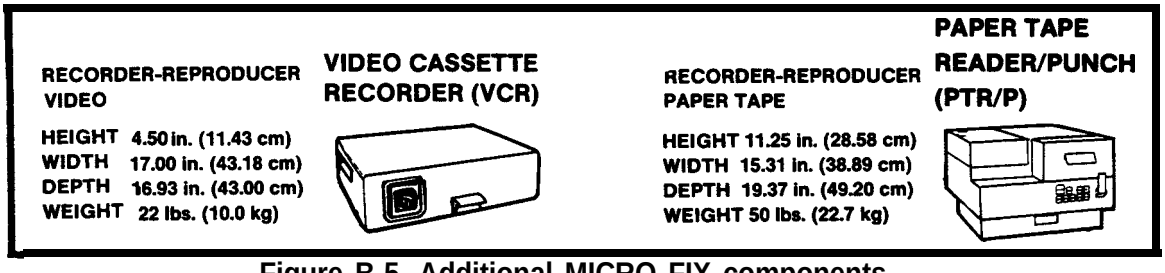

Figure B-5. Additional MICRO FIX components.

MICROFIX SOFTWARE

MICROFIX software provides analysts with the ability to collect, consolidate, and retrieve information in the area of all-source production, SIGINT, counter-SIGINT, OPSEC, and topographic analysis. The analyst uses MICROFIX software to organize information into categories which facilitate rapid and meaningful analysis. The MICROFIX software provides the ability to manipulate records in various data bases, display tactical overlays on the color monitor, cross-correlate data from different data bases, and print reports. Figure B-6 shows the baseline software (those files which are found on all MICROFIX systems).

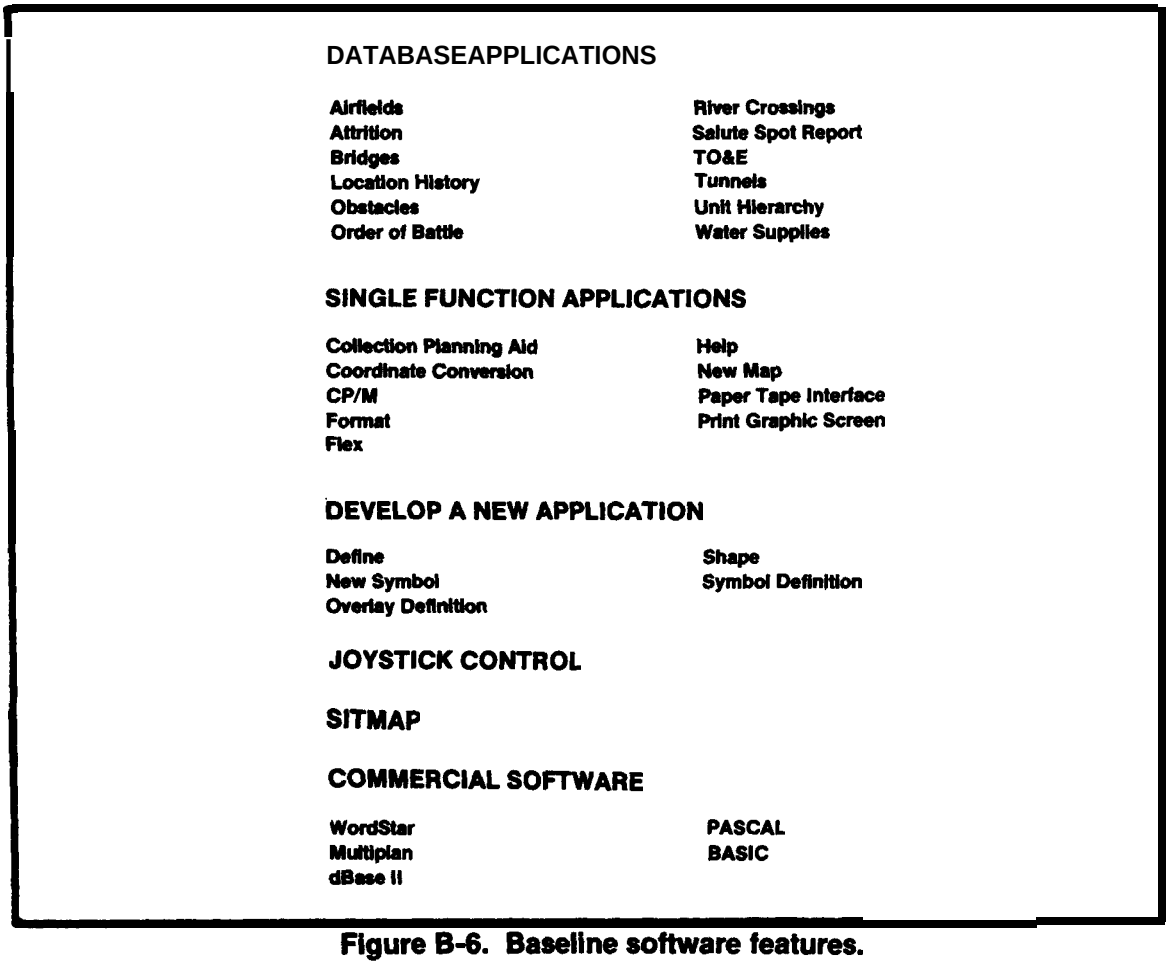

Figure B-6. Baseline software features.

The primary advantage of the MICROFIX system is that it provides the tools to manipulate and retrieve data quickly and accurately. It gives the analyst the ability to access a much larger collection of data with more speed than manual systems provide. New information is added to existing data bases, new data bases are created, and old or inaccurate data are deleted. Graphic overlays allow the analyst to visually test theories and develop or discard hypotheses. Hard-copy printouts of text information, produced at each developmental stage of the analysis process, provide verification of the logic used to develop the final intelligence products and also serve as source documents for historical record-keeping purposes.

Figure B-6 shows all the applications that constitute the software package known as the all-source production system (ASPS). The baseline software package forms the foundation for all the other configurations. The additional software packages are explained in the order in which they were released.

Topographic Workstation

Members of the terrain analysis team use the topographic workstation. The topographic software has all the applications of the baseline plus two topographic-specific applications: Topo and Topows. These applications allow the user to use digital terrain mapping features (tinted elevation, slope, or speed overlays; LOS profile; oblique view; perspective view and visible area plot); weather and environment features (sun rise and set, phases of the moon; NBC and smoke calculations; affect of weather on night vision devices, electro-optic sensors, and density altitude calculations); and a mobility calculator for friendly and enemy wheeled and tracked vehicles.

Technical Control and Analysis Element Workstation

SIGINT analysts use the TCAE workstation. TCAE software has all the applications of baseline software PIUS five SIGINT-specific applications:
